CERTIFICATE OF AUTHENTICITY

This microfilm was created from the record copy of unit histories and related historical material of the United States Air Force stored in the Archives Branch of The Albert F. Simpson Historical Research Center at Maxwell AFB, Alabama. This facility is the official repository for these records in accordance with AF Regulation 210-3 and AF Manual 12-50. This microfilm was created in accordance with the provisions of AF Regulation 12-40 as AU Project AU-1B-67. The microfilming was completed under AF Contract F01600-71-C-0478 under the supervision of the Technical Systems Branch of The Albert F. Simpson Historical Research Center.

U. S. WEATHER BUREAU

Arctic Operations Project

Eureka Sound Installation

- General Operations -

PURPOSE - To establish a weather station at the most favorable location to be found adjacent to Eureka Sound, N.W.T., Canada, between latitudes 79°30'N and 80°30'N. In view of the difficulties of transportation to this area the program will be divided into three parts.

SPRING AIR PROGRAM - Installation of basic camp, radio, and weather observations equipment, with supplies for minimum of 5 months or up to capacity of the air lift.

SUMMER AIR PROGRAM - Reinforcement of basic camp and delivery of supplies to bring level up to one year.

AUTUMN SHIP PROGRAM - Installation of addition to basic camp two men, with rawinsonde equipment (one observation per day) and supplies for support of additional men.

SPRING AIR PROGRAM - To be accomplished by air transport from Thule, Greenland, during the spring flying period (March-May, 1947). Air craft, air crews, and flight control to be provided by the U. S. Army Air Forces. All other personnel and equipment to be provided by U. S. Weather Bureau and Canada. Air craft will be landed on ice surface of Eureka Sound for delivery of special equipment and personnel. Some bulk items may be delivered by parachute. Camp to be constructed adequate for limited station activities through the following summer. Spring Air Program includes reconnaissance, etc., as detailed in accompanying instructions. Air transport operations to commence with first favorable weather (estimated early April) and to continue until either weather becomes predominantly unfavorable, ice landing conditions deteriorate, available aviation fuel supplies are exhausted or full scheduled air-lift is complete. (estimate late May). If flight operations prove successful larger supplies of consumable stores will be transported during the Spring Program.

SUMMER AIR PROGRAM - To be accomplished primarily by air parachute delivery from Thule, Greenland, during the summer after adequate supplies of fuel are delivered to Thule by surface ship, (August-September). Aircraft to be equipped for parachute discharge. Extent of the Summer Air Program will depend on the amount of supplies successfully delivered by the Spring Program, and will bring up the supply level of all items to one year.

If sufficient open water is found in the vicinity of the station site in Eureka Sound it may prove feasible to use a flying boat (OA10 or equivalent) during the Summer Program for delivery of some supplies which might otherwise be damaged in parachute drop. If operations are sufficiently successful to this point, and adequate supplies can be delivered to Eureka Sound, additional Personnel may be transported by flying boat.

THIS PAGE IS UNCALSSIFIED

At termination of the Summer Air Program (September) a station will have been established having adequate buildings to withstand the ensuing winter, with supplies sufficient to last until the following September 1948, (representing 100% factor of safety since it would be expected to re-supply in April), and with radio for schedules to Thule and meteorological equipment for surface observations and limited upper air soundings.

AUTUMN SHIP PROGRAM - To be attempted by surface ship (ice-breaker) during the late summer. (August-September, 1947). The purpose is to build up the function of the Eureka Sound station to permit one upper air observation daily. Supplies to be delivered must be confined within the capacity of the ice breaker, being principally deck load, and will consist principally of additional camp building, rasonde and rawind apparatus, rawind shelter, gas generators (or helium), food for 3 or more men for 12 months, fuel, miscellaneous small stores.

On successful completion of the Autumn Program station to consist of approximately 7 men with equipment for 4 surface synoptics, one rawinsonde daily, and supplies for a year. If the Autumn Ship Program should fail to reach Eureka Sound the station will remain at 4 men with surface observations and limited upper air (raob) soundings.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

GEOGRAPHICAL

Reference is made to description by Sverdrup, MacMillan, Cook, and to aerial reconnaissance in 1946 as far north as Depot Point. Charts to be used will be AAF, aeronautical charts, scale 1-1,000,000, sheet 7,20 and 21. Nomenclature will in general follow the names given by Sverdrup, with translation of the Norwegian to English where appropriate.

Entering the Eureka Sound Area from Thule one first crosses the Ellesmere Island Coastal Mountains. The ice cap of these mountains declines westward and terminates usually on the land without substantial discharge toward Eureka Sound. The country between the coastal mountain and Eureka Sound is rough and rugged and varying from 2000 to 5,000 feet, estimated. It is not believed that the pass shown on chart from Bache peninsula into Bay Fiorde is as represented. Descriptions indicate that this pass crosses the divide at several thousand feet and is extremely narrow, which description was confirmed by visual aerial reconnaissance. Rough country extends to Eureka Sound altho becoming lower in the west. This is believed to be a transition formation between the bold sandstone formation as found at Thule and the eroded limestone formation of the western Canadian Islands. Looking westward across this area one finds typically bold and barren arctic country breaking down toward the waterway of Eureka Sound and backed abruptly by the high snow clad peaks of the Axel Heiberg Mountains. Moving northward through Eureka Sound from Baumann Fiord the east or Ellesmere Island shore line in generally bold and unpromising except for occasional valleys and deltas. On this side it is believed that the country becomes less promising with higher latitude, and that the Fosheim Peninsula is mountainous to the sea except for some broad valleys. On the Axel Heiberg side the coastal area becomes more promising in higher latitude up to Depot Point and probably up to Schei Island. Big (Stor) Island has relatively gentle foreshore on the northeast. The coast of Axel Heiberg is here a series of gravel plains, sloping to the water and cut by numerous straight brooks and rivers. The slope of these plains may be considerable but it is believed that favorable camp sites undoubtedly exist. Depot Point is apparently all low and rolling, and Sverdrup speaks of extensive stretches of flat country around Muck Fiord. Evidence of suitable open country further north is inconclusive altho there are references to grassy and low terrain.

In early September 1946, a light snow cover covered the hills above an altitude estimated at 1,000 feet while below this level the ground was bare.

WEATHER - There is evidence that considerably lower temperatures must be expected in the spring in Eureka Sound than are found at Thule. Sverdrup speaks of temperatures of -57°C in late March and very low temperatures persisting well into April. This is confirmed by MacMillan and Cook.

March is described as very windy with frequent gales and much blowing snow. The persistence of clear still days increases rapidly however and MacMillan states that from the 15th of April to the 15th of May one can expect a majority of bright, sunshiny weather. Temperatures throughout April and May will be moderating but will be probably remain below freezing consistently and it likely that the first thaw will not occur until middle of June.

THIS PAGE IS UNCALSSIFIED

After the appearance of open water in summer it is usual to have a predominance of rather low stratus. It is quite possible that Eureka Sound itself may remain relatively clear, at least with broken stratus layer, because of the high mountains of Axel Heiberg Island protecting on the west and north. This is conjecture. It is believed that stratus will be found prevalent against and across the Ellesmere Island coastal mountains on the flight route from Thule.

ICE CONDITIONS - During aerial reconnaissance in September 1946 Eureka Sound was all open water to the limit of our visibility and approximately as far north as the junction with Nansen Sound. This offers the formation of very large areas of new, smooth ice for the spring of 1947 if pressure influences have not developed to disturb this ice during the past autumn. The appearances of vast stretches of ice "as flat as a floor" is confirmed by MacMillan. It is believed that satisfactory ice flying surfaces will be found, especially in any sheltered location.

Sverdrup's experience does not wholly confirm the persistence of large areas of flat ice. He speaks of many pressure ridges running across the Sound at intervals and of areas of rubble ice. Also Sverdrup found rough ice in the northern part of Eureka Sound and Nansen Sound. It appears probable that Sverdrup conditions were the result of a bad previous year when Eureka Sound had not wholly cleared of ice or where severe pressure crushed the ice in the autumn. This suggests that the open water found in September 1946 may not be an annual occurrence. It is of interest that next year should be favorable with reference to ice formation. It should be particularly noted, however, that we have evidence of large differences of ice character and that the selection of the 1947 ice flying facilities should take into account the possibility of more serious conditions in a subsequent season. Selection must take into account protection against future pressure and accumulation of residual ice.

The waters of Eureka Sound were sufficiently open in 1946 to offer little or no hazard to surface navigation, but nevertheless carried considerable quantities of drifting ice and small areas of pack. Residual fragments will undoubtedly be found imbedded at random in any new ice surface. Fragments are believed to be sufficiently scattered to permit the selection of adequate runways without difficulty.

SNOW CONDITIONS - Records do not show the annual precipitation, or the average depth of snow to be expected. Sverdrup frequently speaks of heavy going in deep snow. On the other hand he also speaks of large areas of bare ice. The distribution of snow will depend primarily on the wind, but records do not show a marked predominance from any one direction. Southerly winds may, if anything, be the more severe. Heavy drifting must be expected. In the selection of the camp site it will be desirable to find protection from extreme winds but it will also be necessary to avoid construction in a pocket where very deep drifts may accumulate. The airstrip should be located where local conditions indicate a minimum of snow depth.

THIS PAGE IS UNCALSSIFIED

AIR ROUTES, THULE TO EUREKA SOUND

For air-lift to Eureka Sound two practicable routes are available (See AAF Aero. Charts scale 1-1,000,000 Nos. 7, 20 and 21). A third route is also possible under certain conditions. The one which appears to be the best for low ceiling conditions is as follows: From Thule follow a course of 283° TRUE to a point near the mouth of Vendome Fiord, Ellesmere Island Lat. 77°30'N, Long. 83°35'W. This course crosses the lowest pass on the Southern Part of Ellesmere Island, i.e., from Makinson Inlet to near the head of Baumann Fiord. The divide across this pass is less than 3000 feet elevation. Therefore air passage can probably be made with a ceiling of 4500 feet. The route continues on a course of 345° TRUE from a point near the mouth of Vendome Fiord to the vicinity of Schei Island, where it is believed the station will eventually be located. This route has the advantage of the lowest passage across Southern Ellesmere Island and at no time will the plane have to fly over high mountains. Its total length is approximately 450 statute miles from Thule to assumed position of Eureka Sound Weather Station.

A second route would utilize the pass between Flager Fiord and Bay Fiord lying just north of the 79° parallel. This pass is rather high and narrow and not suitable for planes under less than about 1500 feet clearance above the terrain. The map showing the pass is rather deceptive since it is actually a long narrow river canyon with high precipitious walls and ramparts. Moreover the map shows the pass to be less than 1000 feet elevation which does not at all agree with comments of explorers and observers who have seen this pass. This route would start from Thule on a course of 315°T and continue to Hakluyt Island lat. 77°25'N, long. 72°40'W a distance of 85 statute miles; thence up Smith Sound on a course of 340°T for a distance of 120 statute miles to a point in Buchanan Bay lat. 79°N, long. 75°31'W., thence 275°T for 125 statute miles along Knud Peninsula and over the pass between Flagler and Bay Fiord to the head of a small fiord on the E. side of Eureka Sound in lat. 79°10'N., long. 84°50'W., thence 337° True for 90 statute miles to the northwestern tip of Schei Island, the assumed position of the station. The total distance scaled from the map is 420 statute miles. It would very likely require a flying altitude of about 5000 feet to safely cross the pass, consequently the route would not be satisfactory if ceiling was 6000 feet or less. On the other hand it follows closely the routes of explorers crossing Ellesmere Island and therefore it would simplify rescue in case of accident.

A third possible route is a direct course between Thule and the assumed station site. This requires a course of 315° T and 375 statute miles. Although it is the shortest possible route it has the disadvantage of crossing the greatest heights on the southern part of Ellesmere Island which requires a flying altitude of about 8000 feet to clear the land by 1500 feet. This would be satisfactory in good weather with ceiling over 10,000 feet especially on the return trips. In any event a certain amount of reconnaissance should be done prior to final selection of air-lift route.

SEA ROUTES

According to existing records no ship has ever entered Eureka Sound. This is generally due to the fact that all approaches to Eureka Sound are blocked with ice too heavy for ships of the traditional type used in

THIS PAGE IS UNCALSSIFIED

in arctic waters for earlier exploration. Since the successful journeys with the USCG NORTHWIND during the summer of 1946 it is believed entirely possible to achieve passage into Eureka Sound with a powerful ice-breaker. Observation of much of the Sound itself during September 1946 found it almost entirely free of ice and readily navigable. The problem is therefore to obtain passage thru the approaches to the Sound. This does not appear an unreasonable attempt in the proper season.

LANCASTER SOUND AND WELLINGTON CHANNEL ROUTE - Sir Edward Belcher's account of his arctic voyages 1850 to 1853 indicate that at least in some years passage thru Wellington and Queens Channel to the northwest tip of Grinnell Peninsula can be negotiated even by a small sailing vessel. Belcher arrived in Northumberland Sound in August 1852 where he established Winter Quarters Lat. 77°52'N, Long. 97°W. Later some of his party sailed a small boat northward to Exmouth Island and as far as the South East cape of Cornwall Island. This necessitated dragging the small boat over ice floes at times to get into open water. During this time late August and early September, water in open leads had started to freeze during periods of calm. Observations of this party indicated a greater extent of open water or wide leads for an indefinite distance into Norwegian Bay. With the use of a powerful ice-breaker this route could easily have been negotiated after the middle of August in the year 1852. It is more than likely that this same condition occurs each year. The route would follow a course ENE true from Exmouth Island thru Norwegian Bay to the mouth of Eureka Sound, thence Northward thru Eureka Sound to the vicinity of Schei Island where it is assumed the WX station will be located.

JONES SOUND AND CARDIGAN STRAIT ROUTE - A second possible water route would be to follow Jones Sound Westward to the vicinity of Kent Island where passage would be attempted northward either by Cardigan Strait or Hell Gate whichever appeared to be the best after aerial reconnaissance. After passage thru one of the foregoing channels additional aerial reconnaissance would indicate the correct route to follow to the mouth of Eureka Sound. Perhaps the route would bear slightly west to take advantage of the sheltering effect of Graham Island thence NNE into Eureka Sound. This latter route is considerably shorter than the one thru Wellington and Queens channels. On the other hand Jones Sound is usually choked tighter with ice than is Lancaster Sound.

In 1900 Jones Sound and Cardigan Strait were navigated by the Fram, a small sealing vessel. Encountering a great deal of ice thru Cardigan Strait, the Fram sailed as far north as the vicinity of Graham Island where heavy pack ice forced her to retreat, when again she passed thru Cardigan Strait with great difficulty. The Fram, however, reported much "water sky" northward into Norwegian Bay. There is no doubt that passage on into Eureka Sound could have been made by a powerful Ice-breaker especially with the assistance of a small reconnaissance plane. During Sverdrup's passage of Cardigan Strait in the second week of August 1900 there was very little obstruction from ice but the tidal streams were so strong that the vessel was steered with difficulty and was occasionally almost turned about. Further to the Northward beyond the strait the Fram entered very close pack ice and during the next few weeks was constantly

THIS PAGE IS UNCALSSIFIED

beset in the ice which was drifted by wind and tidal streams. In the middle of September the pack became suddenly open and the vessel was able to make rapid progress retreating to the southward where she again made passage thru Cardigan Strait.

U. S. WEATHER BUREAU

ARCTIC OPERATIONS PROJECT

EUREKA SOUND INSTALLATION

SPRING PROGRAM

Index of Instructions

II

THIS PAGE IS UNCALSSIFIED

F O R E W O R D

Instructions herewith have been prepared primarily for the information of United States personnel engaged in planning various aspects of the Eureka Sound Installation, and for the purpose of coordinating the general plans and schedules of participating agencies. Due to the imminence of the program several instructions have been completed prior to the conclusion of final arrangements with the Canadian Meteorological Service. Arrangements have now designated a Canadian to be Official-in-Charge of the Eureka Sound station, and this appointment is accepted with the full support and enthusiasm of the U. S. Weather Bureau. It is expected that plans as outlined will be agreeable to all concerned and will be followed as closely as practicable.

Sections may be found in these instructions which are not in complete conformity with the designation of Canadian control or which are questionable for other reasons. It is requested that advice as to such sections be forwarded promptly to the Arctic Operations Project, U. S. Weather Bureau, together with suggestions for correction.

It should be noted that Instructions hereafter are intended as a guide rather than an order. The success of the Eureka Sound mission depends on cooperation, timing, thoroughness of plans and mutual understanding by all persons involved. This can only be achieved through agreement on a preliminary program in advance. At the same time it is recognized that the program must be flexible, and that unforseen circumstances in the field may require changes of plan at any stage of the operations. Supervising personnel are therefore authorized to deviate from the Instructions as conditions dictate. All deviations of a substantial nature should be reported immediately to the next senior official in the field, and should be further covered by written report at earliest opportunity, for distribution to the Canadian Meteorological Service and the U. S. Weather Bureau.

EUREKA SOUND INSTALLATION

Spring Program

INSTRUCTIONS NO. 1 - Schedules

January through March -	Preparation of supplies for air shipment
March 1st :	Thule alerted to receive transients
March 1st to 15th :	Gasoline air shipped to Thule
March 15 :	First Eureka Sound Operations aircraft arrive Thule
March 20-25 :	Reconnaissance flight
March 20 - April 15:	Training at Thule Final preparations for air lift
March 25-30 :	Photo interpretation Final planning of flight operations
April 1st :	Initial Entry flight
April 1-7 :	Beginning of transport operations
April thru May 15 (or later):	Air Transport Advance Camp Construction Beginning weather observations radio schedules
May 15 (or later) :	Withdraw excess personnel from Eureka
May 20-30 :	Transients withdraw from Thule
June thru August :	Monthly airmail flights to Eureka from BW-8 thru to Thule

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

U. S. WEATHER BUREAU

EUREKA SOUND INSTALLATION

Spring Program

INSTRUCTIONS NO. 2 - OPERATIONS General

FLIGHT OPERATIONS - Flight Operations are considered in three phases. There will first be flown a RECONNAISSANCE FLIGHT for the purpose of selecting the most propitious location. This flight will not expect to land and will depend on visual observation and both high and low altitude photography. It will be flown in a long range C-54 aircraft, or equivalent, and will carry emergency supplies for the flight crew and two or more Weather Bureau observers.

The second stage involves INITIAL ENTRY onto the station location selected by reconnaissance. This will be accomplished by C-47 aircraft on skis, with C-54 aircraft escort or equivalent. It is to be hoped that if a satisfactory flight surface is found at the first location entered this may be selected as the station location. Only in case of serious objection to first location will alternate be attempted. Two Weather Bureau personnel and one Eskimo (if available) will be left at the advance station to prepare for air cargo operation.

The third phase of this activity involves AIR TRANSPORT. It is intended that an ice landing surface shall be prepared adequate for large cargo aircraft on wheels. This is practically mandatory because of the shortage of fuel at Thule for support of the less efficient C-47 operations. The use of large aircraft is less hazardous and will permit a larger cargo delivery. A portion of this delivery may be made by parachute.

AVIATION FUEL SUPPLY - Some 13,000 gallons of aviation gasoline are expected to be available in stocks at Thule for commencement of the Spring Program. This is not sufficient to move the required loads to Eureka Sound, and additional aviation gasoline must therefore be moved into Thule from BW-8 by air. This delivery of additional fuel is being undertaken by the U. S. Army Air Transport Command and is expected to amount to 50,000 gallons or more.

In view of the fact that the amounts of fuel, and the related air lift possibilities at Thule are uncertain it is planned to assemble the loads in three categories of priority.

ADVANCE CAMP LOAD - Minimum requirement of U. S. Weather Bureau for preliminary installation of a beach head, consisting of a 4 man camp with supplies for 5 months. Establishment of this camp depends on a firm commitment for additional delivery of supplies either through continuation of the SPRING AIR PROGRAM, or by activities of a SUMMER AIR PROGRAM. The Advance Camp will not be able to subsist through the 1947-48 winter without additional supply.

THIS PAGE IS UNCALSSIFIED

Advance Camp supplies estimated 40 tons (see Annex 4.1)

FIRST REINFORCEMENT - An increment of supply will be undertaken as further air lift into Eureka Sound becomes available. This increment will not be for the purpose of establishing the Advance Camp on an annual basis, but will still depend on a commitment for additional supply. The First Reinforcement will be used for delivery to Eureka Sound of equipment which cannot safely be dropped by parachute and which is required for the construction of the weather station. This equipment will include permanent housing, rasonde receptor and limited meteorological supplies, and miscellaneous supplies.

Since Rasonde equipment is to be taken in on the First Reinforcement, a 5th man is also to be sent in to assist in general camp activities and especially to operate rasonde equipment. Any additional air lift within 20 tons will be used for food and fuel. (See Annex 16.1)

FIRST REINFORCEMENT Load estimated 20 tons

SECOND REINFORCEMENT - If the full amount of 50,000 gallons of aviation gasoline is successfully delivered to Thule there should be air lift possibilities for a Second Reinforcement. The amount of fuel which may be available is questionable since consumption during previous operations cannot be estimated closely due to unknown variables such as warm-up time for aircraft, abortive flights, training and reconnaissance requirements etc. The Second Reinforcement will be used to augment the level of supplies at Eureka Sound in so far as practicable. Supplies will consist first of food and fuels. Thereafter additional food, fuel, meteorological supplies etc. will be transported to the limit of available air lift. It is estimated that to bring the supply level up to 400 days (as of May 30) will require Second Reinforcement air-lift of 40 tons. (See Annex 16.2)

ESTIMATED FUEL REQUIREMENTS - Rough estimates of fuel requirements are taken as follows:

ADVANCE CAMP LOAD 40 tons

Reconnaissance

2 flights based on BW-8	1,500 gals.

Initial Entry

2 flights - C-47 - 15 hrs. at 100 gal/hr	1,500 "

Air Transport

10 rd Trips - 8000 lbs. per load 60 hrs. at 200 gal/hr	12,000 "

Reserve

For Emergency Reserve	5,000 "	
Return of aircraft to BW-8	4,000 "	
Abortys, taxiing, heaters and misc.	5,000 "	∴ 29,000 gals.

THIS PAGE IS UNCALSSIFIED

		29,000 gals.
FIRST REINFORCEMENT LOAD 20 tons		
Air Transport		
5 rd trips - 8000 lbs. pay load 30 hrs. at 200 gal/hr.	6,000 gals.	
Reserve		
Aborts, taxiing, heaters etc.	3,000 "	
Future Air mail commitments	2,500 "	
		11,500 gals.
Total thru First Reinforcement		40,500 "
Originally available at Thule		13,000
Required from air delivery		27,500 "
SECOND REINFORCEMENT 40 tons		
Assume gas delivered to Thule		50,000
Remainder available		22,500
Air Transport		
60 hours at 200 gal/hr 10 rd trips at 4 tons - 40 tons	12,000 "	
Reserve		
Aborts, taxiing, heating etc.	5,000	
		17,000
Excess		5,500

Air-lift is here computed on a basis of 200 gals. per hour for 4 tons pay load. This may represent a C-54 with factor of safety on pay load (max. pay load 10,000 lbs.), or a C-82 with less speed but greater factor of safety on fuel consumption (average consumption 150 gals. per hour), or two C-47's at 4000 lbs. pay load each and 100 gals/hr consumption.

Air-lift operations will be conducted by the Troop Carrier Command, AAF, after the Air Transport Command withdraws from its operation of ferrying gasoline. Troop carrier will maintain rear echelon at BW-8 and advance echelon of some 35 personnel (ground and air crews) at Thule.

THIS PAGE IS UNCALSSIFIED

INSTRUCTIONS NO. 3 - ORGANIZATION

RESPONSIBILITY OF W. B. PERSONNEL - During the period of preparation, before the beginning of flight operations, the advance station official in charge will be responsible for preparation of all Eureka Sound supplies. The Thule official in charge has an over-all responsibility for the success of this mission and will provide such personnel, space, and other assistance as may be necessary. If the requirements of the advance base interfere with the function of the Thule station the allowable extent of such interference will be referred to the Central Office, Arctic Operations Project, for decision. It may be necessary to curtail certain Thule WX station activities during the period of air lift to Eureka Sound.

COORDINATION - After the beginning of field operations the advance station official in charge will be removed to Eureka Sound and will assume control of all surface activities at that location. A staff member from the Central Office, Arctic Operations Project, will be sent to Thule to assume charge of expediting and forwarding of supplies from Thule and will direct the Thule end of the Eureka Sound operation. The Thule official in charge will be responsible for the continued activities of the Thule Weather Station and for the housing and messing of transient personnel. The Thule Official in Charge will act in an advisory capacity with reference to the Eureka Sound operations.

ARMY RESPONSIBILITY - The senior officer present of the Army Air Forces will be responsible for all aspects of the air operations. He will designate air craft and air crews, prepare flight plans, control air ground communications, and manage the maintenance of the airstrip and aircraft at Thule. He will be responsible for loading aircraft for transport flight to Eureka Sound, for weight and balance, security of cargo, and method of delivery. On the Eureka Sound ice flight strip, Weather Bureau personnel will assist air crews in the maintenance and protection of their aircraft when required.

0020

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

EUREKA SOUND INSTALLATION

Spring Program

INSTRUCTIONS NO. 4 - Preparation of Supplies

APPLICATION - Instructions herewith apply only to supplies for the Spring Air Program, although several activities enumerated are also applicable to supplies for the Summer Air Program. If during the preparation of supplies items are uncrated or otherwise processed which are not included in the spring program this action will usually prove an asset later.

SCHEDULES - Preparation of supplies should be planned for final completion by April 1st. However, supplies for initial entry flight (see Instructions No. 9) must be ready on March 25, and the air borne tractor by same date. If final preparation is completed April 1st it is assumed that the first two or three aircraft loads will be in readiness prior to that date if required. Dates are specified as herewith because it is expected that personnel available at Thule for preparation of supplies will be transported to Eureka Sound on or about April 1st or will be wholly engaged on other aspects of the program thereafter.

PRIORITIES - Supplies will be assembled for air shipment according to the general schedule of priorities listed in Annexes Nos. 4.1, 16.1 and 16.3.

UNCRATING SUPPLIES - All supplies in heavy wooden crates will be uncrated for air shipment, except in cases where equipment may be subject to damage even with careful handling. The packing cases may be turned in at Thule in exchange for lumber to be transported to Eureka Sound. Boxes containing an assortment of small items should be opened in all cases where there is any doubt as to the exact contents. If time permits it will be desirable to fabricate special light boxes of plywood for holding assortments of small supplies instead of using heavy boxes designed for overseas shipment. Uncrating must be accomplished systematically to avoid the loss of small parts, identifying markings, etc.

REPACKING - Since all items in shipment must be satisfactory for exposure to wind and snow, it will be necessary to protect damagable items such as radios, etc., by wrapping them in cloth or paper. Items taken from boxes and which are unbreakable may be repacked in bags or other light containers.

MARKINGS - In all cases where items are re-assembled or re-packed and their identity is not perfectly obvious, they should then be re-marked with their classification number and a list of contents.

WEIGHING - All units for air transport should be weighed and the weight plainly marked on the packages to expedite the loading of air craft.

THIS PAGE IS UNCALSSIFIED

ASSEMBLY - After processing for air shipment all items should be assembled according to a pre-arranged plan. This plan should include a map showing the various locations used for storage of Eureka Sound supplies at Thule and a list of items in each storage. Outside storage will be used wherever practicable. In this case items will be arranged in the order of their priority for air shipment and divided into groups of approximately 4000 lbs., each. Items damagable by prolonged exposure will require storage under cover. The relative priority of the shipping arrangement must be clearly indicated on the assembly plan. It is intended that the assembly of supplies shall be so managed that the loading of aircraft can proceed rapidly and without errors.

AIR-LIFT - Annex 4.1 of these instructions contain a list of all items required for the Advance Camp for the Eureka Sound installation arranged in the order of priority for delivery and showing approximately the total number of loads of 4000 lbs. each for C-47.

ANNEX 4.1 AIRLIFT LOADING PRIORITY AND WEIGHTS

INITIAL ENTRY FLIGHT OR LOAD NO. 1

Emergency food, shelters, fuel, cooking equipment and temporary communication equipment for initial entry. This list for initial entry is identical to Annex 7.1 except in amount of detail and loading weights are shown here.

Item	Weight		Remarks
2 Weather Bureau men and 1 native	600	lbs.	
Tentage	90	"	2 tents small squad with pins, poles etc.
1 Watch dog	60	"	
Skis, 3 pairs	24	"	
Cooking stove and pipe	100	"	Small coal stove, tent size with 2 removable plates or Yukon stove
Personnel equipment 3 men	150	"	
1 Cooking outfit-small detachment	75	"	
Food, 45 fixed rations	250	"	Rations 3 men 15 days at 5 1/2 lbs. per ration
Tools	240	"	Shovels, picks, axes, ice chisels, tackle, crowbars, etc.
Gasoline heater	120	"	Herman, Nelson or smaller heater
SCR 694. com. equipment	95	"	Portable radio with hand generator
Gasoline driven Generator	75	"	14 volt - "little Joe" to go with SCR 694
Explosives	100	"	TNT - with primers, fuze, electric primers, electric detonator, etc.
Sledge (manhauling)	90	"	Manhauling sledge - Nansen type
Coleman stoves	16	"	4 single burner
Coal	400	"	4 - 100 lbs. sacks hard coal

EUREKA SOUND INSTALLATION

Spring Program

INSTRUCTIONS NO. 5 - Accommodation of Army Personnel at Thule -

LIVING QUARTERS - Living quarters will be available at Thule for approximately 40 military personnel. Thule station will be alerted by the 1st of March to be ready for transient military personnel to arrive. Being alerted means that housing will be ready for entry of Army personnel.

FOOD - There are sufficient staple and fixed rations at Thule to take care of feeding the Army personnel for 3 to 4 months or more. Food rations available at the station consist of canned goods of assorted varieties, canned meats, powdered eggs, powdered milk, flour, sugar, etc. There is not on hand sufficient fresh frozen or fresh vegetables to feed the Army complement. This latter will have to be flown in by Army Transport for their personnel, if desired.

PERSONNEL - The Weather Bureau does not have sufficient help or mess attendants on hand to accommodate the army complement. It will, therefore, be necessary for the army to provide at least 3 mess attendants to cook, wait on tables, clean dishes and perform general kitchen police duties for their own personnel.

MESSING - Military personnel will mess at a consolidated Weather Bureau mess, using mess trays and related equipment. The army mess attendants, (3) are recommended, will assist in serving mess and cleaning tables, dishes, etc., after each meal. The Weather Bureau and army cooks will prepare all meals served in the consolidated mess.

COOPERATION - Since WB personnel are chiefly responsible for WX observations, the army personnel will have to assume responsibility of maintaining facilities used by the army.

THIS PAGE IS UNCALSSIFIED

EUREKA SOUND INSTALLATION

Spring Program

INSTRUCTIONS NO. 6 - Training

TIME - Previous schedules indicate an alert for the Eureka Sound operation on March 15th at Thule. It is not believed, however, that substantial air cargo flight can be maintained until approximately the middle of April. The intervening period will be used for preparation and for training.

PREPARING ICE RUNWAY - It is intended that an ice runway shall be constructed on the harbor at Thule both for training purposes and for subsequent use of ski-equipped aircraft. This will provide practice in the use of the airborne tractor for snow removal and provide indoctrination for pilots for landing on ice surfaces.

EXERCISES - Exercises may be simulated for the selection of snow surfaces from the air and practice ski landings may be made on the harbor ice. Additional excercises may include

(a) aircraft landing
(b) cargo discharge, loading tractor of heavy equipment, etc.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

EUREKA SOUND INSTALLATION

Spring Program

INSTRUCTIONS NO. 7 - Preparation of Ski Runway at Thule

RESPONSIBILITY - The Official in Charge of the Thule Weather Station will be responsible for selecting a suitable strip on the bay ice, adjacent to Thule where a C-47 aeroplane may land and take off, either on wheels or skis.

WHEEL LANDING - It is planned that the first landing on the bay ice will be a C-47 on wheels. After the plane lands the wheels will be removed and skis installed in their place. This same plane will later be used on the flight of initial entry. (See Instructiens No. 7).

SKI LANDING AND TAKE-OFF - The strip selected must be 4500' or more in length so that a fully loaded C-47 may take off. The strip should be selected so that no obstructions will be found at either end, which present an aspect of more than 25 to 1 slope approaching the runway. The strip should also be oriented so that it is aligned as nearly as possible with the prevailing wind.

PREPARATION OF RUNWAY - The runway on the bay ice should be prepared in a similar manner to the ski and wheel runway maintained at Crystal No. 3, Baffin Island, during 1942 to 1944. All deep sastrugi should be removed or compacted either by use of shovels or with the tractor and blade. The edges of the selected strip should also be marked so that a plane might see from the air the area in which it is to land. Any residual ice humps or jagged bumps should be removed with an ice chisel so as not to endanger the under-carriage of a fast moving plane.

ICE LANDING TRAINING - After the flight crews and planes arrive at Thule and prior to the air transport activities, it is expected that pilots will practise a few landings on the bay ice landing strip both on wheels and skis to familiarize themselves with this type of operation, in accordance with available gasoline supplies.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

EUREKA SOUND INSTALLATION

Spring Program

INSTRUCTIONS NO. 6 - Reconnaissance

PURPOSE - To select the three most favorable advance station sites in Eureka Sound area preferably between latitudes 79'30' and 80°30'N. Examination will include high and low altitude observation and photography.

AIRCRAFT - C-54 or equivalent to be used, with tankage for at least 20 hours flight after leaving Thule. Aircraft need not be modified for photography except that provision should be made for oblique photographs by aerial cameras, both port and starboard.

FLIGHT PLAN - Reference is made to AAF Aero Charts - Sheets 7, 20, 21.

NORTHBOUND FLIGHT - Route will cross Ellesmere Coastal Mountains in vicinity of Makinson Inlet, proceed to southern reaches of Eureka Sound and follow the waterway northward thru Nansen Sound to latitude 81°30'N at air altitude of 5000' to 9000' Mission is to determine best general areas for closer examination and determine rough geography.

SOUTHBOUND FLIGHT - Return for low altitude examination of area selected during northbound flight in progressive order southward, particularly between 80°30'N to 79°30'N. Altitude of observation of particular areas to be not more than 1500' with possible occasional passes at 500' to examine details of snow surface on prospective landing areas. Altitude between areas of examination at discretion of pilot. The minimum flight route from Thule outward and return to Thule will be approximately 1400 miles but may be greater, depending upon amount of detailed reconnaissance required.

WEATHER - It will be mandatory that areas under low altitude observation shall be exposed to direct sunlight for definition of shadows. If sunlight fails flight must be re-run, unless obviously favorable conditions are convincing to all observers.

TIMING - Flight should be planned to reach the northern turning point at, or shortly before local noon.

PERSONNEL - Army to provide flight crew of personnel with previous arctic experience. There should be included in this crew the pilot (possibly as C-54 co-pilot) who is expected to make the initial C-47 ski landing on ice surface during flight of Initial Entry.

WEATHER BUREAU to provide minimum two observers (Arctic Operations Project, Central Office, representatives and Advance Station Official in Charge).

PHOTOGRAPHY - ON NORTHBOUND FLIGHT oblique photographs will be made, both sides, of all potential station locations

THIS PAGE IS UNCALSSIFIED

and of all prominent landmarks. Approximately every 10 to 15 minutes aircraft will be turned to permit overlapping obliques directly forward along Eureka Sound.

ON SOUTHBOUND FLIGHT for low altitude observation, a circle will be flown around each potential station site area at approximately 1500' and about 3 miles diameter for photographs taken from all angles. Very low altitude photographs will be taken along the lengths of potential ice flight strips. At least three alternate locations will be selected and thoroughly examined.

MARKERS - Three dozen black coal sacks containing a small quantity of sand and each will be carried, and thrown out at appropriate places to afford identifying markers in photographs, and possibly to assist in initial entry later on to show degree of change of snow surface. The plane will also carry twelve 1 lb. paper bags of lamp black to drop on selected surfaces. Paper bags should be equal in volume to 1 1/2 quarts and a 1 lb. stone should be included within the sack. About 6 smoke grenades should be available for dropping from plane at selected sites.

PHOTO DEVELOPMENT AND INTERPRETATION - Either reconnaissance airplane will return to BW-8 for processing film, or developing and printing facilities must be provided at Thule. Complete sets of prints will be made available at Thule for study by all personnel involved.

REQUIRED CHARACTERISTICS OF SELECTED STATION SITE - Reconnaissance will give special attention to observation and photographic record of the following elements.

1. Open exposure of favorable area to ensure representative weather observations, freedom from obstructions for tracking balloons, clear radio channels.
2. Character of adjacent ice landing surfaces.
3. Character of snow on landing surface.
4. Accessibility of the land from ice landing area, intervening ice etc.
5. Suitability of camp site, protection from high winds, snow accumulations etc.
6. Accessibility to fresh water in summer.
7. Possibility of flight strip on land either immediate available for skis or for future construction.

EMERGENCY EQUIPMENT - Equipment will be provided for Weather Bureau personnel, according to Annex No. 8.1 herewith.

THIS PAGE IS UNCALSSIFIED

EUREKA SOUND INSTALLATION

Spring Program

ANNEX NO. 8.1 - RECONNAISSANCE - List of equipment for 3 WB observers.

3 Sleeping bags (arctic type - double, down or equal.)
90 Rations (3 men - 30 days each)
3 Mountain tents
18 Empty coal bags with a few pounds of sand in each to be used to determine snow depth and texture by dropping from plane
12 Paper bags - containing 1 1/2 quarts of lamp black - to be dropped as desired, a 1 lb. stone should be in each bag to make fast enough to break on contact with surface
2 Five gallon cans of fuel
3 Snow shovels
3 Sets of personal gear and clothing. Part may be worn during flight, remainder to be carried in duffle bag of individual.

Following items suggested for each set of personal gear

1 Hunting knife
1 Arctic head gear
2 Pair sox - wool
1 Pair leather mittens and 2 pair extra wool liners
1 Pair Kersey lined trousers
1 Pair wool underwear, heavy winter
1 Pair ski boots
1 Sun glasses
1 Parka - (pile lined) heavy
1 Sweater
1 Windproof outer suit
1 Muffler
1 Pair winter Komiks (mukluks)
Tobacco, candy, etc., as required

1 Trail box - containing following equipment in addition to rations and other gear as above

1 Sewing Kit
1 Flashlight
8 Candles
2 Pocket compasses
12 Rawhide thongs
1 Cod line, hooks and jiggers
1 Minimum thermometer
Miscellaneous Equipment as required

In addition to the above it is assumed that the Army will provide, and it is recommended that the reconnaissance plane as well as all other

THIS PAGE IS UNCALSSIFIED

operating planes carry the following emergency equipment on each plane:

Sleeping bags and suitable arctic clothing for each crew member
30 Rations per crew member
Tentage for flight crew
1 Pair skis for each member of flight crew
2 Pair Snowshoes per plane
3 Mountain stoves (Coleman single burner) or equivalent
Fuel for stoves if aviation gasoline is not used
1 Cooking set for 5 men
1 Man hauling sled Nansen type
2 Hand Axes (small)
1 Hunting knife for each crew member
1 Snow saw
2 Snow knives
4 Snow shovels - long handle - 10" steel
1 Ice chisel
2 30 cal. rifles with 200 rounds ammunition
1 small 6 volt. gasoline driven battery charger
1 Gibson girl radio or equivalent
1 First Aid Kit
100 ft. 1/2" line - nylon mountain rope or equivalent
1 set of Charts of area

It is also assumed that army aircraft equipment will include, engine heaters (Van Prague or equivalent) engine heating hoods or covers, visual signals and flares, smoke grenades, mechanics tools, etc.

EUREKA SOUND INSTALLATION

Spring Program

INSTRUCTIONS NO. 9 - Initial Entry Flight

THULE - Thule station will have selected a suitable strip on the adjacent frozen bay where a C-47 may make a wheel landing and then install skis on the plane. The ski-equipped plane should be able to take off with a full load from selected sea ice so the strip must be about 4000' to 4500' minimum. In addition provision may be made for distributing snow and compacting it on the present land strip so that the ski-equipped plane may also operate from the land strip. The initial entry into the Eureka Sound station site for the physical survey will be accomplished by the use of a C-47 on skis.

PERSONNEL - The initial entry aircraft will carry the following personnel:

(1) An air crew carefully selected and with arctic experience.
(2) Three Weather Bureau personnel - The Official in Charge, a Radio Operator and a native experienced in building snow houses and traveling in the arctic if considered necessary, otherwise a Weather Bureau technician will be sent in place of native.

EQUIPMENT - Tallowed boards to keep skis from freezing down, emergency camp equipment for full complement of plane, etc. For list see Annex 9.1 - Equipment to be taken on Initial Entry for Weather Bureau personnel to be left at Advance Station.

MISSION - The mission of the initial entry flight is to physically examine and survey the most propitious site previously selected from aerial and photographic reconnaissance. The initial entry plane will land at the site selected as most suitable, considering all aspects. After landing a careful physical examination will be made of the site and THIS SITE will be used unless proved to be unsuitable. If found suitable no other sites will be examined. If site is not suitable plane will proceed to next most likely site. When site has been selected by physical inspection, the three Weather Bureau men will be left with all the emergency equipment available in the plane at that time and the plane will then proceed to Thule where a complete report will be made on the location and the suitability for future wheel landings or ski landings, whichever is considered the best. The Weather Bureau personnel left at the site will set up emergency camp and will be prepared as soon as possible to communicate with Thule station so that landing instructions and local weather conditions may be transmitted to the air-lift flight crews.

ESCORT PLANE - A C-54 or equivalent escort plane will accompany the flight of initial entry. The escort plane will be instructed not to land but only to observe the landing and take-off of the

THIS PAGE IS UNCALSSIFIED

initial entry plane. After observing the initial landing the escort plane will cruise overhead in the neighborhood until the survey of the potential station site has been completed. After the initial entry plane takes off for the homeward flight the escort plane will report same to Thule and when take off is completed, escort plane will then drop previously prepared emergency equipment by parachute at the spot indicated by the Weather Bureau personnel on the ground. This emergency equipment will include additional shelters in the form of cold weather tents, additional food, fuel, tools, etc., a complete list of which will be found in Annex 9.2. After dropping this equipment both planes will proceed to Thule station and air-lift to the Eureka Sound site will proceed as expeditiously as possible thereafter. The initial tonnage to be flown into Eureka Sound will be found in Annex 4.1 of operation plans. Equipment will be flown in accordance with the priority established in air-lift schedule.

ARMY EMEREGENCY EQUIPMENT - It is assumed that Army planes will carry necessary emergency equipment for plane crew and plane.

THIS PAGE IS UNCALSSIFIED

EUREKA SOUND INSTALLATION

Spring Program

ANNEX NO. 9.1 * These items are shown as load No. 1 in list of Annex No. 4.1

Equipment to be carried on flight of Initial Entry

3 Weather Bureau Personnel
1 Watch Dog
60 Dog food rations
45 Rations - 3 men 15 days
1 Small stove Yukon Universal or coal burning and stove pipe
2 Tents - squad with poles and pins or 2 special arctic tents
1 Set personal equipment per man - extra clothing, sleeping bags
1 Tarpaulin - 10' x 18'
1 Radio trans-receiver SCR - 694 or equal.
1 Portable gasoline generator for use with above radio
3 Flash lights and extra batteries
4 Coleman gasoline stoves single burner type, plus spare parts
400 lbs. coal, hard
1 Coleman 2 burner stove
50 gallons of gasoline
50 lbs. Kindling
1 Cooking outfit - small detachment
12 Candles - 1" x 12" or equivalent
2 Gasoline lanterns
5 Snow shovels
2 Ice chisels
1 Camp table
2 Crow bars suitable for removing rocks, digging holes, etc.
3 Picks
1 Explosive set (fuzes, primers - TNT) about 100 lbs.
2 Snow knives or machetes
2 Snow saws
1 Sewing Kit - assorted needles and thread - 4 yds. of tent patching cloth
100 ft. mountain rope - nylon
50 Runway marker flags - with double staffs as flags may be held flatwise toward wind
2 Cloth panels 3' x 10' each for marking contact point and direction for landing
3 Pair skis
2 Pair snow shoes
1 Man hauling sled
1 Set of charts of area
2 Pocket compasses
3 30 cal. rifles with 300 rounds of ammunition
1 22 cal. rifle with 1000 rounds of ammunition

Rations will include entire food required for Weather Bureau party for estimated period plus Matches, toilet paper, limited reading material, deck of cards, etc.

THIS PAGE IS UNCALSSIFIED

ANNEX NO. 9.2 - Emergency Equipment to be carried on Initial Entry - Escort Plane.

PURPOSE - The following list of equipment which will be carried on the C-54 or other plane which escorts the initial entry plane is to serve two purposes:

(1) In case of bad damage or fire on the initial entry plane which destroys. the supplies carried thereon, this emergency equipment would provide protection and subsistance until other material assistance becomes available.
(2) The emergency equipment will aid to the general level of supplies at the advance station and increase the usefulness of the escort plane.

PREPARATION - All equipment and supplies listed will be made up into kits or units of sizes suitable for dropping by parachute. After the initial entry plane successfully takes off from the selected station site, the escort plane will then parachute all equipment marked with an asterisk out at the site indicated, unmarked items will be returned to Thule.

EMERGENCY SUPPLIES

* 1 - Medical Kit - complete with medicines, bandages, instructions, splints, etc.
* 2 - Tents - small squad pyramidal type, similar to those carried on initial entry plane.
* 120 - Food rations (660 lbs. fixed rations)
* 60 - Dog. food rations - 100 lbs. if possible
* 1 - Coleman Stove - 2 burners
* 1 - Coleman Stove - 1 burner
1 - Cooking outfit - small detachment
* 30 - Gallons of fuel - suitable for Coleman stove
* 1 - Tarpaulin - about 12' x 18'
7 - Sleeping bags - (1 for each person on Initial Entry plane)
* 3 - Pair skis
* 2 - Pair snow shoes
* 12 - Rawhide thongs
* 1 - Set of charts
* 2 - Pocket compasses
* 50 - Wool blankets (Blankets will be used to line James huts)
* 3 - Sets of clothing
* 50 - Lbs. of explosives, including fuzes, primers, etc.
* 1 - Kit snow saw, snow knives, 200' rope
* 1 - Kit tools, hammers, bars, snow shovels
* 3 - Flashlights
* 12 - Candles
2 - Rifles - with 300 rds. ammunitions .30 cal. Springfield
* 2 - Snow Knives
* 2 - Snow Saws
* 1 - Sewing Kit
* 1 - Coil mountain rope - 100'
* 24 - Boxes matches - (safety) - toilet paper, cards, reading material etc.

THIS PAGE IS UNCALSSIFIED

1 - Radio Set - SCR-694 - TBX-8-SCR 619 or equal.
for emergency communications
1 - Set pyrotechnics- signaling equipment.

In case of an accident to the initial entry plane - the entire group of emergency equipment will be parachuted out to the distressed plane.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

EUREKA SOUND INSTALLATION

Spring Program

INSTRUCTIONS NO. 10 - Maintaining Eureka Sound Landing Facilities

SEA ICE RUNWAY - In order that air-lift to Eureka Sound may continue without interference during scheduled period it will be necessary to maintain the sea ice runway at Eureka Sound. After each hard blow or storm there is likely to be sastrugi built up over the surface. If the sastrugi are very high or rough they will have to be leveled so that a landing plane will not be subjected to any extra hazards. In the event that the runway cannot be prepared in time for any scheduled flights, Thule Station will be immediately notified by radio.

RUNWAY MARKERS - Runway markers and direction "T" may be blown down or covered with snow from time to time. Prior to plane landings all markers and direction "T" will be corrected if necessary so that they may be easily seen by a pilot.

PARKING PLANES - A parking space sufficient to accommodate one aircraft will be prepared to one side of the strip at the end nearest the prevailing wind. This will be the normal unloading area, and road to the camp site will lead from this location. Parking site will have sufficient room to turn the airplane with one wheel locked. It will be provided with tie-down facilities consisting of rope loops frozen into the ice and will have snow house or other shelter adjacent for storage of heaters etc.

CLEARING UNLOADING SITE - All cargo as unloaded will be hauled to the camp site or otherwise moved into the "clear" so that planes landing subsequently will not be subjected to extra hazards of hitting any cargo on the ice.

LANDING FACILITY REPORTS - Thule must be kept constantly informed of the runway conditions and any change occurring on runway that may be construed as a hazard will be immediately reported to Thule. Likewise weather reports of local or prognosticated Eureka Sound weather will be forwarded to Thule at least 3 times per day and additionally if required during air-lift period.

UNLOADING AT EUREKA SOUND - The Official in Charge at Eureka Sound will provide any necessary help for unloading since planes must return to Thule with greatest dispatch. It is obvious that any plane weathered in at Eureka Sound will require several man hours of time from personnel that ordinarily would be spent on camp construction.

SAFE LIMIT OF ICE DURATION - It is believed that the selected ice runway will be safe for landing until the last of May and possibly the middle of June. After the 15th of May tests should be made every few days to determine ice quality and rate of deterioration. Thule should be informed according to the results.

THIS PAGE IS UNCALSSIFIED

EUREKA SOUND INSTALLATION

Spring Program

INSTRUCTIONS NO. 12 - Communications

TEMP. COMMUNICATIONS PLAN

SCR-694 RADIO - During the construction period at the advance station the first communications will be with the SCR-694 set. This set is operated either by a hand cranked generator, a storage battery or a portable gasoline driven generator. The hand crank generator and portable gasoline generator will be available for use at the advance camp. The SCR-694 will be used until a small James Hut 16'x16' is completed. Communication is limited to frequencies between 3.8 and 6.5 megacycles with this equipment.

AN/VRC-1 RADIO - As soon as a suitable shelter is available (16'x16' James Hut) the AN/VRC-1 will be set up and used for communications since it is much more powerful, has a much wider frequency range and can serve as a Radio Beacon. There will be a 1.5 kw. -12 volt generator to operate this communication equipment during the emergency period. Tuning coils are to be supplied which permit tuning range from 200 Kc. to 12,500 kc. It may be pointed out that the TM for this set states distance range is approximately 60 miles (page 2), but its actual range under fixed installation and with an efficient antenna is much greater. As soon as conditions permit the AN/VRC-1 should be placed in a temporary operating condition. This means that it should be used with or without permanent type antenna or without being placed in its permanent location.

RADIO BEACON - Call Sign "E8"

The AN/VRC-1 is to be used as a Radio Beacon when required by Air Transport planes coming into Eureka Sound. Its frequency range permits this use and a keying device will be procured if possible for automatic keying of the transmitter on Beacon frequencies. If the keyer is not obtainable the transmitter should be prepared for Type CW emission and the circuit closed for continuous operation. The dynamotor operating this equipment is not rated for continuous operation so the transmitter should be stopped occasionally. The frequency to be used by the Beacon will be assigned and borrowed from the Army and is to be used only during the Air-lift unless additional instructions are forwarded concerning its use.

SPECIAL NOTE - The BC-191 transmitter (part of AN/VRC-1 set) can be keyed continuously only on CW type emission. This should be done not more than 2 to 4 hours at one time. Before keying again it should be left in non-operating condition for a few minutes - at least 5 minutes but more if conditions permit.

DO NOT - under any circumstance continuously Key the BC-191 transmitter on modulated CW or Voice Modulation as certain parts will be burned out from excessive loads.

THIS PAGE IS UNCALSSIFIED

EMERGENCIES - The advance station will ordinarily send all communications out during scheduled periods, but may in emergency transmit at any time.

REVIEW - Frequencies and scheduled periods are subject to review and to be changed if necessary by chief of radio section at Thule. Schedules will be selected, however, that are convenient for the advance station and be so arranged that minimum interference with construction work will be encountered since it will require 1 to 2 men to operate communication equipment.

COMMUNICATIONS - Messages will deal exclusively with the following:

Weather information for Air Transport planes,
Landing instructions for transport planes,
Requests from advance station for certain required material and emergency use.

PERMANENT COMMUNICATION SYSTEM - The temporary communication system will be maintained and operated until permanent equipment is installed and in use. At that time Eureka Sound will start regularly scheduled transmissions of weather data at periods to be assigned by Thule.

THIS PAGE IS UNCALSSIFIED

ANNEX 12.1 - Radio Schedules (Temporary Communications Plan)

THULE - Thule will stand continuous guard on the advance station during the period that temporary communications are in effect. Frequencies to be guarded by Thule will be:

(a) 5597.5 day and night
(b) 6355.0 day and night
(c) Other frequencies as assigned.

Eureka Sound can transmit only on frequencies between 3.8 and 6.5 megacycles until the AN/VRC-1 Radio communication equipment is installed. It is desirable that frequencies be selected that give a clear channel, however, they must be authorized for use. When the AN/VRC-1 is installed, even temporarily, Eureka Sound can transmit on any assigned frequency between 200 and 12,500 kcs.

EUREKA SOUND - Eureka Sound will guard Thule for incoming messages only during scheduled periods:

(a) 11:00 to 12:00 Z
(b) 17:00 to 18:00 Z
(c) 23:00 to 24:00 Z

All times are G.C.T.

Frequencies for Thule Transmission will be assigned at Thule and entered on this sheet

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

INSTRUCTIONS NO 13 - Emergencies

SEARCH AND RESCUE - The AAF will provide a search and rescue unit which will maintain rear echelon at BW-8. Under ordinary circumstances there will be no necessity of having any of the unit at Thule since it will require extra facilities for the personnel involved. Upon requirement the search and rescue unit will move into Thule which would then become the base of operations while search is conducted.

RESPONSIBILITY - The Army will have entire responsibility for search and rescue operations. It is suggested, however, that plans for search be carefully coordinated with Weather Bureau personnel in Thule at that time, since they may have many valuable suggestions and previous experience which should be extremely useful in successful search operations.

EUREKA SOUND CAMP EMERGENCIES - Certain emergencies may arise at the station such as bad accidents, fires, plane and/or storm damage of a serious nature. It is difficult to say definitely what should be done in each case. In general in all such cases follow the course that the best logic dictates. There are however, certain eventualities that would indicate a specific course to follow.

(1) In case of an accident to a person which is somewhat serious and renders his usefulness negative at the camp site during construction, he should be returned to Thule on the first plane thereafter where he will remain until he is able to perform the necessary duties again or until replaced.

(2) In case of damage to plane which grounds it temporarily Thule should be notified immediately of circumstances
(3) In case of supplies or buildings being badly damaged by fire or storm notify Thule immediately with recommendations for replacement or other action.
(4) In the event of sudden bad weather while a plane is on its way or ready to start for Eureka Sound notify Thule immediately and flights will be recalled or stopped by Thule.
(5) If unflyable weather appears to be descending on Eureka Sound or if trend is toward bad weather--notify Thule as soon as possible.
(6) In any case of emergency where a decision cannot be made at Eureka Sound notify Thule immediately.

USE OF RADIO - Except at scheduled times (see Instructions No. 12) radio will be used only in case of emergencies of the character listed above. Excessive use of the radio renders it less effective and slows down camp construction.

LOSS OF RADIO - In the event that radio equipment at Eureka Sound fails to function, provision should be made to use visual signals for convenience of investigating aircraft etc.

LANDING - If landing strip is suitable for landing the "T" made of dark cloth panels will be displayed at the contact end of the runway.

THIS PAGE IS UNCALSSIFIED

LANDING STRIP UNSAFE - The direction "T" will not be displayed if the landing strip is not considered safe for landing.

DROP KITS - Drop Kits will be prepared or ready at Thule for quick assembly to be flown over and dropped to personnel on ground in case of necessity. The drop kits will contain generally food, fuel, clothing etc. which can be used in emergencies as required.

EUREKA SOUND WEATHER FORECAST - It is directed that all weather reported from Eureka Sound for use of aircraft be conservative. It will be more economical to turn a loaded plane back to Thule than to let it continue in bad visibility conditions, low ceilings or bad drift. When there is any doubt concerning suitability of weather for flying - render all reports on the conservative side.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

INSTRUCTIONS NO. 14 - Personnel and division of responsibilities

STATION PERSONNEL - Present plans require only 4 personnel of the advance station one half of these may be Canadians. The personnel will be

(1) Official in Charge
(2) Radio Operator - Technician
(3) Weather Observer
(4) Mechanic

DIVISION OF RESPONSIBILITIES - THE OFFICIAL IN CHARGE will have overall responsibility for operating the station successfully. He will likewise share in Weather observing duties, radio operation and related matters.

THE RADIO OPERATOR - TECHNICIAN will have charge of radio equipment and its operation.

THE WEATHER OBSERVER will be responsible for general quality and success of WX observations and maintaining station records in accordance with Weather Bureau policies.

THE MECHANIC will assist in necessary radio operations; help maintain records and maintain mechanical equipment at Thule Station.

In addition to regular assignment responsibilities, all individuals will share alike in preparing meals, cleaning the mess, galley, dishes and building, maintaining buildings, heating, providing water, drainage of living area and all related duties in connection with station operation.

It is recommended that duties be divided and that each individual take one week in turn for preparing meals and maintaining the mess facilities. This would be followed by one week of charge of quarters duties such as sweeping building, serving heating stoves with fuel oil, bringing in coal etc. All assignments except primary station activities should be rotated each week so that each individual will share equally in camp maintenance duties.

It is possible that a fifth man will be sent to the advance station. This person will be generally a weather observer and specialist in Radiosonde operations, hydrogen gas generation, pibal balloon observation etc.

THIS PAGE IS UNCALSSIFIED

INSTRUCTIONS NO. 15 - Camp Construction

Housing	Annex	15.1
Fuel	"	15.2
Food	"	15.3
Electric Power	"	15.4
Transmitting Antennas	"	15.5
Caches	"	15.6

INITIAL CAMP - After initial entry flight has landed and selected an advance site by examination, the Weather Bureau personnel left at the site will establish a temporary camp consisting of tent shelters and snow houses. These shelters will be used until more equipment and housing arrives from Thule.

COMMUNICATIONS - The first priority for Weather Bureau personnel at the advance station after setting up a temporary camp is to establish radio communication with Thule. Radio equipment will be installed in one of the tent shelters and Thule will then be contacted. Weather and runway information will be transmitted for all subsequent flights to the advance station. For details, shcedules, equipment etc. see Instructions No. 11 - Communications.

PREPARATION FOR RUNWAY - After communications are established with Thule, a runway suitable for wheeled aircraft will be prepared. It is assumed that the station site will have been selected partly because of good landing on nearby bay ice. Consequently the sea ice may require but little preparation beyond that found in its natural state. It is likely, however, that some sastrugi and residual ice bumps will have to be moved or smoothed out. This will be accomplished with shovels, ice chisels and mattocks.

RUNWAY MARKERS - A length of ice at least 4000 ft. long and 150 feet wide must be prepared. The sides of the runway strip are to be marked with "H" frame flags - so that the broad side of the flag will be presented to the airplane as it runs down the length of the strip. Flags, description and quantities are found in Annex 9.1. In addition two cloth panels are to be laid out in the form of a "T" at the contact point of the strip. The top of the "T" will be pointed down the runway in the direction the plane is to land.

THIS PAGE IS UNCALSSIFIED

ANNEX 15.1 - Housing

PROBLEMS - Since the season will be early for selecting a suitable building foundation site it is intended that the James Houses be erected with the possibility in mind that they may have to be moved after the summer thaw is well advanced. It will be extremely difficult to select a foundation site covered by snow and hard frozen, that will meet the requirements for sturdy buildings. A Quonset hut is being furnished in the 20 tons supply allotment. This building is provided as a permanent shelter for the winter 1947 and 1948 as well as subsequent times. The James huts are intended to be used as living quarters only thru the summer.

It is expected that installation of electrical circuits, radio equipment, storage Batteries etc. will be of a temporary nature pending the erection of the permanent Quonset hut. When the Quonset hut is completed all equipment can then be placed in permanent position. For ease in construction it is best to erect the Quonset hut after the summer thaw is well advanced so suitable foundation can be placed and so that bad drainage water or swampy ground can be avoided. It is desirable, however, that the Quonset be erected adjacent to James huts so that they will not have to be moved. All James huts will still be used for storage and other uses. It is planned that the Quonset hut will be modified with at least one partition, extra windows, linoleum covering for floors etc. This material is being supplied in addition to the basic Quonset hut.

BUILDING ARRANGEMENTS - In the initial 40 tons of supplies there are three James Shelter units, 2 of which are 16'x24' feet in floor dimensions and a third, 16' x 16'. It is recommended that the smaller unit be constructed first since it will provide a very good type of shelter until more permanent arrangements are available. It will be fairly convenient to prepare food and possibly camp in the small 16' x 16' unit for short periods if there are not more than 6 or 8 persons at Eureka Sound at the time. The final use of the 16' x 16' James Shelter is to be an inflation shelter for inflating radiosonde and pilot balloons and storing calcium hydride and related equipment.

The second building to be erected should be one 16' x 24' unit which will house one galley, provide living quarters for the permanent station personnel and also serve as an office space for weather observing activities. Projected plans call for one small galley cookstove in this building which theoretically is to consume 50 lbs. of coal a day both for cooking and melting snow for culinary water supply. Supply provision provides only 50 lbs. coal per day which should be the average consumption over winter and summer. If coal is consumed in excess of this quantity it will have to be carefully rationed so that over a period of a given time the average coal consumption will not exceed the 50 lbs. allotment. This means that the stove cannot be kept burning 24 hours per day all the time. There will also be one oil heater in this building.

The third James Shelter which is also 16' x 24' is intended to house the Kohler generators, the storage battery bank, the workshop and for limited storage of certain types of supplies that must be kept under shelter. A second Evans oil burning space heater is provided for this building. However, it is not intended and fuel oil is not available for

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

burning this heater more than possibly 2 to 4 hours in any given day. Attention is invited to the fuel oil allowance of an average of 8 gallons per day for all uses whatsoever, both winter and summer. Since summer use of the fuel oil will possibly not be more than 4 gallons per day it should be possible to use the second oil burner in the generating building part-time. The heater in the generating building should be used at times other than generating periods since an appreciable amount of heating effect will be produced by the generators while operating. It is perhaps best to plan on using the stove in the generator building during periods when it is necessary to work in the workship or prior to starting the generators. In any event, all fuel oil must be carefully conserved and rationed.

In the second supply allotment of 20 tons a fourth James Shelter unit is being included. This shelter will be 16' x 16' and it is planned to be used primarily as a storage building to relieve the congestion of supplies and equipment stored in other James units. The final use of this building, however, is largely left to the discretion of the Official in Charge since circumstances in the Field may require changes from this general plan.

The buildings should be safely separated from each other so that a fire in one will not be carried by wind or convectional heat to a second building. On the other hand those buildings which are to be lighted electrically or to have electrical circuits in them must be kept fairly close together to avoid loss of electric power over lengthy circuits.

SELECTING SITE - The James houses will be erected on the most suitable area located and should meet the following conditions in addition to those described in Instructions No. 6, Reconnaissance.

1. Should be level or nearly so in order that foundations may be placed with a minimum of disturbing the hard frozen surface.
2. Soil structure should be gravelly so that good drainage prevails near and around the building.
3. Should be conveniently located with respect to fresh water - either in form of ice, snow, or fresh water in season.
4. Should be not too distant from plane unloading spot.

FOUNDATIONS - Foundations for James huts will be 4" x 4" pieces laid out in 5 parallel rows the length of the building and spaced 4' apart. The sleepers will be leveled by cutting away surface material where necessary and by blocking up at other points. The 4"x4" sleepers should have contact with the surface at least every 4' along its length. The floor will be placed directly on 2"x4" cross members which are laid across the sleepers. It is easily seen from the foregoing that a great deal of time and labor will be saved by selecting a building spot on gravel that is nearly level. An instrument for leveling foundations must be available at the advance station.

SUPER STRUCTURE - When the foundation is complete the building will then be erected in finished form. The 16' x 16' inflation hut should be erected in complete form first since several points may be learned from its erection and will serve as an excellent emergency shelter.

THIS PAGE IS UNCALSSIFIED

The finished building will provide a better type shelter for temporary quarters then the tents. The James houses arches should be stengthened by placing vertical supports from the floor to the arch at approximately 4' from the wall. This will help support snow loads and strengthen against high winds. The supports in turn may also be used to hold shelves etc.

MODIFICATIONS - It is suggested that extra windows be placed in James huts if required. Plexiglass wire screen is being furnished for this purpose. Window openings can be cut in the hut wall then a framed window with air space formed by two pieces of plexiglass screen can be installed and secured to wall material.

The interior of living quarters space may be lined with insulation board or 1/4" plywood which will make it much more comforable. Material is being furnished for this purpose. It is suggested that this problem be tried out at Thule where James huts are already erected so that any necessary pre-cutting may be accomplished ahead of time. It is also suggested that any bulkhead or partitions required, together with doors be pre-cut and fabricated at Thule as far as possible.

It may also be desirable to line the ends of the living quarter building with 1/4" plywood to improve the insulation and utility of the huts. If 1/4" plywood is not available cellutex board may be tried or use blanket.

SNOW WALLS - When buildings are completed it will be desirable to erect walls out of drift snow blocks around the buildings. The snow wall will serve as a protection against high wind and will help insulate the building from severe cold. The walls should be erected as high as the wall curvature permits and an air space of 6" x 8" should be left between building and snow wall. The snow wall can be erected completely to the top of hut at each end. The snow wall will be erected only about 5' high along sides of building because of the arched sides of the hut. The top of the snow wall should be brought into contact with the James hut to prevent drift from filling the air space.

Cross Section of Hut

Snow blocks

Air space

THIS PAGE IS UNCALSSIFIED

ANNEX 15.2 - Fuel

COAL - Hard coal is to be used for the cook stove. Estimates require 50 lbs. per day for 150 days or 7500 lbs., 3 3/4 tons. (initial 40 tons of supplies)

FUEL OIL will be used to operate 2 heating units, one in the operations space and the second in the transmitter - Generator building. The heater in the operations building will be operated about 24 hours per day except during months of June, July and August when operation will probably not be continuous. The second heater will be operated only when heat is required in the generator building to keep equipment warm and make engines easy to start and when it is necessary to work in building. It is not expected that the heater in the generator building will be used more than 4 hours per day average. Average fuel consumption per heating unit per day = 5.6 gallons during the period indicated. This will require a total of 1750 gallons for 2 heaters, a gross weight of 6 4/5 tons. This oil must be carefully conserved and rationed.

Heating Fuel Oil

Month	Days	Gals/day/unit	Total
April	- 30 days	9 gals/day/ unit	270 gals.
May	- 31 "	8 " " "	248 "
June	- 30 "	6 " " "	180 "
July	- 31 "	3 " " "	93 "
August	- 31 "	2 " " "	62 "
			853 x 2 = 1706 gals.

1750 gals. or 6 4/5 tons

GASOLINE - is to be used for generators, tractor, some heating, portable generator, Coleman stoves and gasoline lights.

The tractor is to be operated mainly for hauling supplies from plane unloading point to camp site, for maintaining runway on ice and for hauling ice or snow blocks for snow melter. During period of 150 days it is estimated that the tractor will operate as follows:

Month	Hrs/day		Hours
April	- 5 hrs/day	x 30 =	150 hours
May	- 5 " "	x 30 =	150 "
June	- 3 " "	x 30 =	90 "
July	- 1 " "	x 30 =	30 "
August	- 2 " "	x 30 =	60 "
			480 hrs. 2 1/2 gals. per hr. = 1200 gals.

1200 gals. at 7 lbs/gal. = 4 1/4 tons

KOHLER GENERATORS - Generators will be operated approximately 10 hours per day during 4 transmission periods. Generators use about 8 gals/24 hours, $\frac{10 \times 8}{24}$ = 3 1/3 gals. x 150 days - 500 gals. = 1 3/4 tons.

GASOLINE LIGHTS, HEATERS, COLEMAN STOVES ETC. - 250 gals. = 7/8 ton
All gasoline and other fuels must be conserved carefully and rationed.

THIS PAGE IS UNCALSSIFIED

ANNEX 15.3 - Food

FOOD will consist largely of staple rations such as canned vegetables, canned and dried fruits, canned meats, powdered milk, cereals, etc. in sufficient quantities to insure well balanced meals. The ration is based on 5 1/2 lbs. of food per man per day which is in excess of consumption at Thule and other similar arctic stations.

SUPPLIES - Food is being furnished for station complement of 4 men for 150 days plus 308 reserve rations for air crews, construction help etc. If food is being used in excess of 5 1/2 lbs. per day per man it will have to be rationed. If additional food supplies are not delivered during the Spring Program new food supply will be flown in August either by flying boats or by parachute drop.

COOKING - Cooking arrangements will be left up to Official in Charge at station. It is suggested, however, after station has been completed that each person in turn take a weeks duty as cook and KP to maintain the best morale. 308 fixed rations, type 10 in 1, K and E are being furnished for the construction crew and air crews if weathered in. It is suggested those rations be used to feed all hands during the emergency period since it will require a minimu of preparation, heating etc. The Official in Charge at Eureka Sound should assign one man to prepare food and maintain facilities. This person will assist in camp constructions work while not engaged in preparing food etc. It is suggested that this duty be rotated at short intervals to obtain best results.

RESERVE RATIONS provided for use during the construction period should be consumed first. These rations are 10 in 1, type K, Type E and D. This series of fixed rations are more easily prepared and since the permanent camp ration offers a greater variety of foods, the latter should be saved until the construction crew have completed the building project.

THIS PAGE IS UNCALSSIFIED

ANNEX 15.4 - Electric Power

POWER SOURCE - Two Kohler 32 V - 2 kw generators are being furnished. These furnish power for lighting and battery charging. A 32 volt wind charger and storage battery system is also being furnished for auxiliary power. In addition one small portable 115 Volt AC generator is being furnished which may be used to operate radio receiver - R - 100 - which may be provided for morale purposes. The R - 100 Receiver may also be operated from batteries.

OPERATION - The main generators will be used only during transmission periods except when it is necessary to bring charges of batteries up in emergencies. The generators will not be used in excess of 10 hours per day average - providing the consumption of gasoline is 3 1/3 gallons per day or less. It is planned to have 4 transmission periods per day of not to exceed 2 1/2 hours each.

HOUSE LIGHTING - Electric lights may be used in building during generating periods. Gasoline lights will be used at other times when required. It is mandatory that battery charges be maintained at correct voltage - accordingly lights may not be used from batteries when charges are below normal - except during generating periods.

WIRING - Electric wiring will be so arranged as to obtain the maximum efficiency from eletric circuits. Long lead-in circuits will be avoided, accordingly generators will be placed as close as possible to main power consuming units.

Since all communication equipment operates from 12 Volts D.C., power for operation must be obtained from storage batteries by tapping 6 cells. In order to equally distribute the load on batteries this must be repeated each day using a different set of 6 cells. An attempt is being made to secure a 32 Volt to 12 V converter so that power may be taken from generator or batteries simultaneously without changing cell units each day.

THIS PAGE IS UNCALSSIFIED

ANNEX 15.5 - Transmitting Antennas

TRANSMITTING ANTENNA towers will be erected as near as convenient to the transmitting building.

TOWERS - Towers are to be prefabricated of glued plywood and may be built to approximately 45' high providing sufficient guy wires are used. Towers should be equipped with sheaves and halyard so antennas may be raised or lowered at will. With suitable relays the transmitter antennas may also be used for receiving.

DEAD MEN- for supporting guy wires will be difficult to bury in hard frozen ground. Recommend small pioneer holes be driven with picks and crowbars then blasted - repeating process until sufficient depth is attained to receive dead men. Finally water should be poured over the dead men and allowed to freeze solid before using.

During the summer thaw the dead men may loosen up. If such is the case they should be set in deeper holes and heavy rocks piled over them.

THIS PAGE IS UNCALSSIFIED

ANNEX 15.6 - Outside Caches

Supplies will be placed under cover, preferably within buildings. Those supplies left outside will be stored in neat secure caches with a record kept of contents of each cache so that articles may be found when required with minimum search.

FUELS - Combustible fuels are to be placed outside at some distance from buildings in small units of not to exceed 12 barrels of gas or fuel oil per unit. Each unit is to be separated sufficiently to safeguard from fire of either buildings or other fuel units. The coal is to be placed in a convenient site where it will not be frozen down by thaw water etc.

THIS PAGE IS UNCALSSIFIED

INSTRUCTIONS NO. 16 - Additional Supply Allotments

PURPOSE - Since the initial 40 tons of supplies only provide Basic Weather Station Equipment plus food or fuel for 150 days, it is essential that additional supplies and equipment be moved in as conditions permit.

BASIS OF SUPPLY - The additional 20 tons listed on Annex 16.1 herewith will be possible only if extra gasoline arrives in Thule prior to time of Eureka Sound Station instllation. It is planned that extra gasoline will arrive in Thule and if so the 20 tons listed in Annex No. 16.1 will be carried over. Furthermore if gasoline, planes and weather permit, additional allotment of supplies beyond the initial 40 and 20 tons will be sent over. This will consist principally of food, fuel and balloon inflation equipment.

THIS PAGE IS UNCALSSIFIED

ANNEX 16.1 - First Reinforcement

SUPPLIES TO BE TAKEN INTO EUREKA SOUND IN ADDITION

TO INITIAL 40 TONS - IF EXTRA GASOLINE IS FLOWN TO THULE

Items are given in order of priority

HOUSING

1 Quonset Northern Hut with modifications		15000 lbs.

RADIO-SONDE EQUIPMENT

100 Radiosonde transmitters	250	
1 Radiosonde receptor	1200	
1 Home-lite generator w/voltage regulator	250	
	1700	1700 "

HYDROGEN OR HELIUM

48 Cylinders	6000 "

FOOD

444 Rations at 5.5 lbs/ration	2440 "

FUEL

Coal	84 days at 50 lbs. per day	4200 "
Fuel Oil	for 1 Evans heater at 8 gals. per day 84 days 672 gallons	5400 "
Gasoline	Kohler Generators 3 1/3 gals. per day 84 days 294 gallons	2064 "
Tractor	1 hr/day at 2 1/2 gals/hr - 2 1/2 x 84 days 210 gallons	1470 "

EUREKA SOUND INSTALLATION

SPRING PROGRAM

INSTRUCTIONS NO. 3 - ORGANIZATION AND RESPONSIBILITIES

There will be five groups in the field involved in the Eureka Sound installation. These may be designated as follows:

1. Eureka Sound Complement, under direction of the Eureka Sound Official in Charge - Canadian.

2. United States field staff for Eureka Sound, under direction of the Eureka Sound Executive Officer - United States.

3. U. S. Army Air Force Air Lift detachment, under direction of the U. S. Army Task Force Commander.

4. Thule Station, under direction of the Thule Official in Charge - United States.

5. U. S. Weather Bureau Washington representative, under direction of the senior official.

The duties and responsibilities of personnel may be outlined as follows:

COORDINATION - Eureka Sound Official in Charge - Canadian - will have general responsibility for the successful establishment of the Eureka Sound Station on Canadian soil, and for the continued operation of the station. It is expected that he will participate in reconnaissance for determination of the location of the Eureka Sound station and shall participate in the selection, and approve, the final site. It is expected that he will participate in the initial entry at least in a supervisory capacity and will proceed to the Eureka Sound station at an early date consistent with the completion of all supporting arrangements at Thule, Greenland. While he is at Thule he will have technical responsibility for the Eureka Sound program, except that the U. S. Army Task Force Commander shall retain at all times full control of air transport operations as noted below. While at Thule the Eureka Sound Official in Charge will be under the administrative jurisdiction of the Thule Official in Charge and he will be responsible for the conduct of other Canadians present at Thule, in conformity with the administration of the Thule station. He will have the privilege of the use of the Thule radio for messages, addressed directly to the Controller of the Canadian Meteorological Service, bearing both his signature and the signature of the Thule Official in Charge.

Upon proceeding to the Eureka Sound location he will assume both administrative and technical responsibility for the construction

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

of the station, having jurisdiction over all station personnel. In general he shall exercise jurisdiction over U. S. personnel through his Executive Officer. He may transmit messages via the Eureka Sound radio over his own signature, for relay through the Thule radio, addressed to the Controller of the Canadian Meteorological Service.

At Eureka Sound he will provide assistance to the United States Army Air Forces in their performance of the air transport mission and he will provide communications in support of air craft movements to the best of his ability, and according to the desires of the U. S. Army Task Force Commander.

Having due regard for his over-all responsibility for the security of personnel and for the success of the operation he will follow predetermined plans and instructions in so far as practicable and will advise the Controller of the Canadian Meteorological Service of any substantial devision from the pre-determined plan. In emergencies he shall have authority to make such deviations as may be necessary.

EUREKA SOUND EXECUTIVE OFFICER - U. S. - will be in charge of preparation of supplies for the Eureka Sound program prior to the arrival of the Eureka Sound Official in Charge, and thereafter will be subordinate to the Official in Charge. It is expected that he will proceed to the Eureka Sound location at the earliest opportunity where he may represent the Official in Charge, during any absence of the latter. He will be responsible for the interest of the U. S. Weather Bureau at Eureka Sound, including the maintenance of cooperation between American and Canadian personnel, and the general accountability for supplies and equipment provided by the United States. In communicating with higher authority he shall act through the Official in Charge.

The Executive Officer shall at all times have the privilege of communicating with the U. S. Weather Bureau either by radio or by letter. Radio messages of this nature should bear the signatures of both the Executive Officer and the Official in Charge and should be addressed to the Controller of the Canadian Meteorological Service for the advice of the U. S. Weather Bureau. All letters of an official nature from the Executive Officer to the U. S. Weather Bureau should bear an endorsement by the Official in Charge.

With reference to personnel it is the intention that both the Canadian and American members of the Eureka Sound staff shall act as a single unit with direct channels of responsibility from the Official in Charge. Under exceptional circumstances, or as conditions warrant, the Executive Officer, acting as the Senior American present may serve as liaison between the Canadian and American complements.

U. S. ARMY - TASK FORCE COMMANDER - will be responsible for all aspects of the air operations. He will designate air craft and air crews, prepare flight plans,

THIS PAGE IS UNCALSSIFIED

direct air ground communications, and manage the maintenance of the airstrip and aircraft at Thule. With the assistance of the Thule staff, he will be responsible for loading aircraft for transport flight at Eureka Sound, for weight and balance, security of cargo, and method of delivery. On the Eureka Sound ice flight strip, advance station personnel will assist air crews in the maintenance and protection of their aircraft when required.

THULE OFFICIAL IN CHARGE - will be responsible at Thule for the support of the Eureka Sound program including the housing and messing of transient personnel, station administration, and communications both as required in the administration of the Eureka Sound program and for the support of air operations. He will provide personnel for such assistance on the Eureka Sound program as may be possible without jeopardy to the operation of his own station. If the requirements of the Eureka Sound program necessitate the employment of personnel or supplies from Thule which may interfere with the functions of the Thule station he may accept the responsibility for decision or he may refer the matter to the Arctic Section, U. S. Weather Bureau for approval. With due regard for the interests of the Danish Government in the operations of the Thule station he is authorized to reduce the technical functions of his station in favor of the Eureka Sound program on a temporary basis during the spring operation.

He will act in an advisory capacity with reference to the technical details of the Eureka Sound program.

WASHINGTON REPRESENTATIVE, U. S. WEATHER BUREAU - will serve primarily in an observing and in an advisory capacity. He will act at all times to insure maximum cooperation between the Canadian and American elements and between civilian and military participants. He may accept a definite responsibility for part of the American participation at Thule, such as the forwarding from Thule of supplies according to schedule. He will have authority to approve changes of basic plan involving the U. S. Weather Bureau participation. He will prepare a full report on the operation including recommendations as to procedures for this type of activity.

CENTRAL OFFICE PROCEDURES

In addition to the coordination between groups engaged in the field it is essential that similar coordination be maintained for administrative and planning prupeses between the Canadian Meteorological Service and the U. S. Weather Bureau. To that end all messages or other information concerning the Eureka Sound program received in either office will be forwarded promptly to the other. Matters requiring joint consideration will be decided by mutual agreement.

COOPERATION

The success of a joint international program depends on maximum cooperation by all personnel involved, both as between nation-

THIS PAGE IS UNCALSSIFIED

alities and individuals. It will be the primary responsibility of each individual to maintain cooperation and cordial relationships through the exercise at all times of tact and understanding. Responsibilities and privileges as outlined above are set forth largely in anticipation of possible contingencies. Privileges should not be abused and should be exercised with restraint. Interpretation of responsibilities should take into consideration the primary importance of satisfactory cooperative relationships.

CAPABILITIES OF RUSSIAN WEATHER SERVICE

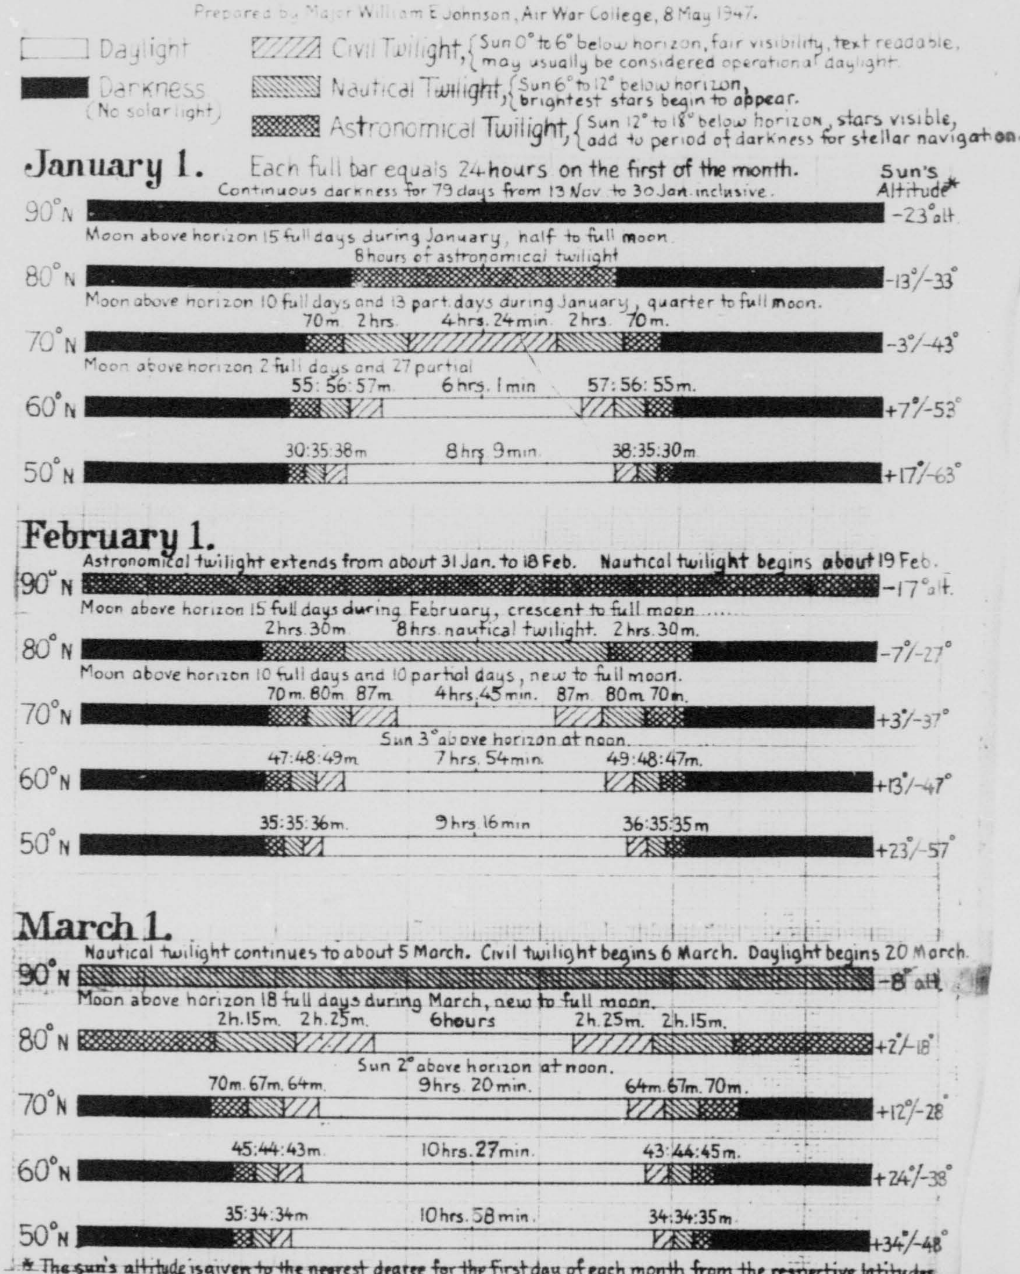
The following information has been obtained from the conversation with Captain A. A. Cumberledge of the Navy, who was in charge of the Navy Weather Central at Khabarorsk during the latter stages of the war, and from Major Delmar Crosson, who operated in the China Area and received information exchanged with the Russians. The Russians have considerably more experience in operating in the Arctic area than the United States. It will be noted that most of the rivers north of 60° drain into the Arctic Ocean, and it is along these river arteries that the Russians have established most of their weather observation stations. The number of stations that they have above 60° is not known exactly. However, the inclosed map indicates the approximate number. Not all of these stations report. No estimate is available as to how many are reporting or are in operation at the present time because of poor communications around the world. During the war approximately 40 per cent of these stations were received on an exchange basis with the Soviets. It can readily be seen that they have many more stations in the Arctic Area than we do.

Because of the low priority that the Soviets place on weather information for military operations and the lack of land line teletype facilities, the receipt of weather reports from most of these outlying stations is rather unreliable, and in most instances, reports from at least half the stations will be garbled in one way or another. In some instances, the elevation of the stations are unknown, and the reduction of the pressures to sea level are useless. However, these stations have been ordered to report and do so to the best of their ability.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

The accepted practice of the Sovits of drawing synoptic charts of taking weather observation by time zones limits the usefulness of the charts and the observations. However, with the careful selection of reports as to the time of observations a synoptic map for the entire Soviet Area can be produced, as well as can be ascertained. Only a limited number of raob stations and rawin stations are in operation. Most of their upper-air observations stations use pibals and take airplane soundings. In summarization it can be said that the Soviet capabilities are behind those of the Americans. However, they are potentially capable of equaling the best American efforts.



If the Russians use the route from their homeland by way of Siberia and across Alaska and down the McKenzie Valley, they will be taking advantage of the way weather systems progress in this quadron of the globe, i.e., from west to east and also by takingadvantage of the prevailing winds. In forecasting they will have the additional advantage assuming they have no intelligence reports, other than weather reconnaissance from our territories, and thus having seen the weather first and knowing from past experience what generally happens to systems of that type, they will be in a position to make reasonably accurate forecasts for air and ground operations.

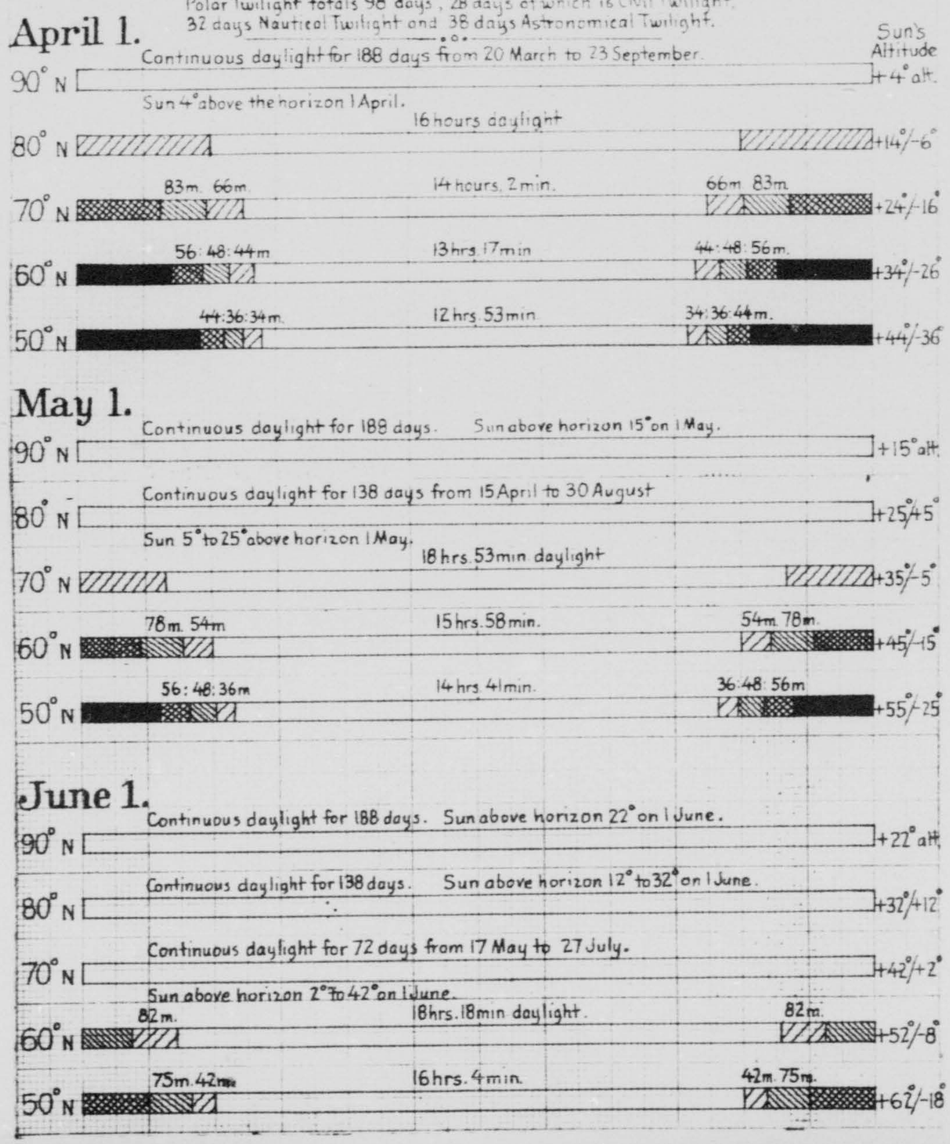
Daylight, Twi[illegible]ght and Darkness in [illegible]e Arctic and Sub-Arctic

Prepared by Major William E Johnson, Air War College, 8 May 1947.



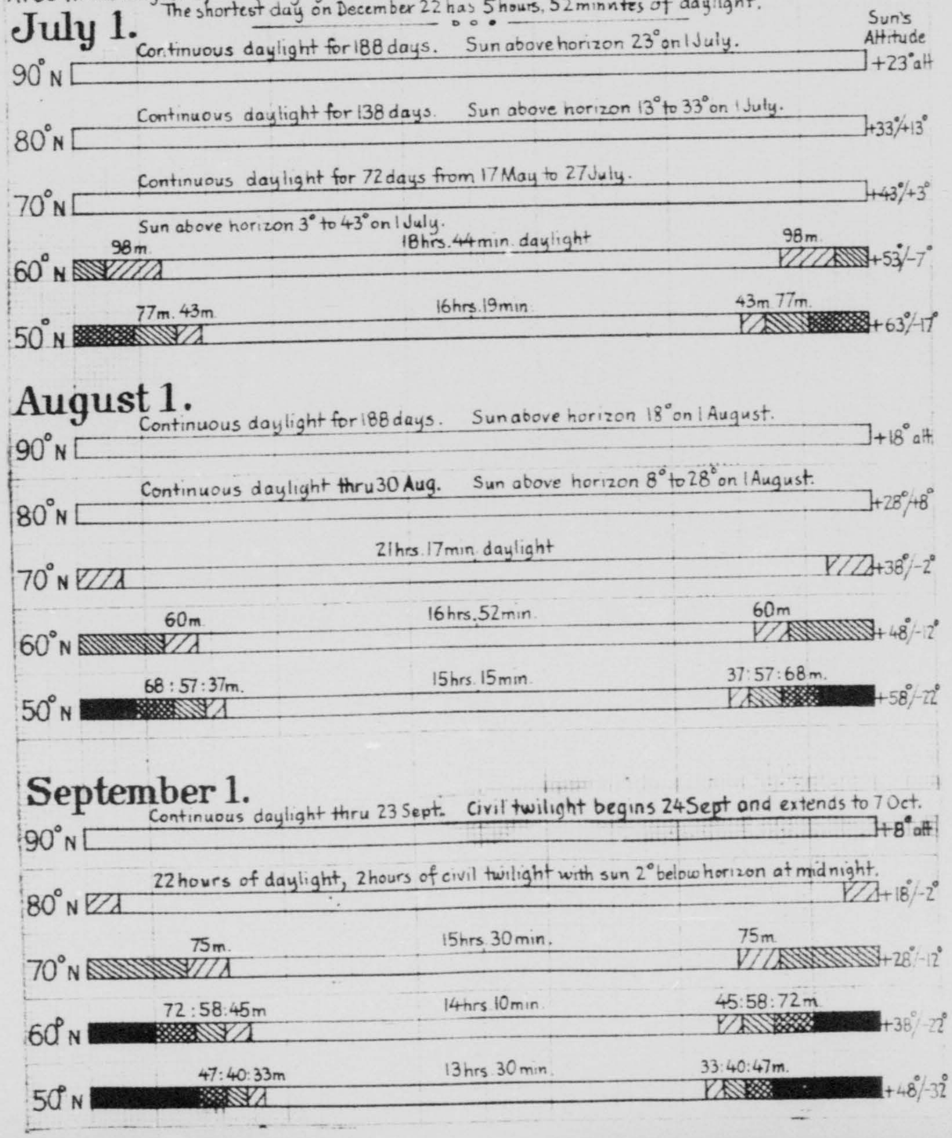
* The sun's altitude is given to the nearest degree for the first day of each month from the respective latitudes.

THIS PAGE IS UNCALSSIFIED

The Solar Day at the North Pole

Dawn twilight at 90° N begins about January 31 with a faint illumination on the sun horizon. Twilight illumination increases for 48 days to about March 13 when the solar orb shows its upper edge above the horizon. It takes 32 hours for the ball of the sun to fully appear while circling the horizon 1⅓ times. The sun then circles above the horizon for 188 days of daylight, slowly ascending to an altitude of 23° 27′ about June 21 and then spiraling to the horizon again by September 23. Evening twilight lasts 50 days to about November 12 when the last glow of reflected sunlight disappears from the horizon. Solar darkness lasts 79 days from about November 13 to January 30 inclusive.

Polar Twilight totals 98 days, 28 days of which is Civil Twilight, 32 days Nautical Twilight and 38 days Astronomical Twilight.



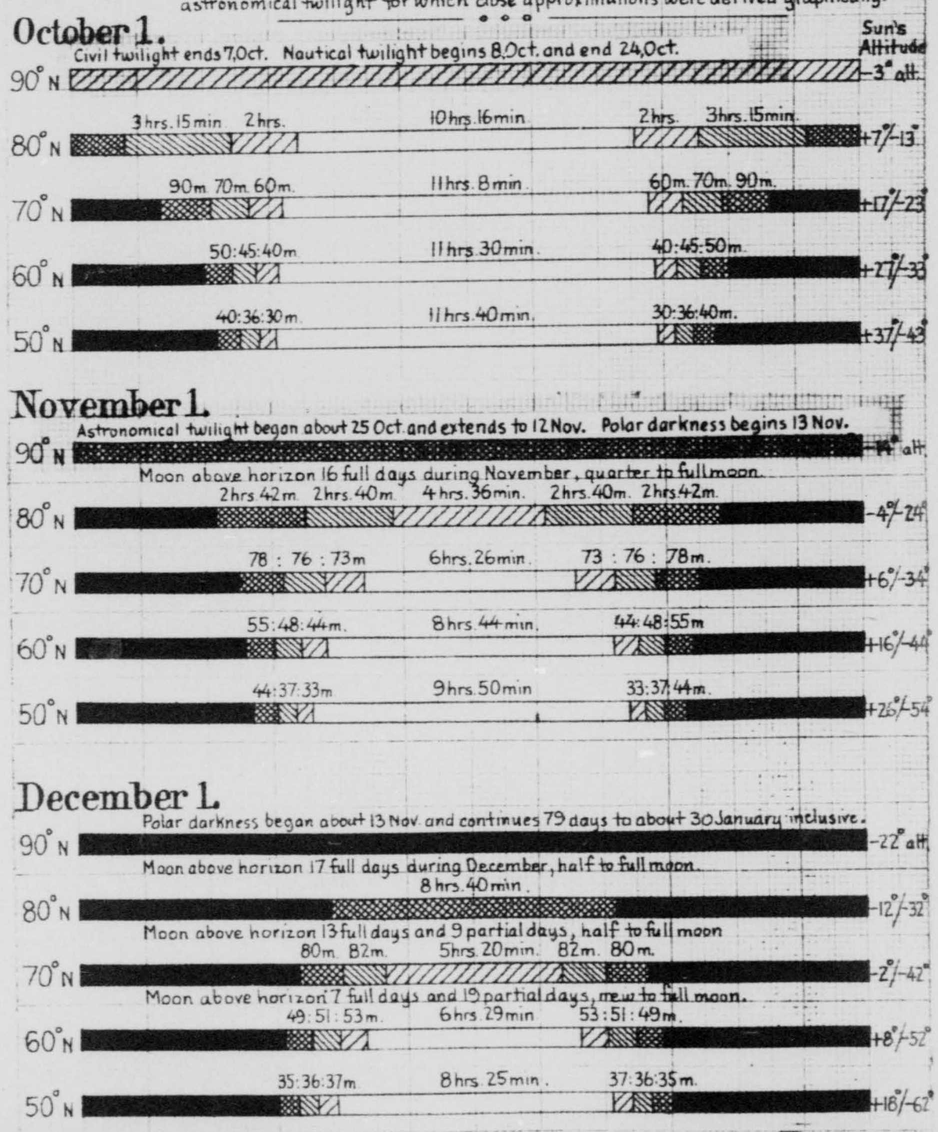
THIS PAGE IS UNCALSSIFIED

The Span of Dayli[illegible]t at Lower Latitudes

At 80°N. continuous daylight lasts 138 days from about April 15 to August 30. During this period the sun swings around above the horizon with a daily variation in altitude of 20°, with the lowest altitude at midnight and the highest at noon. On the darkest day about December 22 there are nearly 8 hours of astronomical twilight during the midday period.

At 70°N. continuous daylight lasts 72 days from about May 17 to July 27 with the sun's daily altitude varying 40° from midnight to noon. The darkest day in December has 4 hours of civil twilight during the midday period.

At 60°N. the longest span of daylight is 18 hours, 53 minutes on June 22 with 4 hours, 8 minutes of twilight. The shortest day on December 22 has 5 hours, 52 minntes of daylight.



THIS PAGE IS UNCALSSIFIED

Moonlight. When the sun is below the Arctic horizon during t[illegible] winter night the moon circles above the horizon during the full moon period. For several days before and after the full moon the illumination is approximately equivalent to that of nautical twilight. At its brightest over a snow and ice covered landscape text is readable.

Altitude. The length of daylight and twilight increases with altitude. See table in back of the American Air Almanac for altitude corrections.

Source. All data is based on The American Air Almanac except that for the periods of nautical and astronomical twilight for which close approximations were derived graphically.

RESTRICTED

Resumé of the Staff Presentation

Delivered by Captain C.C. Todd, Jr., USN

"THE STRATEGIC AREA OF ALASKA, THE ALEUTIAN AND KURILE ISLANDS"

July 20, 1942

The ALEUTIAN ISLANDS are valuable, strategically, to the UNITED STATES and JAPAN for the following reasons: (1) Fish, Furs, Minerals, Timber, (2) Control of UNITED STATES Trade Routes to ALASKA, HAWAII and Coastal, (3) Control of Japanese East Coast Trade Routes, (4) As bases for one route of advance across the PACIFIC.

Their strategic value depends upon (1) Their position, (2) Military strength and (3) Resources. The Islands form the right flank of the UNITED STATES' western strategic front. The islands have a limited potential offensive strength for light surface forces, a small force of heavy ships and an air force of sea-planes. The defensive potentialities are good.

ALASKA has over 100 airports. Naval air stations capable of rapid expansion are being developed at WOMEN'S BAY, KODIAK, at SITKA and on UNALASKA in the ALEUTIANS. KODIAK will be the supply base for future air stations in this area. The Army has established Alaskan airfields at FAIRBANKS and ANCHORAGE. There is an excellent radio net to add to the strategic Value of the Islands.

The weather in the ALEUTIANS is cold, damp, foggy and stormy. The average rainfall is 60-80 inches compared to 40 inches in NEW YORK. The average wind is one or two Beaufort Numbers higher

THIS PAGE IS UNCALSSIFIED

than NEW YORK for the corresponding month. The number of days with winds of gale force is about two-thirds of NEW YORK, but exceptional months have been recorded with twice the usual number of days. The gales last longer. The moisture in the air and the rough seas combined with an average temperature of 29° to 51° coats vessels and planes with ice in the long winter. The prevalent fog limits the favorable flying time, in the summer, to a small number of hours per day. Local squalls or "williwaws" make the anchorages dangerous in most harbors.

There are many resources in ALASKA, but none are produced in sufficient quantity for immediate military use. There are no military industries in ALASKA or the ALEUTIAN ISLANDS.

The sites for main bases in ALASKA and the ALEUTIANS include KACHEMAK BAY, CHIGNIK BAY and the COLD BAY - DOLGOI HARBOR Area. KACHEMAK suffers from great tides, currents, and ice. It is only a temporary summer anchorage. CHIGNIK is too open and too close to a better area, COLD BAY. The latter site is not perfect but is the best available.

The two largest Subsidiary Bases are KODIAK and DUTCH HARBOR. They are open to certain winds, are deep, and subject to williwaws, but otherwise fairly satisfactory. Smaller forces could use MONTI BAY, POPOF STRAIT, ANDERSON BAY, NAZAN and KULUK BAYS. There are more than twenty smaller anchorages well distributed thruout the area, the best being: (1) KETCHIKAN, (2) REDOUBT BAY, (3) SILVER BAY, (4) SITKA, (5) CORDOVA, (6) PORT ETCHES, (7) ZAIKOF BAY, (8) MIST HARBOR, (9) AKUTAN HARBOR, (10) ENGLISH BAY, (11) CHERNOFSKI

THIS PAGE IS UNCALSSIFIED

HARBOR, (12) KULILIUK BAY, (13) USOF BAY, (14) CONSTANTINE HARBOR, (15) KISKA, (16) CHICHAGOF, (17) SARANA BAY, (18) SAND BAY, (19) MASSACRE BAY. These bases are well situated for the protection of lines of communication in the Northern PACIFIC.

AVACHA BAY, in Russian S.E. KAMCHATKA is an excellent site for a main base but ice-bound in the winter. There are no resources.

The weather in the KURILES is about the same as that in the ALEUTIANS. The sites for bases are at the ends of the 600 mile chain of islands. It is known that a strong Japanese Naval Base is being constructed on KASHIWABARA BAY. There are finished Main Bases at NEMURA BAY, HAKODATE and MUTSU GULF. A subsidiary base had been completed at OMINATO and one is nearly constructed at MATSUGAHAMA, one could be built in AKKESHI BAY. The anchorages in the center of the KURILES, BIRA SENTAI, HITOKAPPU and RUBETSU BAYS are open to the wind and sea from some direction.

The Japanese and the UNITED STATES Navies are aware of the strategic value of the northern theatre.

H H Crosby
H.H. CROSBY
Captain, U.S.N.
Chief of Staff.

Summary of Staff Presentation

THE NORTH PACIFIC - BERING SEA AREA

Captain C. C. Todd, Jr., U.S.N.

August 25, 1942

The shortest route from the United States to the main islands of Japan lies along the shores of southern ALASKA, ALEUTIAN ISLANDS, KAMCHATKA PENINSULA, and the MARITIME PROVINCES of RUSSIA. East of the 180th meridian we find two main base sites, seven subsidiary sites, and about 20 small anchorages in southern ALASKA and the ALEUTIAN ISLANDS.

The BERING SEA is characterized by its eastern half being comparatively shallow and the western half deep. Its waters are usually open to navigation the year around south of the PRIBILOF ISLANDS, with the open seas extending to the BERING STRAIT in mid-summer. Navigation is difficult due to severe climatic conditions, particularly fog, fresh winds, and lack of detailed surveys. There are no main base sites in the BERING SEA although there are numerous anchorages which can be used during favorable periods of weather. Small anchorages are found in the PRIBILOF ISLANDS, NUNIVAK ISLAND, ST. MATHEW, HALL ST. LAWRENCE, STEWART and ST. MICHAEL. None of these anchorages afford any facilities except fresh water and all are exposed to the sea. There are no harbors along the ALASKAN coast in the BERING SEA which afford facilities. The town of NOME has some limited facilities but no harbor.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

In the western BERING SEA the only useful island base site is in the KOMANDORSKI ISLANDS where a base capable of handling a moderate naval force has been developed.

In the MARITIME PROVINCE OF RUSSIA which extends from the BERING STRAIT to the northern boundary of CHOSEN including the northern half of the island of SAKHALIN we find a mountainous country with poor communications, a cold climate and few developed resources.

In this area the principle ports of any value are PETROPAVLOVSK, CASTRIES BAY, SOVIET HARBOR and VLADIVOSTOK. All of these harbors are generally good but are lacking in base facilities.

CHOSEN on the ASIATIC mainland, formerly known as KOREA, marks the beginning of JAPANESE territory which now extends throughout eastern ASIA to TORRES STRAIT just north of AUSTRALIA. Across the SEA OF JAPAN lie the main JAPANESE islands which contain the centers of production for war materials and shelter the vast majority of the JAPANESE population. The majority of harbors on the ASIATIC mainland in CHOSEN are comparatively shallow and can usually handle only vessels of moderate draft. Among the best are RASHIN, GENSAN, FUSAN, and CHINKAI. In the main JAPANESE islands we find a country that is mountainous and volcanic in origin with modern and ample communications.

The climate varies from north temperate to sub-tropical with the rainy season from June to September with typhoons occurring on the west coasts during the summer.

While there are many anchorages in the islands the only fol-

THIS PAGE IS UNCALSSIFIED

lowing naval bases have been fully developed: MAIZURU on the JAPANESE coast of the SEA OF JAPAN. The northernmost base in the main JAPANESE islands is at OMINATO, at the eastern entrance of TSUGARU STRAIT.

In the southern half of SAKHALIN ISLAND, there are practically no harbors, OHA on the east coast being the principle port of call during four summer months when the port is free of ice. In JAPANESE SAKHALIN anchorages can be found practically anywhere along the eastern and southern coast subject to the vicissitudes of the weather, but the west coast is steep-to. PATIENCE and ANIWA BAYS are huge bights but offer no protection from offshore weather.

The east coast of the island of HONSHU north of TOKYO provides only harbors in the SENDAI area. Near TOKYO is the YOKOSUKA naval air station together with numerous other Navy and Military air fields and fortifications for the protection of YOKOHAMA and TOKYO. The other major naval stations on the JAPANESE mainland consist of JURE and SASEBO.

This very brief outline of the ASIATIC territory covered is very extensively covered in O.N.I. monographs and previous detailed studies on file in the archives.

H.H. CROSBY
Captain, U.S.N.
Chief of Staff.

File: 372.2 (14 Feb 44) 14 February 1944

ARCTIC AIR ROUTES VIA CENTRAL CANADA

(Outline and description of hazards, weather and communication facilities with regard to operations - present and future, of aircraft, military and commercial, using Arctic routes through Central and Northern Canada.)

I. REVIEW

As the most direct route to all our present battlefields is through the Arctic, post-war operations may also be expected to use the northern routes. Air passage through the Arctic offers to the United States a vast saving of money and time since the northern routes are not only direct, but short.

At the present time, Canada and the United States (Alaska), Great Britain and Russia stand back to back against the North Pole, thus being in a position to control the compact Arctic area with a minimum of effort. It may be anticipated that, ~~after the war,~~ the main arteries of the manufacturing and food producation nations (United States - Canada) and war-worn nations, particularly Russia, China and Britain, will lead across the Arctic.

THIS PAGE IS UNCALSSIFIED

At this present time also, it is the Canadian and Russian bases, backed by the British Navy and American planes which effectively shut out the Axis from the entire Arctic regions. These bases, with the great fund of valuable data now being collected daily, will be invaluable for post war operations of commercial aircraft. While the United States and Canada are still lagging behind Russia in their exploitation of the arctic regions for purposes of aviation, great strides have been taken not only in construction of bases, weather stations, improvement of equipment and training of personnel, but in planning and a fuller realization of the hazards involved. That these hazards and problems are fewer than was originally expected is most important. That they are by no means unsurmountable is encouraging.

II. HAZARDS

The two main hazards to aviation in Arctic regions are linked together; weather, as such, and equipment as it is affected by that weather,

In the central Canadain Arctic and sub-Arctic regions, low temperatures and strong winds must be overcome. In the eastern Arctic, Labrador, Baffin Island and southern Greenland, fog, much snow and low temperatures are frequent. The same conditions prevail in the western areas, Alaska, northern British Columbia and the Yukon.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

Severe Arctic weather conditions with their natural effect upon equipment designed for use in temperate zones has created a need for study and experiment. Much has already been accomplished in this direction by U. S. Air Corps, Ordnanae, Quartermaster and Engineer Branches for beyond the Arctic circle. Cement runways have been laid in sub-zero temperatures, for instance Churchill, and hangers built while 1" bolts and nuts snapped into pieces in the intense cold (Churchill, Southhamption Islnad and the Pas.) Aircraft have operated in some of the most hazardous country in the world and routine schedules have benn established. For instance, during five month's period, January - May, 1943, in the Churchill, Southampton Island, Hudson Bay Region, there were no more than five whole days of instrument flying weather. (During nine days in February, 1943, one C-47 aircraft operating between Churchill and Southampton Island, carried a total of 271 personnel and 137,094 lbs. of freight.) This five month period was judged to be themost severe, from a low temperature standpoint, of any winter for a considerable number of years. Icing conditions are under control. Late type compasses are in use where magnetic compasses are of little avail. Weather stations are now operating on a 24-hour basis at numerous isolated sopts throughout the Arctic. Radio beacons have proved very satisfactory. From United States' bases in Arctic and sub-Arctic regions, rescue mission have many times been performed successfully

THIS PAGE IS UNCALSSIFIED

under most adverse conditi ns. On two occasions,U. S. officers parachuted to earth without mishap and many lives were undoubtedly saved - (Fort Ross, Clyde River).

There remains such to be overcome, Long-range heated aircraft are needed on the Artic routes and those crossing over the Greenland icecap must have pressure cabins. Additional weather stations, radiosonde stations and emergency landing fields will be needed for post-war operations of aircraft over the Arctic routes. Experienced personnel must be trained for the rigorous life of ground crews in the Arctic zones. Further developments and improvementsin clothing for high altitude flying are required since high altitude frost bite is distinctly different from any other type of frost bite, and the hazards entailed in high altitude flying call for paricular attention being given to this point. In this connection it has been found that the health standard of all personnel in Arctic and sub-Arctic regions has been extremely high; casualties from low altitude frost bite few, and such afflictions as cold and influenza are quite rare.

III. WEATHER (GENERAL)

From a standpoint of wather, to judge from reports received from all points, North Central Canada, in particular the Hudson Bay regions, offers unusual opportunities to post-war avaition. (These opportunities are available also for war time

THIS PAGE IS UNCALSSIFIED

planning.) Bases are already established with a network of advanced weather stations supplying hourly weather reports. Communications and weather facilities have been established and are operating with a maximum of efficiency. During the past two years, experiments and tests have been carried out, and much data collected. It is felt that this central Canadian Arctic region offers unlimited opportunities to aviation. As has been stated previously, weahter in the east and the west invariably is woree than that found in the central Canadain Hudson Bay regions. For example, see the following summary of climatic data taken from special report No. SRA-2 of the Arctic Section, Arctic, Desert, and Tropic Information Center, Army Air Forces Proving Ground Command, Eglin Field, Florida.

Temperatures: (Comparisons are made between Churchill, Man. and Fairbanks, Alaska only as an example.)

Churchill is consistently colder than Fairbanks in all months except October, November and December. The higher fall and early winter temperatures at Churchill probably result from the ameliorating effect of Hudson Bay previous to the time when it freezes over along the coast. It is likely that in the interior west of Churchill the October to December temperature is even lower than for the same period at Fairbanks. Each station has seven months with mean temperature below freezing, but Churchill has one additional month during which the mean daily temperature is usually below freezing. This

THIS PAGE IS UNCALSSIFIED

longer winter is indicated not only in the mean temperatures but also in the length of the freeze-over period. Churchill's being thirty days shorter than Fairbanks. Extremes of temperature oover a wider range at Fiarbanks. The mean mazima and mean ninima at Churchill are consistently below those at Fairbanks in all but three months. The data indicate that Churchill has a period of repeated thawing and re-freezing in the spring which is quite typical of the Arctic. At Churchill, there is much more wing and consequehtly the snow usually packed hard and often is blown off open areas.

Fog: Fairbanks has much more fog than Churchill. Further, a big percentege of the fog at Fairbanks is the light type which often does not seriously interfere with flying.

Cloudiness: There is 14% more cloudiness at Fairbanks than at Churchill.

Thunderstorms: There are three times more thunderstorms at Fairbanks than at Churchill.

Daylight: Churchill is about 6° further south than Fairbanks. This additional light might be especially desirable with respect to flying.

Transportation: It is obvious that Churchill is much more accessible to all parts of the United States

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

Than Fairbanks. For purposes of war planning, Churchill is in a less strategic location and therefore less susceptible to disruption of transportation by bombing raids.

IV FACILITIES

Throughout the central Canadian regions, from the Headquarters, U. S. Army Forces in Central Canada at Winnipeg, through the Pas, Churchill and the Hudson Bay coast, Southampton Island in the Northwest Territories, communications facilities are now functioning most efficiently. From these bases, at each of which U.S. forces are the sole users, there are networks of advanced weather stations that have been in operation for more than a year. Co-operation with and from Royal Canadian Mounted Police and Hudson Bay Company outposts has linked together the Arctic islands and the mainland.

Southampton Island (Coral Harbor), Churchill and The Pas can be easily converted for overnight stops, refueling of aircraft, testing and training grounds. Each has a fully modern hospital equipped with the finest equipment the United States can provide. All three stations are directly located on routes (from Minneapolis, Chicago, New York) to London, Berlin, Moscow, Calcutta, Chungking and Vladivostok.

In the eastern Arctic and sub-Arctic areas (Labrador, southern Baffin Island and south Greenland) U. S. Army bases are already functioning smoothly, as in Alaska, but, owing

THIS PAGE IS UNCALSSIFIED

to generally unfavorable weather conditions in these parts it is probable that post-war commercial aviation will seek to avoid this bad weather area and operate through and from the most central parts of the Arctic and sub-arctic. Experienced U. S. Army fliers, R.C.A.F. pilots, bush pilots from Canada's air lines, having had considerable experience, all affirm the fact that in the central regions weather is more favorable for flying, and, given one or two additional landing fields, it is believed that safe and regular operation of scheduled flying will present no considerable difficulties.

By the construction of an air field at Nettilling Lake, Baffin Island, to supplement those fields now in operation, the entire central Canadian Arctic would be provided with a means of operating to all of the land mass areas of the world and, with a few additinal weather stations, the safety and protection of all Arctic routes would be assured.

In the summer of 1939, Russian fliers alighted on a large ice-floe in the Polar sea. They erected the first of their automatic stations and departed. The station then recorded, at regular intervals, barometric pressure, air temperature, strength and direction of wind, and the depth of the sea at that point. These observations were transferred to an automatic transmitter and at certain intervals were picked up by listening posts hundreds of miles from the drifting station. It is reasonable to assume that this automatic

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

station and those put out at later dates have supplied Russia with a most valuable amount of information.

Several such stations put out in the Canadian Arctic would be of great value to Canada and the United States, adding still further to the safety and protection of aircraft using the northern routes.

At this time, comprehensive studies and research projects on cryology, biology and hydroplgy are beihg made by trained personnle on the staff of the Headquarters, U. S. Army Forces in Central Canada at Winnipeg, Manitoba, Canada. Reports of these investigations are being complied and are believed to be of considerable value. Such investigations will be essential for the safe operation of aircraft over the northern routes in the post-war period.

V. SUMMARY

Existing air fields in north Central Canada and the Arctic now operated by the armed forces of the United States offer for post-war aviation many advantages, not the least of which is a saving of time and money. The addition of a few weather stations and one or two additional landing fields properly located would enable aircraft, operating from north Central Canada, to fly to all parts of the world.

The hazards entailed in Arctic operations are now well known. Research and experimentation have removed many of

THIS PAGE IS UNCALSSIFIED

these hazards and those which remain to be overcome do not present any serious difficulties.

Weather conditions in north Central Canadian Arctic regions have been found to be more suitable for the operation of aircraft than those experienced in either the eastern areas or the western areas. Existing communications, weather and transportation facilities are such that with little addition they will be capable of rapid adjustment to suit present or post-war planning.

THIS PAGE IS UNCALSSIFIED

SOME WEATHER AND CLIMATIC FACTORS AFFECTING ARCTIC OPERATIONS

The first thing that I would like to mention in calling your attention to this chart is the fact that there are erroneous thoughts in lots of people's minds regarding the boundaries of the Arctic. A lot of people seem to believe that everything north of the Arctic Circle is Arctic, and countries, lands and seas south of the Arctic Circle are more or less part of the temperate zone. The climatic limits to the Arctic and sub-Arctic are actually derived from climatological theories brought forth many years ago, more than 50 as a matter of fact.

In those early beginnings of climatology the surfaces of the world were divided up mainly according to vegetation types so that when they began to consider the polar regions and the types of vegetation peculiar to them one of the things that entered in rather strongly was the consideration of the tree line. That in general agrees most nearly at the present time with what is considered the southern limit of the Arctic, so far as we define it, over land areas.

Now, in terms of temperature the Arctic has no month whose mean temperature rises above 50 degrees. That is the warm limitation you might say. In terms of cold in general it can be said that the Arctic has an annual mean temperature of below zero Fahrenheit and is confined to areas which have long cold winters and rather short cool summers.

The inner blue line here represents the southern limit of the Arctic. Over the land areas of Siberia and (the Eurasian Arctic, in other words) and the North American Arctic, there is a pretty close parallel between this line and the tree line.

The limit of the sub-Arctic is the brown line further south. And it can be said that that is the general zone where the monthly mean temperatures in the summer

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

do rise above 50 degrees [illegible] three months but not over fou[illegible] months.

That is about the simplest way of arriving at a boundary of the sub-Arctic. Actually there are large areas in the sub-Arctic where winter conditions are more extreme than in the Arctic itself. For example, in the large continental area here ---the sub-Arctic area in Russian Siberia, they have extreme cold conditions. In this area there are some very cold pockets of air gathering and temperatures have been observed as low as 95 degrees below Fahrenheit.

Similar conditions are found in the interior of western Canada and Alaska, but because the area of the land mass and the distance from the sea is not so great in this area (indicating) extreme temperatures do not reach such low values.

I have a slide here which shows annual minimum temperatures which may be expected, and the coldest areas will show up better on those charts.

Now, the Greenland ice cap is an area which we know very little about actually, and I personally have been disappointed that more people have not been interested in finding out more about it, but we do know this: the Germans had a very small expedition up there in 1931. The party on the cap itself consisted of three men, and their dwelling was an ice cave underneath the surface. They expected to have more equipment up there than they finally would up with and they had a pretty rough existence, but their records are actually the only year's record we have from the Arctic.

There the annual mean temperatures turned out to be the lowest ever recorded anywhere in the world, actually it was below minus 20 degrees Fahrenheit for the year, and the mean temperature for December, January and February averaged minus 60. It will, I think, be shown very definitely that this area of Greenland is colder than the cold spot of Siberia.

There are a couple of things I wish to point out regarding the distribution of the truly Arctic area of the Northern Hemisphere. One is that in our own possessions in the Northern Hemisphere, in northern Alaska, there are only a very few small patches of land which are truly Arctic and right off the bat we have no bases in

THIS PAGE IS UNCALSSIFIED

Alaska which are Arctic s e are not too concerned with t most extreme conditions of the Arctic as far as Alaska is concerned.

The North American Arctic does have the greatest proportion of land mass anywhere that can be called truly Arctic. True, the bulk of this is in Danish Greenland and large areas of the land there are elevated well above sea level. The rest of the area is mainly in the Canadian Archipelago, and the land mass that can be considered truly Arctic, the combined mass, is a great deal more than the Eurasian Arctic has.

I think that is as far as I will go with the boundaries.

(Following was illustrated by means of slides.)

One of the reasons for looking into the extreme temperatures that could be expected on an annual basis was that during the war we winterized a great deal of our equipment to operate at minus 65 degrees Fahrenheit, and as you probably know we never operated in any area for any length of time at least, except in the upper air where equipment had to operate at minus 65. One of our coldest bases was in Fairbanks and while minus 65 is reached there from time to time in the course of years, normally minus 40 or minus 50 is pretty cold for Fairbanks, and throughout the Arctic we just weren't operating ground equipment in areas where temperatures of minus 65 are reached, and the question came up as to whether it could be worthwhile to winterize equipment at that low temperature.

What will become apparent when we can look at this diagram is that there are large areas where temperatures as low as minus 60 and 65 can be expected annually.

The upper atmosphere in general above the Arctic is warmer than the surface temperatures. The boundaries here won't show any too well but I will follow them around the pointer. This area is in the so-called "icebox of Siberia, or refrigerator," and can expect minus 60 degree temperatures annually. The same holds for a large area of the Greenland ice cap.

THIS PAGE IS UNCALSSIFIED

The next temperature boundary is the minus 50 degree line which moves around like this, a somewhat larger area in Siberia than the minus 60, and the minus 50 line wanders all over the North American Arctic. It closely parallels the minus 60 line over Greenland and then it comes quite far southward in this area and moves across -- extends out here and in general the configuration here is determined by the ice covered waterways, they are warmer than the land masses. Then the minus 50 goes back up -- and this is strictly inference out here, this is an area of very consolidated ice but I believe when we do have observations from there it will turn out to be almost as cold as the continental area.

Minus 40 comes way down here in the Quebec-Labrador area and has a very narrow extension through here. This area is almost broken off. But there is a large area in North America where minus 40 can be expected annually, and I would like to call attention to some of the possibilities within those limits.

In the minus 60 area; that is an area where you can expect minus 60 every year, minimum temperatures of minus 70 may occur in any year and -80's have been recorded. And in the minus 50 area minus 60 may occur. In about a quarter of the minus 50 degree area minimums below minus 40 may occur for a month straight in a cold winter.

In connection with operation in the Arctic one of the limiting factors, I think the greatest limiting factor, is probably temperature. I am going to talk more about clouds in a moment. But if it weren't for the cold temperatures there probably wouldn't be any great trouble other than problem of terrain and supply and so forth. But it is difficult to operate in cold temperatures. That factor is not applicable strictly to air operation once the plane is in the air, but it does introduce problems of ground maintenance.

In ground force operations the combination of wind and cold, the wind chill factor, is one of the most limiting conditions. The exposed coasts of the Arctic, such as all this coast of the Eurasian Arctic, has rather strong southwesterly winds

THIS PAGE IS UNCALSSIFIED

in the winter -- that is because of large pressures developed over the continent. The coastal waters, even though ice covered, are relatively warm and have lower pressures. You get southwesterly winds along the coast and that raises a drift on the average of about 15 or 20 days a month in many exposed localities, and it gives us a tough operating condition. The same wind chill is found along the coast of Alaska and strongly down around the Hudson Bay area.

In connection with this area that I have indicated is close pack ice all the year -- that is of great importance to sea operations. That is an area where even the most powerful ice breakers that we have today will have trouble. The outer limits of that area in general have not been penetrated by ships. There is one small area over here where a ship was frozen in, crushed and drifted across but that couldn't be called a successful operation.

In another area over here (indicating) a very famous ship, the Fram, was frozen in in 1888 and drifted across part of this area but from what we know even a modern ice breaker would have trouble penetrating any point beyond this edge around here.

Now that goes for sea operations in summer -- the best time of year. In the winter ordinary shipping is frequently closed from the St. Lawrence altogether. There is some open water which extends pretty well up here in Baffin Bay where normal shipping could operate pretty far up in the Davis Straits. Then there is a belt of pack ice along the east Greenland coast and shipping in the winter more or less would have to stay beyond this line 50 to 100 miles off shore. It is true that Spitzbergen is farily open to shipping even in the winter, but in general the open water navigable to ordinary ships is pretty well cut off at that point as far as any further eastward progress goes in that sector of the Arctic. In the Bering Sea area ice accumulates in the winter and lots of the coastal ports are closed quite far south so that naviga-tion is impossible for most shipping in the northern part of the Bering Sea in winter.

The next diagram is a simplified presentation of the major air sources and frontal zones. Actually these are the ones that affect the North American Arctic, and I will

THIS PAGE IS UNCALSSIFIED

have to indicate the sources affecting the Eurasian Arctic. The major high pressure ridge over Siberia is centered generally in the area around Lake Baykal. There is a strong southwesterly flow along the Eurasian Arctic Coast and deep disturbances come up with warm Atlantic air far along this front in the winter. The major source of war air coming toward the Pole in the winter is up along this Eurasian Arctic front.

The Siberian source region of cold air has been emphasized before in connection with its very cold surface temperatures. This air frequently moves slowly across the Arctic Basin and affects the North American continent. In the Canadian Archipelago lies an area that we have neglected too much as far as getting observations is concerned. There are a few stations scattered along the mainland coast but none up in the Archipelago and none out over the ice fields to the northwest, which are believed to be very cold. That is an important source for cold air that can supplement any coming across from Siberia or in itself give extreme cold throughout the middle of North America. The mechanism for some of the cold outbreaks over North America will be indicated in the next diagram.

Here we see at intervals of approximately three days that a large cold air mass has moved across from Siberia to the North American continent. There is one thing here that I would like to point out in connection with air operations. The movement here across the Pole is approximately that of the upper air winds and this is the most favorable route, so far as we know, for aircraft making a return trip from the Eurasian Arctic through the North American Arctic. The weather is much more favorable across here than a normal route over by Iceland, or up around northern Greenland because of the storm tracks that are found up there in that area. The intervals between the position lines are approximately three days and it may be seen that the shallow mass of Arctic air received a reinforcing impulse from the Pacific at very high levels, causing a very severe cold wave in lower latitudes.

THIS PAGE IS UNCALSSIFIED

The main purpose of this diagram is to indicate the importance of increasing our knowledge of our own North American Arctic. As I said before, this whole fringe is completely without any weather observations at all, and if we are going to increase civilian or military air operations up there it will be necessary to get a lot more observational data from that area.

This next diagram is rather interesting. Again going on with our concept of how much observational material is available, we see upon the Eurasian side that there is a great density of stations. The Franz Joseph Islands, including Rudolph Island and Tikhaya Bay are the northern most stations. Rudolph Island is the northern most station which the Russians have access to on land, at least. Of course, they have operated a station right at the Pole by putting it in with aircraft. But there is a great density of weather reporting stations across the Eurasian Arctic, and there is no such density at all in our North American Arctic. There are a few first order stations -- about three fall in the North American Arctic, north of the Arctic Circle. More have been proposed but as yet they are not in.

On the next diagram we have a number of possible flight tracks in case commercial or military traffic across the Arctic ever warranted such flight paths. Again I would like to call your attention to the fact that any route crossing the North Atlantic storm area,which extends up into the Arctic north of Norway and Sweden, would cross one of the stormiest storm belts in the world, especially in winter.

Now, with the advent of stratosphere flying it is possible probably to top most of those disturbances above 30,000 feet: that is on a very direct route across, the weather factor shouldn't be too bad. But on routes across the Pole we are faced with the fact that, because of our reluctance in the past to develop a weather reporting network in the North American Arctic, we have very little information about the day to day conditions over a large part of that area.

Again this happens to be a diagram that was prepared for the purpose of showing how poorly we compare with the Russians so far as the development of a polar network

THIS PAGE IS UNCALSSIFIED

of stations is concerned. Before leaving this I would like to say again that as things are now it is hard to argue that we should increase our knowledge of the North American Arctic unless we have some purpose for it, but I think from the standpoint of pure science alone there is enough reason. We have very little geophysical information on most of the area, but if we ever want routine flights across the Arctic we will certainly have to get more information from that area.

The next slide is concerned with certain specialized Arctic phenomena. All the cold air we find up there has to be produced pretty much on the spot. It is produced by the absence of incoming solar radiation of course, and the outgoing radiation. This diagram shows the relative speed with which cooling goes on and the heights to which it extends.

The next slide shows some ice floes, a natural product of the cooling that goes on up there in the winter. In showing this slide I might go ahead and say a little more about the ice problem. Once the ice is frozen -- and we are concerned with shipping -- naturally the amount and distribution of the sea ice is the primary concern, but even after it has been photographed from the air, ships have traveled through an area and found that conditions had changed very rapidly due to the movements caused by wind. The actual change and amount of ice from year to year has a large effect on the characteristics of the air in the Arctic but as yet it hasn't been possible to use that very successfully in forecasting.

Now, the next slide shows an auroral formation. Many observations of the aurora have been made in the Arctic. One of the primary uses that we can make from these auroral observations has been to determine the composition of the upper air at high levels over the polar regions. An idea of the temperatures at high levels up to 60,000 to 90,000 feet can be obtained from these observations. Perhaps the most important way in which the aurora is concerned with the polar operations is its effect on communications. Auroral disturbances and the ionospheric storms which are associated with unusual auroral displays can disrupt all radio communications.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

During the recent development program in the north, called Operation Hancok, where both the Army and Navy have been supporting the U. S. Weather Bureau, there hasn't been any blackout of the radio to amount to anything this winter, but there were some very prolonged ones amounting to four or five days when communications, both high and low frequency, were quite affected and there was no communication from ship-to-ship or air-to-ground over very short distances for a matter of two or three hundred miles. The weather bureau says of this communication difficulty: that if you have to be economical equipping an operation it is perhaps just as well to count on high frequency communications -- from reports the low frequency won't get us through, and the high doesn't either. So, a lot of this bulky and heavy weight low frequency equipment isn't absolutely necessary unless you can afford to transport a heavy weight of material up there.

The next diagram shows a simple case of rime forming on an aircraft wing. The rime has been broken free where the boots have broken it off. The icing problem is something that I feel has been rather over-rated in the Arctic. It is true that you can get frost formations on the wings of parked aircraft overnight, and frequently there is ice when you fly from a very cold surface layer up into the warmer layers above. But the outstanding examples of these situations are what we hear about and so far we know very little of day to day operation of aircraft up there, except in sub-Arctic coastal areas. The extreme cold is one thing which operates to hinder much ice. In areas of extreme cold there generally isn't much cloudiness and very little moisture in the air. It is true when you go through the Atlantic Arctic fronts there may be very severe icing situations, but in general the icing situations over the United States, over temperate latitudes, where we are accustomed to operating can be much more severe than those normally encountered in the Arctic.

At this stage I would like to begin specifically to discuss some of the outstanding factors affecting air, ground and sea operations from the weather viewpoint. I have already indicated that in connection with Arctic air routes, coming say from

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

Central North America to the Central Eurasian Arctic, or in this case say from Chicago to Moscow, that the strongest frontal zone or storm area that will be crossed is usually associated with the Atlantic Arctic front.

In that area, there will be hardly a day when there isn't some kind of a disturbance and all the hazards of low clouds, if you have to fly low, where icing will be found almost continuously. Now, the answer I believe to regular routine flights across these stormy areas is to be found in high altitude flying, and only in rather rare cases when there are strong flows of tropical air at extremely high levels, that is, above 30,000 feet, will there be much difficulty in going over the top.

The storms that come up through the Aleutian area rarely affect the inner belt of the Arctic or true Arctic, except in some situations where strong southerly flows are quite persistent and cause a large amount of warm air to spill over into the Arctic across Alaska. That is usually in connection with some storm which has come north on the Eurasian Arctic Front and comes all the way around without filling. Normally the storms that come up between Greenland and Norway gradually move east northeast and fill before making a complete circle of the Arctic ice fields.

The best weather for flying across the Polar sea itself will normally be found across between the Lena and Mackenzie Rivers where there is generally an extension of the Siberian high pressure, and as I have said before these conditions are generally favorable for a flight from west to east because of the circulation at intermediate and high levels which generally gives some tail components. So, whereas you could fly from Chicago to Moscow in a well pressurized plane at high levels, I believe many obsolete types of aircraft having the desired range are fairly safe to fly across from Eastern Siberia to Central Canada.

The winter conditions, while severely cold, are in general much better as far as cloudiness and visibility go than the summer. In the summer the percentage of low clouds and fog over all of the ice and much of the water areas of the Arctic and the sub-Arctic is very high, with low clouds almost all the time out over the open

THIS PAGE IS UNCALSSIFIED

sea. Low clouds more than 70 per cent of the time and fog occurring along the coasts, especially through the Eurasian section of the Arctic Ocean, and similarly along waterways of the Canadian archipelago with fog for as many as ten to twenty days of the month.

One of the things that sometimes is annoying to navigators is the continuous daylight. At first glance you would think that was an advantage, but celestial navigation by star sights is preferred to sun sights. At first the 24 hour daylight of summer would appear to be quite an advantage to air navigation, actually when you get to it there is so much low cloudiness you can not get good photographic reconnaissance, as a rule, and there is continuous sunshine so that you have only got the sun for fixes.

One thing about this low cloudiness however, once we have mapped the terrain by radar the navigation will be quite simple. Navigators that have been operating in the north American Arctic enough to become familiar with the land outlines they see on the radar are able to go pretty much anywhere just as though it was contact up there. That is the way the navigation has been carried out for most of the flyin that has been done along the west coast of Greenland to Thule, and for identifying landfalls coming along the west coast of Baffin Bay. The navigator who has been making most of those flights is now quite familiar with the outlines seen by radar so that low cloudiness has been largely defeated as far as that goes. Of course we can not get the reconnaissance through low clouds using radar that you got in the absence of low clouds.

The best operating time in general throughout the Arctic is not in the summer, not in the early winter because fall storminess extends into early winter, but the best time is in late winter and early spring. In most areas that is likely to be shortly after daylight comes back, in February and March and extending until the land masses begin to warm up.

Now, as an example of how little snow there is in the north American Arctic.

THIS PAGE IS UNCALSSIFIED

Thule, for example, has had less snow this winter so far than Washington, D. C. On the Thule air strip there isn't enough snow to operate a skiplane. There are lots of interesting things like that that aren't generally well known. Of course, there are areas that have very heavy snowfall. A great deal depends on the storm tracks. The areas up through the Eurasian Arctic have much heavier snowfall, both on the coasts and the islands, along the frontal zone, and those island masses are much warmer than any throughout the North American Arctic. But in the North American Arctic the storm tracks are far to the south and there is very little precipitation in the higher latitudes in the winter, or in the summer for that matter. The whole area would be a desert if it were not for the cold temperatures which keep the ground frozen for most of the year and save a little moisture for the summer period of thaw.

Referring again to ground operations, the winter is a very severe time for ground operations. The temperature of the air at the level of tracks and wheels may be 15 or 20 degrees colder than it is in the thermometer screen because the temperature gradients right above the snow surface are very severe. So frequently a temperature report may be rather misleading in that it might be 40 degrees below at a thermometer screen and 60 below down a road not far away in a pocket or a hollow.

The point has been made in connection with ground equipment that we only have scattered observations throughout our own and throughout most of the Arctic and therefore the occurrence of low temperatures is widely scattered. The fault is in the observational coverage and we just haven't been all over and found the general pattern of temperature. The wind chill factor, a combination of wind and extreme cold, is the thing that affects personnel involved in ground operations the most. Once machines are started and running it doesn't really matter a great deal how cold it is except in moving parts like tracks, which have rubber components, which would get brittle and break up at temperatures at minus 60, and have been known to do so during continuous operation at minus 40.

THIS PAGE IS UNCALSSIFIED

Outside of such things both ground vehicles and aircraft generally operate fairly successfully once they are started and warmed up, but personnel that have to be exposed to wind and low temperature have to be very thoroughly protected. The Quartermaster substitutes for fur in the form of pile linings and down quilted items, and even quilted fiber glass, are all very successful manufacturable imitations of fur. They are a lot more practicable for use when you have to clothe a large body of men than ever hoping to assimilate the clothing which has been suitable for the natives operating on the ground in the Arctic. Actually the native costume in many ways is quite ideal. The Eskimo out traveling doesn't have to carry much in the way of a house and he is clothed in such a way that he can usually lie down and sleep in his clothing without serious injury. We have to depend on a layer principle of clothing, taking off or adding garments, depending on how much or how little exercise we are getting. Generally we depend on adequate shelter at any place where an overnight camp is to be made.

To me one of the most interesting aspects of ground operations in the Arctic is the fact that tremendous areas north of the Canadian mainland, that look offhand as though they would be a barrier to ground travel, for four or five months of the year are excellent highways for certain types of specialized vehicles. These channels throughout the main archipelago freeze up quite solidly. Some of you probably know that the exercise Musk-Ox last year had rather heavy over-snow vehicles and traveled successfully from Churchill up the coast on Hudson Bay into Baker Lake, and crossed over quite a stretch of salt ice north of the mainland to get to Cambridge Bay. The traveling on the ice in these passages of the southern Canadian archipelago was some of the best they had.

The ice isn't ideally smooth in the most exposed channels but there is every evidence you can find easily traveled routes for fairly heavy mechanized vehicles throughout a large area of the archipelago, to say nothing of the streams, brooks and lakes of the Arctic and sub-Arctic which become highways when they freeze up in the winter time. Similarly the tundra and muskeg is swampy in summer but in the

THIS PAGE IS UNCALSSIFIED

winter you can drive vehicles across the frozen surface and can travel over almost all of such areas.

On the Greenland ice cap itself there are a number of places where you can make easy access from the coast with mechanized vehicles and once on there I consider it a perfect highway. From north to south and east to west you can run vehicles fairly successfully over large areas of the ice cap. This can be done with vehicles that we have now which really can't be considered perfect for over-snow and ice travel. So in winter, you have mobility as far as ground operations are concerned over large areas, but you have to resort to some other type of transportation not especially adapted to ground use to get around in summer.

Now coming back to sea operations, I showed you on that smaller map the approximate limits to winter navigation by unspecialized ships. In the main Arctic ocean areas these are approximately the actual limits of the Arctic. As I pointed out in the Spitzbergen area, the principal harbors there are open every winter. Generally there are few places in the Arctic where you can go in an ordinary ship in the winter time. In the Bering Sea the ports are restricted somewhat further south than the Arctic limit.

In the summer the heaviest ice usually blocks the channels in the Canadian archipelago quite far south, but it has been demonstrated again and again that it is possible to work through the Northwest Passage, if you pick your time and wait, in almost any type of ship. But it would take a number of years to do it that way. Ice breakers will have no trouble going through there, I believe, in any summer. The northern limit to shipping through Kane Basin has never been extended beyond that to which Peary took it to in 1907-09, which is just around Cape Sheridan. Task Force 68 last summer was up there with a Coast Guard ice breaker, but were just attempting to find out the capabilities of the ice breaker. There was no attempt either in this direction or in the Northwest Passage to break any records.

The ice breaker did encounter very heavy ice in the Mclure Strait and

THIS PAGE IS UNCALSSIFIED

cruised through there at about five or six miles an hour through five or six feet of ice with about 6,000 horsepower, not full horsepower, and they were able to make some headway in eight or ten feet of ice. The heaviest ice seen last summer that could br called flow ice was about 20 feet thick, but there were many pieces around 16 or 18 feet thick. I would call them isolated flows, but the big pieces forced the ice breaker pretty far out of the water before the weight succeeded in cracking them. And incidentally that is the way those ice breakers work, they don't split the ice by ramming it but by riding up on it. Actually it is a combination of the two of course.

In northeast Greenland, open water has been found north of Cape Rasmussen. Peary sighted it when he first traveled over there and it has been sighted by Koch and Rasmussen and others who have traveled there, and last summer aircraft reconnaissance disclosed open water east of PearyLand. It has been presumed that there is a general drift toward the east here since the main exit of ice from the Arctic Ocean is between Greenland and Spitsbergen and on down the east coast of Greenland. It is quite possible that further off shore than was observed last summer, or by any of these parties traveling on land, there is a stream of fairly heavy pack. The open water on the northeast coast of Greenland is probably in a sort of eddy there.

If however there is a continuation of, or access to, these bodies of open water that factor would open up interesting possibilities for access by shipping to northern Greenland. It has never been reached that way and nobody has tried very much, especially not since we have had ships that might be capable of doing it, such as the modern ice breaker. We know more about northwest Greenland, and it is my belief that Thule is accessible the year round to ice breakers. One thing we have been keeping an eye on during flights this winter is the amount of open water in Davis Strait and Baffin Bay, in order to get an idea of winter navigational possibilities up there.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

At the present time the Mellville Bight of northern Baffin Bay is frozen up in a normal fashion. We know there has been intercourse among the natives of this shore by sled travel. That is perfectly normal and indicates the ice is fairly fast along the shore. And in flying over the ice there we can see that the ice weakens and breaks away to Baffin Bay. If there were any reasons for keeping a port open near Thule, in the North American Arctic, it could probably be done successfully with ice breakers.

Over at Spitzbergen, because of the warm Atlantic current, no ice breakers are normally needed to get into some of the ports there. The islands of the Franz Josef archipelago are considered inaccessible to shipping in wint r, but possibly some of the ice breakers we lend leased to Russia have been Tikhaya Bay in winter. I am sure they can get there in the summer.

I believe that the route through the Northwest Passage of the North American Arctic doesn't mean as much to us as the corresponding passage does to Russia. The incentives to shipping aren't so great and we probably will never have economic reasons for promoting a heavy amount of shipping across there, but I believe it is quite feasible to count on getting ice breakers across there in the summer if you have to do it. The ice opens up toward Wrangel Island fast r than it opens toward Point Barrow. The general drift in there tends to be clockwise, but there are several eddies in major embayments of the Arctic Ocean. We know that drift has occurred from Wrangel Island toward the New Siberian Islands and then toward Spitzbergen, at quite a high latitude close to 85° N. So there is evidence of a slow curr nt in the Arctic ocean, which could be pretty well counted on, coming around to the west and down between Spitzbergen and Greenland. However, there is supposed to be a current across the Lincoln Sea to the east and the ice has always been found jammed up against its eastern coast. There is apparently no hope of traveling in surface vessels very far to the east or west from the southern Lincoln Sea area.

THIS PAGE IS UNCALSSIFIED

My idea on Arctic navigation -- if the Navy, for example, has to travel in ships in this area, is that the best way to do it is under the ice. I suppose that idea is not traditional and it will be hard to accept. I didn't get my ideas strictly from Wilkins, but I think there is something to his plan. In getting weather or other type observations out there from ships, if that has to be considered, the submarine seems to offer more promise than ice breakers to my mind.

The idea or possibility of locating stations of any type by a combined air and ground operation on the Arctic ice I think is highly faverable in this area, northwest of the Canadian Archipelago, of the heaviest ice which I believe will be found in the Arctic ice fields. I think the ice is more consolidated there the year around than anywhere else. We have some evidence that there are rather large pieces of ice out there, north of Alaska, which might be quite useful for various type stations.

ID 12712

Subject: Arctic Navigational Flights.

From: M.A., Ottawa, Canada

Date 23 May 1945

The key personnel of the crew of an RAF Lancaster Bomber, at present engaged in research flights in the Arctic regions, accorded an interview at the U.S. Embassy, Ottawa, 22 May 1945 and discussed salient features of the research program.

The flights are progressing under the auspices of the Central Empire Air Navigation School, RAF, Shawbury, Shropshire, England, for the purpose of studying problems of navigation in the Arctic. The aircraft used is an operational Lancaster with additional fuel tanks to provide a range of 4600 geographical miles.

Routes followed to date are as follows:

a. Iceland to the geographic North Pole and return to Iceland.
b. Iceland towards the magnetic North Pole. Flight diverted to Goose Bay, Labrador, after crossing Greenland Ice Cap owing to engine trouble.
c. Goose Bay to vicinity of magnetic North Pole and return to Montreal. Routes proposed for the future are:

(1) Ottawa - Toronto - Rivers (Manitoba) - Edmonton - Whitehorse.
(2) Whitehorse to England by an approximate great circle course.

In flights performed to date, navigation has been performed as follows:

a. Geographic Pole flight relied on Loran system with excellent results.
b. Iceland - Goose Bay flight used a combination of Loran and Astro compass.
c. Magnetic Pole flight employed astro navigational aid exclusively and used the dip needle of the Fluxgate Compass to indicate proximity of the Magnetic Pole.

Results of flights will be confined almost exclusively to navigational research. No geographical observations have been undertaken and photographic evidence of geographic or topographic interest will be restricted to the results obtained with two personal 35 mm cameras. Meteorological information will be in the nature of standard observations made during the course of flights.

THIS PAGE IS UNCALSSIFIED

KO 12712

flights.

Detailed reports resulting from these flights will be made available to this office through the RAF Mission to Canada and will be forwarded to MIS upon receipt. Of the results so far obtained, that of greatest significance is the reported change in the position of the North Magnetic Pole from its presently plotted position at Latitude 70°N; Longitude 97°West, to a position roughly in Latitude 74°N; Longitude 100°West. At this position the vertical component of magnetic intensity as observed by the dip needle was 89° with the pole still to the northwest of the point of observation.

It was the opinion of the crew members of the subject flights that while much information of immediate value will result upon analysis of flight records, it would be unwise to accept the data obtained from the flights as indicative of standard conditions. For example, the flights have experienced no unfavorable radio conditions; in fact all radio equipment gave excellent results at all times. Such cannot always be expected. In this and other fields of research, it is felt that only by continued and frequent flights can the overall conditions incident to Arctic flying be obtained. It appears likely that such flights will eventuate as a result of those presently being undertaken, which are to be considered as preliminary and experimental.

Key personnel engaged in the subject flights, all of whom are representatives of the Central Empire Air Navigation School are as follows:

Wing Commander	D. C. McKinley	RAF	(Pilot)
Sqdrn. Leader	A. J. Haggar	"	(Co-Pilot)
Wing Commander	William Anderson	"	(Navigator)
" "	F. C. MacLure	RCAF	(Navigator)
" "	R. Winfield	RAF	(Medical O.)
Flight Lieutenant	S. T. Underwood	RAF	(Navigator)

EO 21443

CONFIDENTIAL

Subject: Arctic Navigation Flights

From : M.A. Ottawa, Canada Date 21 July 19[illegible]

The following report, which is quoted verbatem has been issued by the Empire Air Navigation School, Shawbury, England and contains a summary account of the polar flights of the RAF Lancaster "Aries." Of especial interest is the statement setting forth the form which final reports will take. This office has arranged to receive the completed studies through the U.K. Air Liaison Mission, Ottawa as soon as such are available for distribution. The cited report follows:

"Polar Flights"

"Since the report on these flights promises to be voluminous, it is to be issued in eleven self-contained sections, each complete in itself with it's own appendices. In view of the time required to analyze the fifteen thousand recorded observations, it will obviously be impossible to publish these at an early date. It is proposed therefore to issue a general narrative of the flights as soon as possible to provide a background against which research reports may be more clearly understood.

In view of the wide interest that has been aroused throughout the service by this mission, it has been suggested that a brief account should be included here.

The original plan had been to make the trip in April when atmospheric conditions were expected to be most stable, and when it would first be possible to make the entire trip in daylight. However, it did not prove possible to modify the aircraft in time and the mission was delayed until May.

Fixing was to be achieved by means of sun-moon position lines and therefore a period had to be chosen during which the moon's declination was Northerly and during which the two position lines would give reasonable cuts. Consequently the flights were scheduled to take place during the period from the 10th to the 1[illegible]th of May.

The first attempt to reach the geographical pole was airborne at 0300 G.M.T. on the 1[illegible]th from Meek's Field, Reykjavik but was forced to return to base by severe icing in towering cumulus up to 26,000 ft. over the E.P. coast of Greenland which it proved impossible to circumnavigate However, after a brief wait of two hours, the meteorological forecast showed such a great improvement that it was decided to try again immediately, and Aries was again airborne at 1500 hrs G.M.T. (Note-Probably should be 0500 hrs G.M.T. - [illegible])

In view of the special problems of this flight, to find a hypothetical pinpoint in a frozen sea, a special technique was adapted. The pole was approached with the sun dead ahead so that the sun sights

CONFIDENTIAL

THIS PAGE IS UNCALSSIFIED

 EO 11443

should not be affected by wander. Course was set to take the aircraft slightly east of north, so that a from of "Finding the island" technique could be used, running down the sun position line and using moon position lines to check ground speed.

When by a D.R. run of about 10 miles from the last fix, the most probable position of the pole had been reached, Aries did a rate one turn around it, thus crossing the date line twice in the space of eighty seconds. Petrol was getting short and no other manouvers could be performed to mark the occasion though a small bottle of bass and a Union Flag were thrown overboard to cheer future explorers. Incidentally a Q.T.E. from Reykjavik of 000°T was obtained.

On the return journey to Iceland, conditions for astro gradually deteriorated. A deep blue haze of ice crystals tended to obscure the moon which was well down on the horizon. In this connection it may be of interest that shots of as little as 4°41' observed altitude were used.

The aircraft landed at Reykjavik after a flight lasting 1[illegible] hours 30 min. making a total flying time for the crew of 2[illegible].1/2 hrs out of a period of 30.1/2 hrs.

On the 1[illegible]th, Aries took off for the magnetic pole, but the starboard inner generator burned out and necessitated a diversion to the nearest airfield with long runways, so course was set for Goose 1300 miles away. The following day the aircraft took off for the charted position of the magnetic pole in Boothia Peninsula, but on reaching it the readings of both the magnetometer and dip recorder indicated that the pole still lay in a north westerly direction. The aircraft flew on in this direction for another 200 miles, recording a maximum dip of over 8[illegible].1/2°, but had to turn back since P.N.R. was reached before the pole.

Compasses, which had behaved quite normally in straight and level flight up to this point began to show the expected aberrations as the magnetic pole was approached.

It became necessary to fly the aircraft very carefully since acceleration errors and turning errors, if the aircraft was laterally unstable caused the Gyro Fluxgate Compass to oscillate or even make a complete revolution. Moderate weaving or continued bank caused desynchronization, and it was necessary to put the D.R.C. to "setting" to enable it to pick up any new heading. The actual flying of the aircraft was complicated by the fact that "George" was unserviceable for 50% of the trip.

Aries returned to Dorval after this flight, which seemed to confirm the Astronomer Royal, Sir Harold Spencer-Jones calculations that the present position of the pole is in the region of the Sverdrup Islands.

Canada was crossed in easy stages to reach Whitehorse in the Yukon. The approximate great circle track was to be flown from Whitehorse to Shawbury which would bring Aries to a point just north of the Sverdrup Islands on its way home, and thus give a further opportunity for magnetic observations. Aries left Whitehorse on the 25th of May to reach Shawbury on the 26th. One aspect of this trip has been overlooked by the press, which is that it took place through a change of local time of

THIS PAGE IS UNCALSSIFIED

27 hrs and consequently the sun, which was on the starboard bow in the G.P. at take off, did a complete clock wise circuit of the aircraft and continued round until it was on the starboard quarter.

The foregoing account, albeit brief, will have given some idea of the scope of the general narrative shortly to be issued as Part I.

It is hoped that Part II, the section dealing with general navigation on the flights, will also be published at an early date. This will deal with the methods of navigation employed, such as the use of the A.P.I. in conjunction with the Greenwich Grid System, the use of the pole as an assumed position when plotting astro sights, and the various methods of maintaining direction in a part of the world where magnetic variation was doubtfully recorded and changed with rapidity and where the orthodox concept of orientation breaks down.

Facsimile copies of the logs and charts will be included, together with a carefully determined replot of the tracks.

Part III will deal with aircraft performance, and include an account of the modifications necessary to the airframe.

Part IV is devoted to meteorology, with a comparison of the data obtained in the air with the observations on the ground for the whole period. An account of the weather conditions on all flights is projected with special reference to the unexpected instability of the atmosphere at heights above 12,000 feet in Arctic regions.

Part V will be one of the last to appear as it deals with the compass and magnetic observations, which require exhaustive analysis to yield full value from the data. A discussion of the special instruments carried, and the way in which observations were made, is to form a part of this section also. These special instruments were:

- (i) a three axis magnetometer, used to analyze the components of the earth's field in the horizontal plane;
- (ii) a dip-meter, which when aligned with the horizontal lines of force of the earth's field, i.e. along the isogonals, gave a direct reading of the exact value of a dip at any moment.
- (iii) an automatic observer, housing repeaters from the gyrofluxgate, the D.R.C. and the magnesyn, with a camera to take photographs of these instruments when desired;
- (iv) four direct reading magnetic compasses of very high magnetic moment, but of varying degrees of damping, to enable a study to be made of the effects of the earth's field on a freely suspended needle in this region.

Part VI will deal with communications and radar. Among other matters discussed will be the behavior of Loran. Pulses were obtained in very high latitudes indeed and a special chart was carried on which to plot any such pulses. As, however, frequently in daylight while the transmitter was in the darkness of night the reliability of the signals could not be depended upon at the time, but it is assessed upon the ground from the replot and the logged readings.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

KO 21443

Part VII is devoted to photography and geographical data.

Part VIII comprises the result of miscellaneous research, including assessments of the value of various special instruments carried which include:

- (i) an API driven by the fluxgate compass, employing step by step transmission and fitted with a secant gear cut out;
- (ii) a departure indicator also runs off the fluxgate which dispensed entirely with the secant gear and gave northing and easting in nautical miles on the counters;
- (iii) an Admiralty pattern Gyro which was used as a very accurate direction indicator

Part IX is devoted to safety equipment and emergency rations.

Part X will be the medical report, together with a discussion of existing data on Arctic and long distance flights.

Part XI will round off the picture by giving an historical summary of polar exploration, with especial emphasis on the Arctic flights attempted. In this connection it should be noted that contrary to the ideas expressed in the popular press, the longest polar flight is not this mission of Aries, but Gromov's, of the U.S.S.R., which lasted 62 hrs and represented 7,150 miles flying in a single engined aircraft. A bibliography of polar exploration will be included.

November 6, 1945

Title: Arctic Aviation Development Program for the United States Recommended by the Standing Subcommittee on the ARCTIC.

* * * * *

(d) Region west of Grant's Land. The region north of Prince Patrick Island and west of Grant's Land is largely unexplored, but several Arctic authorities believe that if any undiscovered islands exist north of Canada they lie in this area. Sir Hubert Wilkins, in searching by air for Levanevsky in March, 1937, reported "ice islands" about 300 miles northwest of Prince Patrick Island and "paleocrystic ice" at about latitude 84°, longitude 130°, with a lead 150 miles long in the ice, as evidence of nearby land. Reconnaissance flights from Alaska to these regions could doubtless settle the question.

A primary weather station on any newly discovered island in this vicinity would be a valuable source of information because of its proximity to the North Pole and it would serve as a communication point for trans-polar flights. It would, however, be very difficult to establish and maintain. Surface vessels have never reached this area and aircraft would have to fly comparatively long distances. Employment of gliders to establish and service the base would be desirable.

The sovereignty of newly discovered land in this area would require careful consideration by the State Department. Mr. Stewart, on June 10, 1925, in speaking before the Canadian House of Commons, definitely and officially stated the Canadian claims to include everything, known and unknown, west of the Davis Strait - Baffin Bay - Smith Sound - Robeson Channel - 60th Meridian, east of the meridian that divides Alaska from Canada (141°W), and north of the Canadian mainland up to the Pole. The U. S. may not have recognized these claims.

(e) Region northwest of Pt. Barrow or Wrangel Island. The ocean area between Wrangel Island and the northwest coast of Alaska has not been fully explored. Charts show at least one shoal and depths ranging from 50 ft. to 250 ft. As it is quite possible that some small islands exist in this part of the Arctic Ocean, confirmatory airplane reconnaissance flights should be made over the triangular area defined by Pt. Barrow, a point at Lat. 74½°N, Long. 170°W, and Herald Shoals at Lat. 70°10'N, Long. 171'W. Very deep water (10,000 to over 15,000 ft. in depth) exists to the north of this area. Observations on trans-polar flights indicate that islands are not likely to be found within the United States sector of the Arctic Ocean outside the area outlined above. If land is found, a primary weather and magnetic station thereon would fill a vital need.

THIS PAGE IS UNCALSSIFIED

The USSR has maintained a colony on Wrangel Island since about 1926 and occasionally surface observations have been received by radio in recent years. Reports from this island, or any station northwest of Alaska, would be valuable.

The question of sovereignty should first be clarified. In 1916 Russia notified the governments of Great Britain, France, and the United States, and doubtless other countries, that it considered Wrangel Island, among others, as forming an integral part of the Russian Empire. A leading authority summed up the question by saying: "A Russian heard of it in 1824 but never saw it; an Englishman saw it in 1849 but never landed on it; and an American landed on it in 1881 and claimed it for the United States". It is not clear whether England or the United States has recognized Soviet sovereignty.

Should the United States recognize the Russian claim to this island, it is possible that the government of the USSR might be interested in establishing a primary weather station under one of the cooperative plans outlined in paragraph 10, above. Because of ice conditions, the island is not easily reached by boat and air service would be desirable.

(f) Thule or Etah, Greenland. There are small settlements at these points in Greenland. Arrangements could probably be made with the Government of Denmark for the establishment of a primary weather and magnetic station under one of the plans suggested in paragraph 10, above. Either station could be serviced by boat once a year.

(g) Spitzbergen, Norway. A meteorological station has been operated in the Archipelago of Spitzbergen at various times during World War II by the Norwegians, the Germans, the British and again by the Norwegians. It is a valuable source of meteorological information for aircraft operating over the North Atlantic. In the Spitzbergen treaty signed at Paris on February 9, 1920, provision was made in Article 5, as follows:

> "The High Contracting Parties recognize the utility of establishing an international meteorological station in the territories specified in Article 1, the organization of which shall form the subject of a subsequent Convention."
>
> "Conventions shall also be concluded, laying down the conditions under which scientific investigations may be conducted in the said territories." (There is no record of any subsequent conventions having been concluded on the subjects mentioned in Article 5).

Steps could be initiated by the State Department, pursuant to the provisions of this treaty, for the establishment of a primary weather and magnetic station. It is possible that the Provisional International

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

Civil Aviation Organization is the proper body to conclude the "convention" referred to in the treaty.

(h) Prince Patrick Island, Canada. A station on this desolate, bleak and unoccupied island would not be needed unless it was found impossible to establish a primary weather station west of Grant's Land. Arrangements could probably be made with Canada for the establishment of a station there by the United States. It would be very difficult to establish and maintain because ships can reach it only every few years. Servicing by aircraft would be required.

(i) and (j) Clyde River, Baffin Island, Canada, and Churchill, Canada. It is believed that suitable arrangements under one of the methods proposed in para. 10 (I, II, III, IV) could be made with the Canadian Government to establish primary magnetic stations at these existing weather stations. A primary magnetic station at Churchill will not be necessary if one is established at Baker Lake, site "(b)" listed in para. 9.

****

RECOMMENDATIONS

****

V. Weather Station on possible Undiscovered Land in Canadian Quadrant. (Discussion, par. 11 d and 16.)

It is recommended that the ACC ask the State Department whether reported Canadian claims of sovereignty over all known islands and lands that may be discovered in the sector west of Greenland and east of meridian 141 W, northward to the pole, have been officially asserted by that government and, if so, whether the official position of the United States would be to support any claims by this country if land is discovered and occupied by the United States west of Grant's Land, site "(d)" of recommendation #1.

If it is the policy of the United States to support such claims, it is recommended that the Army make flights over the unexplored area west and northwest of Grant's Land to determine whether (as many Arctic authorities believe) islands exist which might be claimed by the United States. In case new claimable land is found, it is recommended that the proper agencies of the Department of Commerce take action to establish a primary weather and magnetic station.

VI. Air Reconnaissance for Undiscovered Land in U.S. Quadrant. (Discussion, par. 11 e and 16)

It is recommended that the Army Air Forces make flights as soon as practicable from Fairbanks over a triangular area defined by (a) Pt. Barrow, (b) Lat. 74-1/2°N, Long. 170°W, and Herald Shoals at Lat. 70° 10'N. Long. 171°W to determine whether there are small islands

THIS PAGE IS UNCALSSIFIED

northwest of Alaska, site "e" of recommendation #I, and if so to take photographs and determine their positions. It is recommended, in such case, that the proper agencies of the Department of Commerce take action to establish a primary weather and magnetic station.

VII. Wrangel Island. Weather and Magnetic Station.
(Discussion, par. II e.)

It is recommended that, should it be found through reconnaissance flights (recommendation #VI) that no islands exist northwest of Alaska which could be claimed by the United States, the Air Coordinating Committee ask the State Department whether there would be any objection to the Chief of the Weather Bureau initiating action to determine whether it would be possible for and agreeable to the USSR, with or without the assistance of the United States, to establish a primary weather and magnetic station on Wrangel Island (site "e" of recommendation #I) for exchange of reports with a communication station in Alaska.

VIII. Spitzbergen Weather Station. (Discussion par. IIg)

It is recommended that the State Department be requested to take action looking toward the establishment on the Archipelago of Spitzbergen, site "(g)" of recommendation #I, of a primary weather and magnetic station as contemplated by Article 5 of the Spitzbergen Treaty of February 9, 1920, or in other appropriate manner.

IX. Canadian Magnetic Stations. (Discussion, par. II i and j)

It is recommended that the Coast and Geodetic Survey of the Department of Commerce discuss informally with the Surveys and Engineering Branch of Canada the possibility of Canada establishing a permanent primary magnetic station at Clyde on the east coast of Baffin Island, and if a station is not established at Baker Lake, then a like station at Churchill on the West coast of Hudson Bay, sites "i" and "j" of recommendation #I.

NO. 1 AIR SUPPLY UNIT (RCAF)
USAAF DETACHMENT
OTTAWA, ONTARIO, CANADA

Exercise Musk-Ox
15 May 1946.

SUBJECT: Engineer Information obtained on Musk-Ox Routes.

TO: Commanding General, Army Air Forces, Washington, D. C.
Attn: Brig. Gen. Francis H. Griswold, Dep. Asst Chief of Air Staff

1. Pursuant to instructions contained in Ltr. Hqs, Army Air Forces dtd 14 Jan 46, the following information is offered on the Musk-Ox Expedition Routes. This report is offered separately, since the final report mentioned in basic correspondence is intended to cover only those topics set down by the War Department. This report is written in full coordination with the Royal Canadian Air Force and Royal Canadian Army.

2. Possible airfield sites and the list of existing possible airfield sites below, represents only those which were encountered in or near the route of the Musk-Ox Expedition. Many other sites, no doubt exist. It would not, however, have been practicable to have attempted to record any others while on this expedition. This list will cover a location beginning at Churchill, Manitoba and running north to Cambridge Bay, then in a west-south-west direction to Norman Wells, North West Territory and finally south to Edmonton, Alberta. (See attached Sketch).

a. Churchill, Manitoba: Former U. S. Army Base, built by U. S. Engineers. All information concerning this Base should be in Headquarters Army Air Forces.

b. Eskimo Point: Location, Lat. 61° 36' N; Long. 94° 34' W. Western shore of Hudson Bay, 180 miles south of Chesterfield, 200 miles north of Churchill.

(1) Descripttion: Airplane landing site located on 'Frozen Lake'. Safe ice from November 6 to May 10. Water open July 10 (earliest date) to October 15 (Latest date). Only obstructions are numerous wireless masts lying north and west. None higher than 50 feet. Refuelling arrangements for 87 Octane only, quantity unknown.

(2) Seaplane Base: In Bay, north of settlement, long runs dangerous due to reefs. Fair shelter from winds except East to North-East Winds. Heavy seas, September to October. Temporary mooring, 200 yards off shore from Hudson Bay Company. Good holding facilities adequate through medium of whaleboats, canoes, etc. All beaches, rock and gravel. Could be used for seaplanes but not desirable

(3) Weather: Prevailing wind in summer, Southeast; in winter, Northwest. Stormy periods of Northeast winds and heavy seas, September 15 to October 15. Fog, mid-July to mid-September. Fog averages one day out of five in this period.

THIS PAGE IS UNCALSSIFIED

Cont'd. Subj. Engineer Info obtained on Musk-Ox Exped. dtd 15 May 46.

c. Baker Lake: Location, Lat. 64° 17' 30"N; Long. 96° 2' W. Located 180 miles inland from Chesterfield.

1) Possible airplane landing site (undeveloped). The sloping lowland between the pass and the south of the Thelon River has a tundra and gravel surface. It is drained by several small streams about three feet across in the summer and is wet and marshy near the shore. The first sloping terrace of gravel, tundra and rock could be smoothed into a level area about one-half mile wide (East to West), and from one to three miles long. Dangerous rock hills are to thewest of this terrace.

2) Seaplane Base: Located 64°15' 30" N; 96°01' 50" W. Two miles from the mouth of the Tehlon River, good depth of water, no known shoals or reefs. No Buoys, good beaching on sandy beach also a small wooden wharf in front of RCMP Warehouse. Seaplanes in summer, ski-equipped planes could be operated on smooth ice in winter.

3) Weather: Prevailing wind, Northwest; occasional gales lasting several days, severe winters; average low - 60°F. Very little fog.

d. Cambridge Bay: Location, Lat. 69°10' N; Long. 104°48' W. Location of landing strip is on Bay between Cape Colborne and Finlayson Island. The Bay affords fairly good airplane landing base on ice but has no facilities. Summer is extremely short and offers no facilities for seaplane base.

1) Weather: Violent winds are common, extremely cold. Prevailing wind, Northwest.

e. Coppermine: Location, Lat. 67°50N; Long. 115°05' W - North of Coppermine River. Developed seaplane base on Coppermine River only, for small aircraft. No developed site on land, but aircraft can be landed on frozen Coppermine River about eight months of the year.

1) Weather: Prevailing winds, east and west. Visibility subject to ocean fog; extreme cold and considerable fog in July.

f. Port Radium: Location, Lat. 66°05' N; Long. 118° 01' W. On peninsula in Echo Bay, east side of Great Bear Lake.

1) Aircraft landed on ice in Bay; estimated thickness about eight feet. Very poor seaplane base in summer.

g. Norman Wells: Built by USAAF. Information concerning this Station should be on file at Headquarters, Army Air Forces.

h. Fort Wrigley: Location, Lat. 63° 16' N; Long. 123° 37' W. On West bank of MacKenzie River, just above junction of Wrigley and MacKenzie Rivers.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

Cont'd. Subj: Engineer Info obtained on Musk-Ox Exped. dtd 15 May 46.

1) Airplane landing site; one runway of compacted earth; 4500 feet by 250 feet. Rotating beacon. Direction 280° and 100°. Field operated for emergency use only, but affords a suitable site for development.

i. Fort Simpson: Built by U.S.A.A.F. for route from Edmonton to Aklavik. All information should be available at Headquarters, Army Air Forces.

j. Fort Laird: Location, Lat. 59° 31' N; Long. 126° 23' W.

1) Airplane landing site; one runway, 5000 feet by 150 feet, running parallell to Alkan Highway. Direction 100° and 280°. Gravel surface and operated for emergency use only but offers possibilities for development.

k. Fort Nelson: Established by U.S.A.A.F. All information concerning this Base should be on file with Headquarters, Army Air Forces

l. Prophet River: Location, Lat. 57° 58' N; Long. 122° 45' W; 177 miles north of Fort Saint John.

1) Airplane landing site; one runway 6000 feet by 150 feet; surface of stabilized gravel. Direction 010° and 190°. Rotating beacon. Power line obstruction, 2000 feet, not lighted. Operated for emergency use only, but has possibilities for development.

m. Sikinne River: Location, Lat. 57° 05' N; Long. 122° 34' W; 101 miles north of Fort Saint John.

1) Airplane landing site; one runway of stabilized gravel, 6000 feet by 150 feet. Direction 70° and 250°. Operated for emergency use only, but has possibilities for development.

n. Fort Saint John: Location, Lat. 56° 14' 30" N; Long. 120° 51' W; north side of Peace River.

1) Airplane landing sites; two asphalt runways, direction 20° and 200°; 6700 feet by 200 feet and the other, direction 110° and 290°; 6700 feet by 200 feet. Also has one dirt runway, 3500 feet by 75 feet, running in a direction of 60° and 240°. Base has rotating beacon and approach light to runways. One hangar, set up only for minor maintenance and repair.

o. Dawson Creek: Location, Lat. 55° 45' N; Long. 120° 15' W, on Dawson Creek, four miles northwest of Peace Coupe.

1) Airplane landing site; one asphalt runway, 6200 feet by 150 feet. Direction 60° and 240°. Presently operated for emergency use only. Has good possibilities for development.

p. Grand Prairie: Location, Lat. 55° 10' N; Long. 118° 48' W.

THIS PAGE IS UNCALSSIFIED

Cont'd. Subj: Engineer Information obtained on Musk-Ox Exped. dtd 15 May 46.

1) Airplane landing site; two asphalt runways, direction 60° and 240°, 6200 feet by 200 feet, and the other, direction 110° and 290°, 6600 feet by 200 feet. Base is operated by Royal Canadian Air Force and has one hangar which performs minor Maintenance only. Useable all season.

q. Edmonton, Alberta: Base constructed by U. S. A.A.F. and being operated at present by Air Transport Command.

3. Construction procedures: Practicability of snowlanding strips:

a. Hard packed snow offers an excellent landing site for aircraft regardless of size. The snow itself, affords excellent traction for rolling and braking of aircraft wheels. It has, however, a number of disadvantages. It has to be rolled daily and during heavy snow periods, sometimes several times a day. No special equipment is necessary for this rolling, just ordinary Caterpillar Tractors dragging heavy weights or rollers. On the strips used during this exercise, the equipment was usually improvised. Another disadvantage of the snow landing strip, is the spring thaw or any short period of thaw during the winter. When this occurs, this type of landing site is absolutely useless, and may even be considered dangerous for heavy aircraft.

b. Ice and snow landing strips on lakes and rivers: The use of frozen lakes and rivers for landing aircraft affords a good temporary landing site and is quite easy to set up and maintain. It is, however, imperative that a close check be kept of the conditions of the ice. Changing temperatures, of course, effect the thickness and the strength of the ice. The average thickness of the ice in the lakes and rivers used on this Exercise would be estimated at about six feet. The heaviest aircraft used on this type landing, was a loaded U. S. C-46 type aircraft, normally, however, the C-47 type aircraft was used. There was, of course, no way of determining the maximum weight, this thickness of ice could support.

c. Practicability of constructing permanent air bases: In the arctic area and the close sub-arctic area lying inside the treeline, there seems to be no apparent reason why permanent airfield sites could not be established if the necessity arose. That portion lying above the treeline, commonly known as the "Barrenlands", affords a few areas only, where construction of permanent sites would be advisable. The greater portion of the ground in this area is permanently frozen. The action of this ground, due to changing temperatures in winter and the thaw during the summer months, would naturally present quite a construction problem.

1) Special Problems involved:

a) Clearing: This question must be answered after considering two different areas. In that area commonly known as the "Barrenlands" there would be little or no problem in clearing. In that portion of

THIS PAGE IS UNCALSSIFIED

the Arctic and sub- Arctic that lies within the treeline, the problem is somewhat different. The area is heavily wooded, but little or no undergrowth exists; the soil in these areas is Muskeg. The problems of clearing in this area are comparable to those encountered in the timber areas of the Northwestern United States.

b) Stripping surface of snow and ice: Again this question covers large areas in which terrain conditions vary, therefore the recommendation offered here must be considered as general, for conditions of the whole arctic region. In construction of permanent airfield sites, it is recommended that the runways, hangars, etc., be constructed on a foundation, the base of which would be under the frostline in that area. This will necessitate a foundation in some areas of sixty (60) feet in depth. After the general area has been selected for an airfield site, a thorough reconnaissance should be made by experienced engineer personnel to determine the exact location. This reconnaissance should determine the following:

(1 Suitability of ground for construction.

2. Availability of natural materials, i.e., rock, timber, gravel beds, etc.

3. Water supply and transportation factors.

4. Natural protection features.

5. Existence of certain minerals or magnetic fields which seriously affect the operation of electronic equipment.

c) Paving of surface: In most areas, concrete would seem to be the most desirable type of pavement, especially in the sub-Arctic areas. However, well drained runways of a dirt-gravel combination would be suitable for the operations of light and medium weight aircraft.

d). Maintenance of surface: In maintaining permanent runway sites, two methods may be employed:

1. Compaction of snow and ice on runways by rolling, grading, etc.

2. Removal of snow and ice on runway by constant strippin .

Of the two methods, the latter is strongly recommended for operational use of U. S. Army aircraft. The reason for this recommendation, is that during the period of thaw, the compacted snow runways are imobilized for periods as long as two or three weeks and are some-

THIS PAGE IS UNCALSSIFIED

times hazardous for operation of heavy aircraft for much longer periods.

d. Equipment: With proper winterization, it is believed that present engineering equipment would be suitable for operations in the arctic area. It is recommended, that consideration be given to the development of heavy equipment that may be airborne, since no railheads exist in this area.

e. Fog Dispersal apparatus: For winter operations, it is not estimated that this type of equipment would be required in arctic areas, however, it was reported from reliable sources, that a fog dispersal apparatus would be absolutely essential for summer operation in some areas. It is suggested that tests be conducted to determine the practicability of using fog dispersal equipment to combat the blowing snow condition which often exists in the arctic area. This condition is considered a landing hazard and ~~xx~~ any equipment that could be designed to minimize this danger, would be highly beneficial.

f. Utilities:

1) Water storage and distribution: It is estimated that present U. S. Army equipment for water storage could be utilized. Consideration, however, must be given to the fact that the water must be protected from freezing and contamination, and that pipes may be laid above the ground and insulated. The water storage plan utilized in construction of the U. S. Army Base at Churchill, Manitoba, is cited as an example.

2) Heating: In northern arctic areas, there is no natural fuel. The use of approved types of U. S. Army oil heaters have proven satisfactory, in the past. It is estimated that any type of distolate heaters approved by the Army would be suitable in this area.

3) Electric Power and Lighting: In the arctic area, operating organizations must depend entirely on portable power and lighting units. It is estimated as in the present organization, portable lighting equipment would be adequate for field organizations operating in this region.

4) Sewage Disposal: This is one of the most serious problems in the arctic area as concerns a large organization. Chemical sewage equipment utilized on this exercise was not entirely satisfactory. This may be partically attributed to improper maintenance of the equipment. It is believed that a thorough study of this problem should be made by experienced medical personnel to conclude a practicable solution.

5) Gasoline and Oil Storage: From the experience gained on this Expedition, it is estimated that oil and fuel dumps must be maintained above ground in order to insure proper drainage of ice and water. This will also facilitate installation and maintenance of equipment.

g. Anticipated Requirements: It is estimated that for operations in

in arctic areas, the following types of equipment must be developed:

1) Nose Hangar (heated). The present type Nose Hangar is completely inadequate for this area. Due to the fact that personnel efficiency is greatly impaired in low temperatures areas, it is imperative that comfortable working conditions be provided.

2) Hangars must be properly heated at all times to insure maximum personnel efficiency.

3) Buildings of semi-permanent installation, it is recommended that the Jamesway or Quonset type huts be utilized. If insulated and heated properly, it is believed that this type building could be utilized satisfactorily until some type of permanent construction could be designed or developed.

4. The information contained in the above paragraphs, is not intended to be conclusive, but is offered on the basis of being as comprehensive as possible to obtain, while on this expedition. It is, therefore, suggested that a detailed field study be given to these problems by experienced engineering personnel.

NO. 1 AIR SUPPLY UNIT (RCAF)
EXCURSION MUSK-OX
RCAF STATION, ROCKCLIFFE

Ottawa, Ontario.
17 May 1946

SUBJECT: Report on Musk-Ox Expedition

TO: Colonel Norman B. Edwards, Senior WD Observer.

The following report is offered to cover those questions of the War Department report, covering air participation on the Musk-Ox Expedition. The answers will appear in their numerical sequence as assigned to this Officer.

* * * * * * *

6. EMERGENCY STRIPS : The terrain in that area known as the Barrenlands would be suitable for the construction of emergency landing sites during the winter months. This period varies, but can be estimated from about 1 November to 1 May of each year. That area lying within the "Treeline" will afford emergency landing sites during the winter period, but only on lakes, rivers and open areas. All open areas should be thoroughly reconnoittered on the ground before any attempt is made to utilize them for landing areas (in this area behind the "Treeline") due to the heavy snows. Many open areas and lakes in this area, although frozen, have landing obstackes that are, normally, completely covered with the heavy snow.

7. FROZEN LAKES FOR LANDING SITES: Yes, the frozen lakes would be suitable for landing sites (temporary) during the winter period. Many of these lakes were utilized for this purpose on this Exercise.

10. AIRCRAFT: Gyro or Helicopter aircraft would be ideal for use in this terrain especially in the Barrenlands. These aircraft, However, would have to be properly winterized and the range would have to be extended considerably. In order to operate efficiently, aircraft should have a minimum range of a thousand miles in the arctic area.

13. REPORT ON AIR SUPPLY.

a. Training: A combined Army and Air Force training period was held at the RCAF Station at Gimli, Manitoba for three weeks prior to the movement of all members of the Exercise to Churchill. At this time, Army personnel detailed to the Air Supply Unit were instructed in the technique of parachute packing, the preparation of material for dropping, aircraft drill, and dropping technique. During this time, the Air Supply personnel learned to work as a team and the flight personnel determined the best dropping procedures. This training period at Gimli was further implimented by six weeks further training at Churchill, Manitoba.

b. Aerial Delivery: All aerial deliveries were made with standard 24 ft. Nylon or Silk parachutes, with the exception of a very small percentage which

THIS PAGE IS UNCALSSIFIED

were made using an 18 ft. cotton parachute. These parachutes were static line actuated with the pilot chute removed. An analysis of the methods used and amounts delivered by this unit are as follows:

1) Parachute - 199,609 pounds delivered. Losses were 3.9%. A total of 1232 parachutes of all types, were used.

2) Glider operations, approximately, twenty-two thousand pounds were delivered by Glider. These figures, of course, do not include the workshop Glider which was used on three operations during the Exercise.

3) Air landing - Approximately 124,000 pounds was delivered directly to the Moving Force or to advanced bases by aircraft landing.

c. Summary: Air Supply was available to the Moving Force at all times. The Air Supply Unit consisted of more aircraft and Gliders than were actually needed for this operation. The greater majority of air drops were carried out as planned and there were no instances during the Exercise that the Moving Force requested available supplies that were not furnished on schedule.

14. COMMAND: Command and operational control of the joint forces, Ground and Air in the field, was exercised by the completely impractical system of a separate command for each force. At no time on this Expedition, was there a task force commander appointed. The Air Commander and the Ground Commander were completely separate. The defects of this system are obvious and manifested themselves at many points in the Exercise. It is recommended that on any future operations of this type involving United States forces, on overall command be set up prior to the starting of the training period for the operations.

15. EQUIPMENT UTILIZED: The following is a report on the operational adequacy of the AAF equipment utilized on this Exercise:

a. C-47 type Aircraft: This aircraft operated in the usual excellent manner and for the parachute re-supply and Glider pick-up, became the backbone of the Air Unit. Several defects, however, became noticeable in this aircraft as follows:

1) The range of the C-47 type aircraft for this area is inadequate. Several different types of cabin tanks were utilized with the same overall result - serious reduction of the aircraft payload.

2) The maximum load that the C-47 carries is not sufficient, when both the ground and air unit are completely dependent on Air Supply. This holds true when the aircraft is operating without cabin tanks and of course, with cabin tanks, this type aircraft is little better than useless for long range operation.

3) Hydraulic system in all parts of the aircraft does not operate at full efficiency in extreme temperatures.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

b. <u>CG-4A Glider:</u> This aircraft was found to be the most satisfactory of the powerless aircraft utilized on this exercise. Its short run take-off characteristics and slow landing speeds render it particularly desirable for over snow and ice operation. At the start of the training period of the Exercise, the RCAF insisted on placing several modification on this aircraft. This action delayed the use of gliders until after the training period was completed. This caused considerable delay in the employment of these aircraft, since the coldweather training of the personnel concerned had to be accomplished after the start of the Exercise. Of the modifications themselves, the majority proved unnecessary. In the course of the Exercise, five CG-4A gliders were utilized, three with Canadian modification and two without. Those without modifications proved the most successful. There are various modifications that could be placed on the CG-4A to improve its operating efficiency in both light and heavy snow. The most important of these is on the nose section, since that is the only part of the airframe of the glider effected by the snow conditions. The Griswold Nose should be used in all cases. The Corey skid runners should be extended in both directions about eight inches and should be solid across instead of the present separate skids. This could be accomplished by installing six additional skids to the present Corey skid arrangement. The slow landing speed of the CG-4A is the best characteristic for use in snow areas.

c. <u>CG-15A Glider:</u> This aircraft was utilized to a limited extent during this Exercise and with the exception of one occasion, its use was successful. The unsuccessful occasion being the first test run for the glider training period. During this test, this aircraft suffered damage to the nose section. This damage was repaired and the nose section strengthened by placing an aluminum cover over it. The necessary time for this repair, however, added to the time employed to make the long trip from Ottawa to Norman Wells, NWT, delayed its return to the Exercise until about 5 April. This glider was later landed at Ft. Norman in deep snow and a successful pick-up was executed. It is recommended that this aluminum nose be provided as a permanent modification for coldweather operations of this aircraft.

d. <u>Model 80 Pick-up Gear:</u> Three C-47 aircraft equipped with the Model 80 Pick-up Gear were utilized by the Air Unit on this Expedition. Although they arrived in Canada prior to the start of the training period for the personnel of the Air Supply Unit, their use on the Exercise was delayed for over two months while coldweather testing was conducted at Ottawa. The temperature at Ottawa during the period that these tests were conducted was such that the results obtained are of little value to the AAF. This delay was advantageous to the AAF Detachment however, as the majority of the personnel detailed to this assignment by IX Troop Carrier Command were not experienced Glider and pick-up personnel. It is believed that more experienced personnel were available within that Command for this assignment.

The pick-up gear was first used at Churchill, Manitoba on 4 Mar 46, in a series of tests conducted by the Test and Development Section (RCAF). The results of these tests were satisfactory. The use of this equipment on the remaining portions of the Exercise under varying conditions resulted as follows:

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

1) In ice and hard packed snow, it is believed that the gear is satisfactory in its present design.

2) For use in soft, deep snow, this pick-up gear as used on this Exercise, did not prove adequate. This may have been due partially to the fact that the pick-up operator was unable to operate the braking system on the winch during pick-ups because of the close installation of the cabin tanks. Difficulties experienced may also have been caused by the extreme amount of drag created by present landing gear of the CG-4A in deep snow. Although, in that portion of the Exercise where deep, soft snow and mud were encountered, each pick-up was ultimately successful, though serious damage to the pick-up gear resulted.

3) For use in arctic areas, the present "safety link" should be redesigned. It was apparent on this Exercise, thatin extremely low temperatures, the strength of the Nylon safety link became greater than that of the cable.

e. Conveyor Belt Discharger: One U. S. C-47 Aircraft used on the Expedition was equipped with a Douglas (belt type) power operated conveyor. This equipment as designed, did not prove satisfactory on the tests at Churchill, prior to the starting of the Exercise. In these tests, the conveyor was required to discharge ten, fifty-five(55) gallon drums of gasoline. It was obvious in these tests that the idler rollers could not take the strain of these heavy weights. This equipment was therefore modified as follows:

The turning mechanism was completely eliminated and a sheet metal plate substituted. It was also necessary to increase the number of belt idler rollers. After these modifications were completed, this equipment proved highly satisfactory and the RCAF are now considering adoption of this type conveyors as modified above.

The weight of this mechanism is approximately five hundred (500) lbs. The weight of the conveyor presently used by the RCAF is approximately 370 lbs. It must be noted, however, that a four man crew is required to operate this Canadian type conveyor, thus reducing the payload of the aircraft, seven hundred lbs. Use of the Douglas powered conveyor as compared to the Canadian roller conveyor would result in an increase in payload of about 500 lbs.

16. FLYING CONDITIONS ENCOUNTERED: Flying in northern latitudes in winter months is relatively the same as flying any other part of the world, with the exception of the complete absence of Navigational aids. The weather in this areax is, however, somewhat different than that encountered in lower latitudes. In that area known as the Barrenlands, the prevailing windsare Northwest with an average velocity of about 25 MPH. During the course of this Exercise, winds velocities were reported as high as 75 MPH. One of the results of this wind condition is blowing snow. This condition often rises to as high as a thousand feet above theterrain, and is a serious hazard to aircraft landings and take-offs. There was negligible iceing if aircraft in the northern latitudes during the coldest months. The general conclusions reached by personnel on this Exercise, was that prevailing weather conditions are more suitable for flying in this region than in many portions of the United States.

THIS PAGE IS UNCALSSIFIED

18. EFFICIENCY OF AIR FORCE PERSONNEL IN NORTHERN LATITUDES:

a. Air Crews: No marked decrease of efficiency of flight personnel was noted while on this Exercise. It was interesting to note that the efficiency of some flight personnel increased with added responsibilities. It is believed that the maintenance of efficiency of the flight personnel was due partially to the fact that their working conditions remained relatively unchanged.

b. Ground Crews: It must be noted that both the efficiency and sense of responsibility of ground personnel working out in the open, decreased at an alarming rate under extremely cold weather conditions.

20. CONSTRUCTING AND OPERATING FROM EMERGENCY AIRDROMES: In extreme Northern latitudes, the problems of constructing and operating from emergency airdromes, during the winter months, are relatively simple. Emergency landing sites may be constructed in a short period of time, landing airborne engineer equipment by Glider or ski-equipped aircraft. This type of a landing site, with the excellent traction it affords to wheeled aircraft may be constructed in almost any part of the arctic area. On this Exercise, this procedure was followed for the landing areas at Baker Lake, Cambridge Bay and Port Radium. These strips were used by fully loaded C-47 Aircraft.

21. MASS SUPPLY OF GROUND FORCES: From the experience gained on this Exercise, it is apparent that a mass supply of ground forces, regardless of size, is perfectly feasible. This statement is made on the basis that such an operation would be made using present standard equipment, winterized and properly coordinated.

22. LIMITING FACTORS ON AIRCRAFT: There is no apparent reason why large numbers of both light and heavy aircraft cannot be operated in arctic regions, to whatever extent desired by higher authority.

23. Limiting factors on SUPPLY OF GROUND FORCES: From the experience gained on this Exercise, it is believed that the only limiting factor on re-supply of mobile troops on winter operation, is the physical characteristics of the equipment that would be needed by such troops.

62. SUPPLIES FROM BASES: At the Churchill Base, all supplies were brought in by rail. At all other bases, due to the absence of a railhead, supplies were delivered by air. There are two exceptions to this statement, as follows:

a. At Yellowknife, NWT, the initial stocks of fuel were brought in by ~~wx~~ winter tractor train. Re-supply of this fuel, however, was accomplished by air from Norman Wells, NWT.

b. At Norman Wells, all fuel and transportation was purchased from the Imperial Oil Refinery Company at that location.

63. AIR SUPPLY METHOD: Rations, clothing and fuel were packaged and supplied as follows:

a. Rations: The greater portion of the rations used on this Exercise were the U.S. 10-in-1 Ration. This ration does not require any further packing for parachute dropping.

b. Clothing: Numerous drops were made for clothing by using both the parachute and free fall method. On the hard frozen ground in the Barrenland, the parachute method was found to be most satisfactory.

c. Fuel: Fuel was dropped to the Moving Force in a fifty-five (55) gallon metal container, by using two, twenty-four foot parachutes. This container and its fuel weighted approximately 450 pounds.

64. AIR RE-SUPPLY: Air re-supply was accomplished by the following methods:

a. By parachute from C-47 aircraft. The majority of supply was made by using this method.

b. C-64 Aircraft on skiis, landing beside the Moving Force on the trail.

c. By CG-4A and CG-15A Glider, landing on both prepared and unprepared landing strips.

d. By air-landing C-46 and C-47 aircraft on prepared landing strips.

65. COMMENTS AND OBSERVATIONS: This exercise afforded an excellent opportunity to evaluate the desirability of the use of glider for re-supply in the arctic region, however, the greater portion of supplies delivered to the Moving Force were by parachute. The use of Gliders by the RCAF was only considered when all other methods at their disposal were impractical. This may be attributed to the fact that Gliders were introduced on the Exercise after plans had already been made by the RCAF for other types of re-supply. Responsible personnel in the RCAF have had little or no experience with this type aircraft and its diversified uses for air supply, and consequently were reluctant to use it at the start of the Exercise. In all operations where the gliders were used, they were successful.

Prior to the departure of the Moving Force, a ten man party was sent out overland, with ~~xxxxx~~ Caterpillar Tractors and supplies from ~~t~~ Churchill to Baker Lake, a distance of about four hundred (400) miles. The purpose of this Expedition was to prepare and maintain an advanced air strip at Baker Lake for the use in air landing supplies to the Moving Force on its arrival at that destination. This operation required about three weeks to complete and could have been done in a matter of hours had gliders and airborne engineer equipment been utilized This is only one of the many instances where the use of glider aircraft would have been more practical than the types of operation performed.

As the Exercise neared completion, the Gliders had definitely proven their effectiveness in this type of operations, and were not viewed with the original skepticism as when first introduced.

THIS PAGE IS UNCALSSIFIED

SECRET

It is not believed that any further knowledge of the methods of parachute re-supply was gained by Army Air Force Observers on this Exercise. Methods employed by RCAF in this type operation are very similar to the standard operating procedures of units of the U. S. Army Air Forces.

COMPARISON OF EQUIPMENT.

a. Clothing (flying): Flying clothing worn by RCAF personnel is relatively the same as that worn by AAF personnel with the following exceptions:

The flying Jacket (heavy) and the flying breeches (heavy) of the RCAF, are made of a considerably heavier material than similar pieces of American equipment. It is believed that the USAAF A-9 breeches are adequate in their present design. The Canadian heavy flying Jacket, however, has certain protective features that would be highly desirable if incorporated into the U. S. A-9 Jacket.

It is believed that the present U.S. Winter flying boots although very similar to the Canadian boots, are unsuitable for arctic operations.

b. Equipment (aircraft): With the exception of a few minor modifications, all aircraft utilized on this Exercise were standard U. S. Army types. The maintenance equipment, spare parts, etc., utilized were also U. S. Army type.

c. Rations: The types of emergency rations utilized on this Exercise were the Canadian Army Monopak (arctic) and the U.S. 10-in-1. A more complete discussion of these rations has been covered earlier in this report.

d. Fuel (aircraft): Aircraft & fuel used by the air unit on this Exercise conforms to the same specification as that used by the U.S. Army Air Forces. This fuel was 100 Octane for heavy aircraft and 87 Octane for light aircraft.

NAVY DEPARTMENT

INTELLIGENCE REPORT

B.I.D. 4604.0100

Serial 176-47 Monograph Index Guide No. 601-130

From U. S. Naval Attache at Moscow, USSR Date 18 July 1947

Source La Metropole (Belgina) of 22 May 1947 Evaluation B-2

Subject USSR - Coastal Terrain & Waters - Northern Sea Route

SUMMARY: This account of the Northern Sea Route contains some statistical and geographical information which may not be duplicated elsewhere in the Navy's files. It is, in any event, a well-ordered and interesting presentation of development of the Route.

"THE PUSH TOWARDS THE ARCTIC"

Russian Plans for development of the Northern Sea Route

In 1938 Molotov defined the Soviet aims in the north: "Transform the maritime route of the north into an artery that will assure a regular liaison with the Far East".

Thus he explained a posteriori the efforts of the Soviets since 1920. In order to fully understand the importance which the Soviets attach to the carrying out of this objective one need only measure distances on the map. From Archangel to Vladivostok, there is a distance of 6,345 miles through Soviet territorial waters, whereas from Odessa to Vladivostok a ship must travel over 9,300 miles, entering foreign waters. These plain facts explain the gigantic effort and persevering expeditions from a scientific as well as an economic point of view.

The Two Sectors of the Route

This transformation was accomplished in two stages. First of all, navigation had to be established in the western sector of the polar seas. Since 1920, expeditions on the Kara began with a regular summer service between the European coast of USSR and the mouth of the Obi and Yenisei. In 1930, a convoy of 50 small cargo ships coming from England and Germany, escorted by icebreakers, reached the estuary of the Yenisei, bringing

THIS PAGE IS UNCALSSIFIED

20,000 tons of merchandise and loading 127,000 for a return trip. It was, however, only since 1932 that the Administration of the Northern Sea Route considered these expeditions as operations. This change in name signifies that the Kara Sea could from then on be counted among the seas having permanent regular sea service.

Having accomplished this first stage, the conquest of the eastern sector was begun. In 1932, Otto Schmidt, on the icebreaker "SIBINYAKOV" succeeded in making the voyage from Archangel to the Pacific in a single season. In 1933, an expedition led by Lavrov, consisting of three ships, left Archangel and proved that it was possible to transport merchandise as far as the mouth of the Lena. The same year, this enthusiasm was lost due to the catastrophe of the "CHELYUSKIN" which left Murmansk and was crushed by ice just as it was to enter the Pacific. But soon, hope was revived by the voyage of the icebreaker "LITKE", which, in 1934, went from Vladivostok to Murmansk in a single season. An icebreaker service was organized with the result that in 1934 not a single ship was icebound.

Since 1935, the Northern Sea Route has been navigable artery in its entire length. A glance at statistics of the tonnage transported is convincing:

Progress of Shipping

Year	Transported Tonnage	Number of Ships
1933	136,000 tons	
1934	156,000 tons	
1935	230,000 tons	100
1936	271,000 tons	160
1937	350,000 tons	
1940	500,000 tons	

From 1940 to 1945 the transported tonnage increased by 198 per cent. But this included war materials furnished by the Allies.

Technical Organization

It may be of interest to study the substructure of the Arctic maritime services.

In 1938, 90 permanent polar stations, transmitting daily meteorological information, helped in correction of weather prediction charts, as well as conditions of the ice at least along the seacoast. The stations were established on the estuaries of Siberien rivers for studying hydrographic conditions. Over and above this, about ten ships, carrying specialists from the Arctic Institute made a tour every summer.

THIS PAGE IS UNCALSSIFIED

Next to these stations which are considered secondary bases, there exist coastal bases, equipped with ultra-modern equipment and linked during all seasons with the interior by means of air routes. The principal ones are; the two radio beacons of Nelyostrov and Dickson, and the twelve large radio transmitting stations of Vaigach Island, of Novaya Semlya (2), of Dickson, of Cape Chelysukin, of the mouth of the Lena (2), of the Liakhov Island, of Wrangel Island, and the three transmitters installed on the coast of Chukchi Peninsula.

As a ship must not only take on provisions but also fuel, ports must be established wjere ships may visit and unload and take on merchandise as well. The effort to exploit petroleum and coal deposits in the Bhatanga Valley, coal in the Lena region; and coal and oil in the Chukchi Peninsula greatly helps to avoid costly transport of fuel and oil from the interior of Siberia. In 1938, there were the following ports which possessed a jetty and a dock: Nezen, Naryan-Mar, Nory Port, Ust-Yeniseisk and Igarka, Dickson Island (which also serves as a depot for coal which is brought down the Yenisei river), Ticumisti, Dulkur, Tiksi, Arbarchik and Cape Providence.

The Fleet Placed in Operation

All the above mentioned constitute fixed elements in the Northern Sea Route. Now a word on the mobile elements, without which there would be no Northern Sea Route. This fleet is composed of icebreakers, and planes. While the planes scout and report ice and weather conditions, the icebreakers make a channel for ships carrying cargo and at the same time the icebreakers patrol the sea lanes.

The four divisions of the Northern Sea Route have each their own fleet which maintains security in the following areas: Murmansk-Dickson Island, Dickson Island-Bulkur, Bulkur-Sukharnoye, Sukharnoye-Anadyr.

Until 1937, the icebreaker fleet consisted only of ships built at the time of the Tsars.

Icebreaker	Year	H.P.	Tons	Capacity
ERMAK	1890	9,500	8,250	2,650
LITKE	1909	7,900	3,028	750
KRASSIN	1917	10,000	8,750	2,665
LENIN	1917	7,980	6,000	1,200
V. RUSANOV	1908	2,200	2,600	292
A. SIBIRIAKOV	1909	2,000	2,600	292
G. SEDOV	1909	2,360	3,056	285
NALYGUINE	1912	2,800	3,200	300
SADKO	1913	3,500	3,350	250

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

Among the icebreakers, we must distinguish the "LITKE" of the "ice-cutting" type, which cuts ince which si a bit thick and then plows through it making a channel. The other icebreakers are of the "ice-crushing" type. The latter are so large that their size permits them to break or crush the ice without cutting it first. These crushers maintain clear channels in the more i,portant ice fields. During the war the Russians maintained a fleet of icebreakers which operated winter as well as summer thus providing uninterrupted service.

Little is known on new construction since 1937. In 1936 there were under construction at Leningrad and Nikolaiev, four icebreakers of the KRASSIN type: while at the Marti Shipbuilding Yards, two ice-crushers of the SEVRORPUT class capable of transporting passengers as well as greight. These ships have a displacement of 2,410 tons and the motive power of 12,000 H. P. Their names are KIROV and KUISYSNEV. In the Baltic shipbuilding yards, two giant icebreakers, the STALIN and the MOLOTOV were under construction. All of these ships are now on active service.

Penetration into the Apctic

The merchant ships are really the cutting stone in the push to the Arctic. Geographically they comprise the Northern Sea Route. In fact, it is thanks to them only, that the exploitation of natural resources in Siberia can be considered a successful enterprise. The transportation problem in the North however cannot depend entirely on sea routes. Railway and air routês must also be established in order to link them all together and increase the importance of the North.

TREATISE ON GREENLAND

-637-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

GEOGRAPHY and TOPOGRAPHY

Greenland extends from Capt Farewell, the southern tip in latitude 59° 46' N. to Capt Morris Jessup, latitude 83° 39' N., a stretch of more than 1400 miles. In its broadest part, the country is somewhat over 600 miles wide. It is the largest island in the world. It covers 830,000 sq. miles and is about three times the size of our state of Texas. However, over 4/5ths of the island or roughly 700,000 sq. miles is covered by a great glacier which is known as the inland ice cap. Only the periphery of the island is ice free and inhabitable. This ice free belt averages about fifty miles in depth though in places is as deep as 100 miles. Steep, jagged, treeless mountain peaks extend right down to the sea. Numerous kerries dot the coastal waters, and unnumberable fjords cut inland between the rocky costal peaks. Tongues from the glacier or inland ice cap extend down into many of these fjords where they belch forth the ice bergs that float down to the North Atlantic sea lanes. Small tundra covered valleys are found at the heads of many of the fjords. When viewed from the air innumberable lakes are seen to literally dot the countryside. The rocky landscape is cold, bleak, and massive. There is much beauty here. The beauty of a wild and rugged land! It is not without color for in the summer many brilliant flowers grow rampant in the hills and valleys. The sky is gorgeous, exhibiting almost every day an endless panorama of vary colored scenes. Never have

THIS PAGE IS DECLASSIFIED IAW EO 13526

I seen so many colors in the sky as almost any day I can view from my window.

POPULATION and INDUSTRY

The population of Greenland is remarkably small amounting to only about 1[?] to 20,000. A few hundred of these are Danes and the rest Greenlanders. No true eskimos remain in Greenland. The native population being a mixture of eskimo and european. They retain their eskimo language and mode of life. Most have dark, hairless skin, straight black hair, and the occidental slant to their eyes characteristic of eskimos. However, one also sees blond freckled Greenlanders and even red headed ones who clearly show the blood of the whalers and sealers of the past century. The chief occupation of these Greenlanders as they are called is hunting and fishing.

For the last 150 years trade, which was originally referred to as a monopoly, has been conducted by the government. The present trading arrangement, however, would better be described as a cooperative movement. In the early days trading was carried on by a system of barter. Now a currency only negotiable in Greenland but with the same value as that of Denmark is used. Employing it as a medium of exchange the trading company purchases from the natives whatever products they have to sell. In each settlement there is a Dane who handles the business of the trading company. There are no stores as we think of them. The commodities that can be purchased are about what one would expect at a country store.

They consist largely of such staples as bread, tea, coffee, flour, and sugar. Woolens, hardware, guns, and shooting necessities. Coal and kerosene is also available. Alcohol is not sold to the natives though like all peoples they make a brew of their own. It is of low alcoholic content and disagreeable to taste, - at least to me. The prices charged natives for imported commodities and the prices which they in turn receive for their products do not follow any accepted principle. Market prices are disregarded, but rates adjusted to one another so that purchases will approximately equal sales. Accounts frequently show a deficit and are subsidized by the state. A distinction is made between commodities considered necessities and those that are luxuries, the former often being sold at a loss.

It should be pointed out that although the native products are purchased by the trading company without respect to their market value, the Danish government has not been guilty of exploiting the natives. It has been the aim of the Danes to protect them from the unfortunate consequences of civilization--an aim which has been realized to a fair degree. The Danes have brought no automobiles or mechanized equipment to Greenland to compete with the native labor. There are no roads, no railroads, and the natives live and travel in a very primitive fashion. Even the little civilization the natives have been exposed to has had a deleterious affect on them. They are lazy and improvident. This latter trait seems to be characteristic of most eskimos, however, the original eskimos were expert

THIS PAGE IS DECLASSIFIED IAW EO 13526

hunters and could always procure food. Now they have lost much of their hunting skill and in the winter may be thrown completely on the charity of the Danes.

Formerly the products sold to the trading company consisted largely of blubber from seals, whales, and walrus, fox, bear, and carribou pelts, and eider down. The protection of eider ducks has created some local adjustments in economy, but the decline of sealing, which was formerly the chief industry, has had more serious repercussions. The seal was the staff of life, supplying skin for clothes, oil for heat, meat for food, and blubber to be sold for money needed to purchase the necessities of life. Fortunately the appearance of an abundance of fish has provided the population with a new means of livelihood. Fishing is carried on not only from Kayaks and Umiaks but also from small diesel powered boats which some of the natives have banded together to buy. At Ivigtut there is a cryolite mine. This substance is a fluoride of sodium and and aluminum necessary in the production of aluminum. Cryolite is virtually unknown in the rest of the world. Workers come out from Denmark to work the mine, are paid well and remain five years. Most of the ore before the war was sent to U.S.A. and of course now all of it is.

In southern Greenland there is a small amount of sheep raising done.

There are no trees in Greenland hence wood is very precious. The Greenlanders are like children over lollipops when they find one of our dumps with empty wooden boxes, old nails, and tin

THIS PAGE IS DECLASSIFIED IAW EO 13526

cans to be had for the taking.

By nature the Greenlanders are traders and seem to love haggling over a purchase. When swaping the invariably bring out their least desirable products first. We trade tobacco, cigarettes and candy and they carved ivory, toy kayaks, dolls, and skin bags. When I was at Cruncher island they would come in the morning and pass the day watching us work. At night they would climb into their umiaks, the men would relax, and the women row home. In fact the male in their society is the gilded bird and the women do all menial work. Like all women they don't care for drinking and hate to see their men get drunk. Our cook made some wine with raisins and cooking yeast. All the men were anxious to try it out on the eskimos. Once the eskimo got started they couldn't be stopped much to the dismay of their women. They evidentally have a very mild capacity and most had to be carried off to their boats to be rowed home by their wives and daughters. They didn't show up for several days afterwards and I imagine that their women had them in the dog house.

HISTORY

Southern Greenland has been known to the European world for more than 1000 years, though its existence was forgotten from the fifteenth to the eighteenth century. Although Gunnbjorn Ulvsson probably sighted Greenland in the year 974, it was not until 982, that Eric the Red sailed past Cape Farwell and then northward along the west coast and into the interior of a large fjord where he built his home, Brattahild.

THIS PAGE IS DECLASSIFIED IAW EO 13526

After a soujourn of three years in Greenland, Eric returned to Iceland with the idea of promoting colonization in the new country. To achieve this objective, like a real estate promoter, he gave the country an attractive name -- Greenland. Actually this is descriptive of the country for the treeless tundra is very green in the early summer when visualized against the rocky hills. Eric had much to sell for his persuasive accounts of deep fjords, pastures, excellent hunting and fishing were tempting to his adventurous listeners. He met with instant success, and in 985 he started for Greenland with a fleet of 25 ships. Of these only 14 ever reached their destination; some returned to Iceland and the remainder were lost at sea. Estimates of the number who reached Greenland that year vary from two to three hundred men, women and children.

The early colonists settled in two areas in southwest Greenland. Despite the inhospitality of the country they made a living by cattle raising, hunting, and fishing; and, moreover, their sagas are evidence of continued literary interests. They attained a considerable degree of comfort and maintained a high standard of culture. Near Julianehaab are the remains of a banquet hall that could have accomodated a hundred people. The total European population in this Arctic country has been estimated at from three to ten thousand people.

In 999 Leif, son of Eric, made a voyage to Norway where he came under the influence of the King who induced him to accept christianity and urged him to introduce it to Greenland. Leif persuaded his mother to become a christian, whereupon in about

THIS PAGE IS DECLASSIFIED IAW EO 13526

1000 A.D. she built a church at Brattahild. It seems entirely possible that by the time of Leif's death in 1021 that the country was entirely christianized. From 1152 when the episcopal see of Greenland at Gardar was made subordinate to the Archbishop of Trondhjein, the church life of Greenland has flourished.

The next important turning point in Greenland history came in 1261 when the colonists submitted to the rule of King Haakon of Norway. This entailed the payment of taxes to a distant ruler, a measure that was passed voluntarily by the legislative body. The whole of trade was monopolized by the King's representatives. While this trade monopoly was enforced during the fourteenth century communications were frequent and regular between Norway and Greenland. During the fifteenth century because of political changes in Norway and the decimation of Norways population by the black death, intercourse between Greenland and Norway was discontinued. The last contact between Norse settlers in Greenland and the mother country was about 1411. Greenland was rediscovered in the sixteenth century. From the sixteenth to the ninteenth centrry its coast was roughly charted by explorers in search of the Northwest Passage and by whalers who were getting an immensely profitable take from the arctic waters about Greenland and Spitzbergen.

Historians have postulated several theories to account for the disappearance of the Norse colonies in Greenland. According to one theory the colonists were killed off by warlike eskimos who came down the west coast from the north. Another postulates

THIS PAGE IS DECLASSIFIED IAW EO 13526

that the settlers were assimilated through marriage by the more numerous and hardy eskimos. Still another story tells us that enemy ships came to Greenland and carried away the colonists to repopulate Europe that had just been decimated by the black plague. It is probable that all of these theories are partially true.

The modern history of Greenland begins in 1721 with the landing of the Norwegian missionary, Hans Egede, in the region of Godthaab fjord. He lived there for fifteen years during which he worked indefatigably as a missionary, leader, colonizer and explorer. He was successful in locating the sites of the earlier colonies and died believing there were descendants of the old Norsemen living in Greenland. The hardships and privations attending life in Greenland were not his only handicaps. Trade was poor, and he met with considerable hostility from official quarters at home.

In 1774 the trade was taken over entirely by the state as a monopoly. Since that time, without interruption, Greenland trade has been carried on by the Royal Greenland Trading Company as a government monopoly. The instructions regulating this trade, especially with reference to the humane provisions for care of the natives, stand even today as memorials of wise colonial administration.

Despite the many excellent features of the provisions pertaining to trade, the total effect has been to support the authority of Europeans. The natives have been losing initiative, becoming poorer, and decreasing in numbers.

THIS PAGE IS DECLASSIFIED IAW EO 13526

For administrative purposes Greenland is divided into three provinces. South Greenland from Cape Farewell to North Ström fjord; North Greenland from North Ström fjord to North East Foreland: and all of East Greenland. Each province is divided into colonies, districts and municipalities.

In each province the highest official is the Landsfoged or Chief administrator and judge supervises the affairs of trade, public health, and the work of lesser officials. Directly under the Landsfoged are the Sysselmaend, or country deputies, who are chairmen of the district councils and country administraters of justice. The highest local authority in all educational and ecclesiastical matters is an arch deacon who makes his home in South Greenland. No Catholic priests or missionaries have been allowed in Greenland. In fact no one is allowed into Greenland without permission of the government and outsiders are discouraged from coming to the country except on official business.

With the outbreak of the present war Greenland was completely cut off from the mother country. She turned to U.S.A. for aid in feeding her population. Trade agreements were reached and the U.S.A. granted military bases in Greenland for the duration of the war. We supply the necessities of life taking in return cryolite and furs. For the former we pay an exorbitant price. The military agreement is strict and though we have a few bases and are to protect Greenland we are welcome in only certain of the larger colonies. Thus numerous small settlements remain that could be used by the enemy. I do not like the set up and

THIS PAGE IS DECLASSIFIED IAW EO 13526

believe we have tow-towed to the Danes too much. My brief contact with some of them leads me to believe that they plan to be on which ever side wins.

VEGETABLE and ANIMAL LIFE

In southern Greenland in sheltered valleys a few stunted birches, willows, and alders growing waist high or a little higher may be found. However, in northern Greenland all vegetation hangs closely to the earth. Surprisingly enough there are over 400 species of plants that flourish throughout Greenland. Many of these are brilliantly colored. Species of Orchids, vilots, lilies, peas, blue bells, and also our familiar dandelions and buttercups bloom simultaneously and in great abundance during the summer. The number and brilliance of color of these flowers north of the arctic circle is one of the most striking marvels of the tyro.

Animal life is not abundant on the land. There are foxes both blue and white, arctic hare, caribou, mosk ox, a few white wolves. There are no snakes, frogs, rats or mice in Greenland.

Great numbers of sea fowl may be found in Greenland during the summer, however, the land birds are scarce. There are three species of sparrows, and the ominous raven which are commonly seen. The ptarmigan, which is a type of grouse, is plentiful. It is brown in the summer and turns white in the winter. The gyrfalcon, deadly enemy of the ptarmigan, is a large swift and fearless hawk. Eagles are found in the north, of all the birds. that come to Greenland the most interesting is the arctic tern which comes each summer to breed in the arctic and then flies

THIS PAGE IS DECLASSIFIED IAW EO 13526

11,000 miles to the antarctic to spend the winter. This is the longest migration known..

The natives formerly lived chiefly from sea fowl, fish and sea animals. The latter include seals, walrus, whale, narwhal, and polar bear. They supplied food to eat, oil for their lamps, and ivory to trade.

Many of the lakes contain arctic charr, a type of trout. Salmon are found in season in the rivers.

MEDICAL FACILITIES

The whole country is divided up into "medical districts" which, generally, are conterminous with the colony districts, and receive their name from the principal colony in each district, viz, Angmagssalik, Julianehaab, Godthaab, Sukkertoppen, Holstensborg, Egedesminde, Jakobshavn, Umanak, Upernivik, and the Thule. The Egedesminde medical district includes Godhavn colony district (Disko Island); and Jakobshavn medical district includes both the colony districts of Christianshaab and Ritenbenk. Ivigtut, the cryolite mine, is separate and distinct and is included in no district.

Each medical district has a hospital located in the chief settlement and supervised by a resident Danish physician and Danish nurse. The doctor is furnished an attractive and modern house. There is no doctor at Angmagssalik but a Danish nurse. All outlying settlements and outposts within a district are visited at least once a year by the doctor in charge. For this purpose the doctor is furnished a single masted motor boat equipped with bunks for the medical staff and any patients that must

THIS PAGE IS DECLASSIFIED IAW EO 13526

be transported.

The hospitals are, in most cases, large wooden buildings of two stories, well constructed and adequately maintained, each having a surgery and laboratory as well as a solarium for tuberculous patients. Godthaab has a 50 bed hospital, Julianehaab a 60 bed and other places corresponding to the relative population. Each doctor is by necessity a general surgeon and is confronted by a wide variety of cases.

In addition to the nurse and doctor in each hospital there are generally several young native girls who serve as ward helpers. These girls serve four years in the hospitals, during which time they receive training as practical nurses. At the end of their training, they go to the various small settlements and outposts and serve as midwives and nurses in the interim between visits from the Danish doctor.

Tuberculosis of various types is by far the most prevalent disease of the Greenlanders, it being estimated that 10-15% of the population has clinically demonstrable TB and that the number is steadily increasing. As yet there are no laws to compel the tuberculosis patients to be hospitalized. If they are ill they consent to remain in a hospital a month or two and then go back to their miserable little huts where they can hardly escape infecting all who dwell with them. Diseases arising from a lack of adequate cleanliness, such as erysipilas, impetigo, mastitis, scabie, furuncles, and carbuncles are also quite common. Contagious diseases such as measles, mumps, whooping cough, chicken pox, small pox and even the common cold are not epidemic in Green-

land. They are occasionally brought in by ships and when they are, usually become epidemic and have an exceedingly high mortality rate. Gonorrhea is prevalent along the west coast. Syphilis is supposed not to exist but the absence of any laboratory set up to do serological tests may well camouflage the fact that the disease exists. Diabetes is said not to exist among the natives. Rheumatic fever is most rare. Degenerative heart disease is seen. Arthritis is common and seems different from rheumatoid and from osteoarthritis. I believe it is due to the cold which seems to have a deleterious affect on the joints that are being given constant use. Last winter we saw many carpenters who developed arthritis of the hands, wrists, and fingers. They were afebrile, did not loose weight, the sedimentation rates were normal. However, if they were not taken off outside work the disease progressed. One went on to develope subluxations of the [illegible] joints of the right hand on acute flexion. He never showed any systemic or laboratory evidence of rheumatoid arthritis, streptococcus infections are rare.

ICE CAP:

The great inner ice cap covering over 700,000 of Greenland's [illegible]0,000 sq. miles is one of the most fascinating phenomena in the world. There is doubt whether it represents the last remnant of the last ice age of about 20,000 years ago or whether it is the beginning of a new ice sheet which is eventually to cover the earth as it has on four previous occasions. Most observers consider the ice cap as a remnant of the last ice age which because of climatic conditions approximately maintains itself from year

THIS PAGE IS DECLASSIFIED IAW EO 13526

to wear. The total mass of this ice is greater than the total land mass of Europe including all hills and mountains. Or to look at it another way it contains forty times as much water in the form of ice as do the Baltic and North Sea combined. Were it to melt, all the oceans of the world would be raised over 25 feet and hence vast areas of low lying land all over the world would be inundated.

At its perimeter the ice cap rises in great jagged irregular peaks that are cut and crossed by deep chasms which make any approach onto it most hazardous. However, after the outer 30-40 miles are passed it rises in a smooth dome which has been measured as 9350 feet thick. Climatic conditions are severe and variable on the cap. The coldest recorded temperature is -85°. During the summer huge lakes and rivers form and disappear in a matter of days. In the summer of 1942 Col. Balchen utilized one of these temporary lakes which was several miles long to land a P.B.Y. on when he rescued a group of American Army pilots who had been forced down on the cap. The day after the rescue this huge lake disappeared, probably through a deep chasm that had opened up.

In 1888 Nansen with a party of five was the first to cross the ice cap. He crossed at about 64° N. Latitude and the journey took about six weeks.

The most brilliant and daring work on the ice cap was done by Admiral Peary. His first attempt to cross the cap in 1886 was unsuccessful. In 1892 he crossed from west to east and back at about 82 N. Latitude. He returned in 1893 again crossing

the cap in both directions. These two crossings of Peary's were considered the most brilliant geographic feats of the time. As well as crossing the cap he charted the north coast of Greenland. Though Peary's and Greely's discoveries the U. S. held claim to northern Greenland. This claim of the U.S.A. was relinquished to Denmark as part of the price paid to the latter for the Virgin Islands in 1916. Since Peary's time the cap has only been crossed three or four times. The last expedition to go out onto the ice cap was the German expedition headed by Alfred Wegener in 1931. In this expedition Wegener lost his life.

In 1925 Admiral R. E. Byrd, then a Lt. Commander accompanied the MacMillian Expedition to norther Greenland. He made several flights out over the ice cap but did not cross it. In 1928 two American pilots Hassel, and Cramer attempted to fly from Newfoundland to Greenland where they planned to refuel and then fly on to Iceland on their way to Sweden. Their plane crashed on the Sukkertoppen ice cap a branch of the main inner ice cap which reaches out near the coast. By some miracles of fate they were able to find their way to a fjord where they were found by members of the Hobb's Michigan expedition which was studying weather conditions in that area. The plane in which they crashed has never been found.

In 1933 Pan American Air Ways selected two possible routes to Europe. A southern and a northern route, the latter route passing over Greenland. Lindbergh in July of 1933 flew to Greenland from Labrador, made numerous airial trips about Greenland and then flew on over the ice cap to Iceland and Europe. He

THIS PAGE IS DECLASSIFIED IAW EO 13526

returned by the southern route. These flights proved the feasability of both the northern and southern routes both of which are in active use today. A commercial route to Europe via Greenland would no doubt have been established prior to the war if permission to fly this route had not been denied to the U.S.A.

This northern route to Europe holds great promise as a peace time aerial route. First it permits frequent landing fields thus allowing more weight to be taken by cargo and less by gasoline. But more important is the fact that to all parts of the world the arctic route is the shortest. One has only to take a globe to see how amazingly close together the world gets when viewed from the polar regions. Without doubt one of the main aerial routes to Europe and to Russia after the war will be through Greenland.

ANNEX C TO COMMANDER TASK FORCE NANOOK

OPERATION PLAN NO. 1 - 46

INTELLIGENCE

SUMMARY:

I. INTRODUCTION

Operation NANOOK will be conducted in the BAFFIN BAY-VISCOUNT MELVILLE SOUND areas of the NORTH ATLANTIC OCEAN during the summer of 1946. Necessary diplomatic arrangements with CANADA and DENMARK are being made for Naval operations in the coastal waters of the CANADIAN ARCTIC and GREENLAND.

II. GREENLAND - General

GREENLAND is administered by the GREENLAND Administration, which is set up under a special committee of the Danish Parliament to administer to the commercial and personal welfare of the 18,000 Greenlanders and 500 Danes who reside on the largest island in the world. All trade is a monopoly of the Administration, primarily for the purpose of safeguarding the comparatively primitive Greenlanders from the sharp practices of other powers' commercial interests. Similarly, the Danes have always exercised a fairly rigid control over ships visiting GREENLAND. This stringent control has been somewhat modified in recent years in favor of U. S. Government vessels because of the assistance which the U. S. C. G. Greenland Ice Patrol has given to the navigators of all countries using the NORTH ATLANTIC ship lanes, and because of the informal aid and courtesy which the Coast Guard has rendered to the Greenlanders. Since the establishment of U. S. Army and Navy bases in GREENLAND during the recent war under the 1940 Defense Agreement, there has been considerable contact between the two countries, although

the Agreement specifically provides for the segregation of our Armed Forces from the Greenlanders (various ONI reports). It is essential that U. S. Navy personnel of NANOOK take account of these factors and observe to the letter such arrangements as the SOPA may make with the local authorities in the THULE area.

It is probable that Commander TEGNER of the Danish Navy will take steps this summer to reestablish a small naval base at GODTHAAB, the capitol (State Dept, incoming despatch from COPENHAGEN, May, 1946). It is also probable that the Danish War Ministry will send a geodetic expedition to GREENLAND this summer. (Outgoing State Dept. despatch to GODTHAAB, May, 1946). These and the proposed visit of the Greenland Committee of the Riksdag (State Dept. incoming despatch from COPENHAGEN, March, 1946) indicate a renewed interest in exercising sovereignty over the area which we cannot ignore if our relations with the Danes are to remain satisfactory.

In addition to Commander TEGNER, RDN, other personalities are Governor BRUN of NORTH GREENLAND, Governor SVANE of SOUTH GREENLAND, Mr. SIMONY of the Greenland Administration, and Director OLDENOW of the Greenland Administration. The United States maintains a Consulate at GODTHAAB, the capitol. Time in WESTERN GREENLAND is 3 hours slower than Greenwich Mean Time.

III. CANADIAN ARCTIC - General

The North American Arctic Archipelago includes the islands north of the mainland of CANADA from 140° W. to a line between GREENLAND and BAFFIN ISLAND running north along the eastern shores of NORTH DEVON and ELLESMERE ISLANDS to 60° N, thence to the pole. The Archipelago lies almost entirely within the TERRITORY of FRANKLIN, Northwest Territories. (RCMP Quarterly, April, 1945).

The Northwest Territories are administered by a Commissioner and five colleagues appointed by the Governor-General. Ordinances are promulgated either by Canadian Orders in Council in the name of the Dominion Government or by the Department of Mines and Resources, which has the primary interest in the area. Actual police and commercial control, as well as the welfare of the 150 white and 6,000 Eskimo inhabitants,

0160

THIS PAGE IS DECLASSIFIED IAW EO 13526

is in the hands of the Royal Canadian Mounted Police, whose ships and aircraft are the main supply and communication factors in this vast territory. The Hudson Bay Company is still the principal commercial enterprise. (Outline of the Canadian Eastern Arctic, by J. L. Robinson). Its ship, RMS NASCOPIE, makes an annual patrol to the CANADIAN ARCTIC. This year it will navigate in the LANCASTER SOUND-BAFFIN ISLAND area on its return trip from HUDSON BAY, calling at FORT ROSS 10 September, ARCTIC BAY 14 September, DUNDAS HARBOR 15 September, POND INLET 20 September, and PANGNIRTUNG 28 September. Three U. S. Navy observers will be aboard the NASCOPIE.

The North American Arctic Archipelago is ordinarily divided into three groups for purposes of reference, northern, eastern, and southwestern. NANOOK parties will land on NORTH DEVON and MELVILLE ISLANDS of the Northern Group, which is separated from the other groups by the water passage comprising LANCASTER SOUND-BARROW STRAIT-MELVILLE SOUND. Although the larger islands of the Arctic Archipelago, BAFFIN, NORTH DEVON and ELLESMERE, have more or less permanent icecaps in their interiors, they do not affect the weather of adjacent areas to the same extent as the Greenland Icecap (RCMP Quarterly, April, 1945). The east coast of BAFFIN ISLAND, particularly in the north and including BYLOT ISLAND, has high precipitous rock cliffs, broken inlets, and small glaciers from which bergs break off, and is, therefore, typical GREENLAND terrain on a smaller scale. The eastern part of NORTH DEVON ISLAND is a high tableland with broken crystalline rock formations near the coast, and a more or less permanent icecap in the interior. The western part of the island consists of somewhat lower, rolling land with considerable vegetation and animal life (H.O. No. 74). According to the RCMP Quarterly, April, 1945, the south shore is high, with many cliffs. The western shore of northern BAFFIN BAY, ELLESMERE LAND, consists of deep bays, prominent headlands, steep cliffs, and more glaciation in recent years than at the beginning of this century, now being 9/10 permanently ice-covered. (H.O. No. 74). MELVILLE ISLAND is generally lower than the easternmost islands of the Archipelago, apparently has no permanent icecap, and supports considerable vegetation and wildlife, (Canada's Western Northland, by Department of Mines and Resources, 1937).

In general, when the ice began to recede at the end of the Ice Age, the land began to rise in these islands. This resulted in the formation of ridges and terraces along the shores of islands as icecaps receded toward the interior. Then, as frost and broken-off glaciers wore them down, the ridges and terraces disintegrated into scattered sedimentary rock, almost "debris", along many beaches, or at the foot of the cliffs which jutted up from the sea. Those places at which the beaches or fjord shores are widest and where the rock disintegration has been greatest afford the best opportunities for military or naval establishment or air strips. (Outline of Canada's Eastern Arctic, J. L. Robinson).

IV. NANOOK LANDING AREAS

THULE, northwest GREENLAND (76° 33' N, 68° 48' W) is a settlement on the shore of NORTH STAR BAY, a branch of WOLSTENHOLME SOUND, lying 12 miles northeast of CAPE ATHOLL (76° 28' N, 69° 30' W). See H. O. Misc. Chart 9540, Sheet I, and Danish Charts "UPERNIVIK-ETAH" reproduced by H.O. The entrace to WOLSTENHOLME SOUND is about 4.5 miles wide. MOUNT DUNDAS, 616 feet high and square topped, lies near the northern promontory at the entrance. A sunken reef lies outside a line joining the entrance promontories. The sound end of the reef is 2.5 miles WNW of the southern promontory. The reef extends in a northerly direction for one mile. Shallow water extends along the south shore of WOLSTENHOLME SOUND for about 5 miles inside. (H.O. No. 74). Anchorages may be found in NORTH STAR BAY in 12 fathoms.

THULE is the home station for the 250 SMITH SOUND or Polar Eskimos who form the most northerly group of inhabitants of the world. They hunt from the HUMBOLDT GLACIER to CAPE HOLM and have a relatively high degree of culture. (U. S. Government South Greenland Survey Expedition, 1940). THULE station was founded by Knud Rasmussen in 1910 on behalf of the Greenland Administration for trading and for polar exploration. Since that date several expeditions have set out from this area, the most famous of which was the Fifth Thule Expedition of 1921-24. At present THULE has a school, a church, a 14-bed hospital, a Danish nurse, and a Danish colony manager. (MID War Dept. Intell. Report from NY, No. 12392 of January, 1944).

DUNDAS HARBOR, NORTH DEVON ISLAND, where the NANOOK Marine Detachment may camp, lies on the south shore of the island at 74° 34'N, 82° 10'W. There is a strong surf running onto the beach, causing vessels to roll continuously, according to the skipper of the RCMP launch ST. ROCH who was there in the summer of 1944. There are a few unoccupied police buildings on a small bight beyond a narrow neck of land a little to the east of the harbor, "which is large enough for ships of almost any size." To the west of DUNDAS HARBOR is a good-sized inlet, either STRATTON or BURNETT CREEK. Seven miles from its mouth is a small cove protected by a sand spit. In the cove are at least 18 fathoms of water. Nearby are some old Eskimo dwellings. The fall freeze-up in the vicinity of DUNDAS HARBOR takes place about 15 October. It is generally ice-free from the end of July. Mean temperatures of 34.7 degrees have been recorded there in June, 41.8 degrees in July, 38.6 degrees in August, and 32.1 degrees in September.

WINTER HARBOR data may be found on B.A.Chart 261, most of which was recorded by Bernier's Canadian Government Expedition in 1909. According to the skipper of the ST. ROCH (1944) the water close to the shore is very shallow. "It is necessary to wade through soft muck to get ashore." There is a small storehouse at the inner harbor, apparently built by Bernier. Nearby creeks may be dry in summer, although many caribou and muskox tracks were found. Thirty miles northeast of WINTER HARBOR, off the low south coast of MELVILLE ISLAND, is DEALEY ISLAND, where the Kellett Expedition left a considerable cairn early in the nineteenth century. This has largely disintegrated. Anchorage may be obtained in close in 15 fathoms. Mean temperatures of 30.5 degrees have been recorded there in June, 41.1 degrees in July, and 15.8 degrees in September. (No data available for August.

V. SEA ROUTES AND ICE CONDITIONS

The LABRADOR SEA is comparatively warm due to the branch current of the Gulf Stream which flows through it. There is a northeasterly swell and a dry, unstable generally-prevailing offshore wind of force 5 or 6 from the north and northeast. The depth of the icefields along the LABRADOR and BAFFIN ISLAND coasts was 150 miles in some places, near which fields the sea and air temperatures were respectively 10 and 20 degrees lower and the sea much calmer. (From April 1946 Aerological Report of Operation FROSTBITE, CV MIDWAY.)

THIS PAGE IS DECLASSIFIED IAW EO 13526

According to the U. S. Government S. Greenland Survey Expedition Report, 1941, in approaching DAVIS STRAIT and the west coast of GREENLAND from ST. JOHNS, stand along the 50th meridian to within 15 miles of NUNARSUIT (60° 35'N, 45° 48'W). According to Pilot Instructions from the USCGC Campbell report to Coast Guard Headquarters 21 June 1940, stand north on 52° 30' at least as far as the FYLLAS BANK, (63° 40'N, 62° 53'W). Winds from the north drive the ice away from the coast of GREENLAND, winds from the south tend to drive it toward the coast.

DAVIS STRAIT (see B.A. Charts 2177 and 235) is about 180 miles wide at its narrowest point. Depths range from 40 to more than 1000 fathoms, the deepest water lying off the western shore. The eastern extremity of DAVIS STRAIT and the southern tip of GREENLAND is CAPT FAREWELL (59° 45'N, 43° 50'W) around which moves the Storis or East Ice during the early summer. Currents from the Polar Sea carry some of the Polar Pack down the east coast of GREENLAND, west around CAPE FAREWELL, and up the west coast of GREENLAND, some of which floe ice extends to seaward in the DAVIS STRAIT and BAFFIN BAY as much as 100 miles and to the northward as far as 63 degrees. The greatest number of bergs is reported between CAPE FAREWELL, and FREDERIKSHAAB. Further north their number decreases, and it may be said that the Storis breaks up in the vicinity of NUNARSUIT. Bergs may therefore be expected from 150 miles south of CAPE FAREWELL to 150 miles to the northwest in DAVIS STRAIT. (Arctic Pilot, 3rd Edition). Further north, from DISKO ISLAND to UPERNIVIK, bergs break off and drift out from the UMANAK and other large glaciers during July and August, although the waters off the west coast of GREENLAND are generally supposed to be ice-free during the months July through October. (H.O. No. 74).

The West Ice and Middle Pack provide the other principal navigational hazards in BAFFIN BAY and adjacent waters. As the Polar Sea Pack moves in a clockwise direction north of the North American Arctic Archipelago and the GREENLAND land masses, it discharges ice into the straits and sounds in a southerly and easterly direction through the archipelago and the KANE BASIN. The West Ice is carried southward by the Arctic currents during the end of June and early July through JONES and LANCASTER SOUNDS and sets toward the western side of BAFFIN BAY. SMITH SOUND north of about 78° remains frozen until August, at which time

THIS PAGE IS DECLASSIFIED IAW EO 13526

it sends its heavy ice, together with some ice from KANE BASIN, southward along the western shore of BAFFIN BAY. This is known as the Middle Pack. There is therefore an ice-free navigable strip or interval of open water in the northern reaches of BAFFIN BAY during the summer, known as the NORTH WATER, the southern edge of which extends from POND INLET on the northeast tip of BAFFIN ISLAND in a generally northeasterly direction to CAPE YORK (75° 54'N, 66° 30'W). Occasionally the West Ice and the Middle Pack pick up bergs which have drifted across from the west coast of GREENLAND north of DISKO ISLAND, i.e., with an East or Southeast wind. (Arctic Pilot. See also Ice Atlas of the Northern Hemisphere, H.O. No. 550.)

In proceeding northward through BAFFIN BAY the recommended passage before the end of August is the so-called "North-about passage", by which a vessel stays as close to the west coast of GREENLAND as possible, i.e., just to the seaward of the outer edge of land ice along the coast. An alternative and somewhat shorter but riskier route is followed by cutting across the middle of MELVILLE BAY (not to be confused with VISCOUNT MELVILLE SOUND in the CANADIAN ARCTIC) in a northwesterly direction if the land ice in MELVILLE BAY has sufficiently broken up. To negotiate this so-called "Middle Passage" a vessel heads from UPERNIVIK (72° 50'N, 56° 80' W) directly for CAPE YORK. The third possibility is to head along the west shore of BAFFIN BAY, but this is rarely possible except very late in an unusually good season. (H.O. No. 74).

Gales encountered off the west and southwest coasts of GREENLAND which blow down the fjords from the interior ice-cap are ordinary katabatic winds (sometimes referred to as GREENLAND Fohns). Cold air which has settled on the ice-cap has a tendency to flow toward the low pressure areas which move toward BAFFIN BAY and DAVIS STRAIT from the south and west. The long narrow depressions formed by the fjords of WEST GREENLAND serve as funnels for these winds, which gradually become warm and tend to dissipate at the coast or within 100 miles to seaward. (Admiralty Weather Manual, 1938). Seaplanes operating in or at the mouth of these fjords are particularly susceptible to damage from such winds.

LANCASTER SOUND, which extends between the northern coast of BAFFIN ISLAND and the southern coast of NORTH DEVON ISLAND for a distance of 170 miles, is entered between CAPES HAY and OSBORN which are 40 miles apart. It is generally navigable between June and the end of September. An easterly current strong along the south shore, sets through the Sound.

Ice conditions tend to worsen as one proceeds to the west and are worst off the mouths of tributary channels. For instance, young slush ice begins to form in PRINCE REGENT INLET (74°N, 88°W) about 1 September to such an extent that that tributary of LANCASTER SOUND is sometimes closed after 1 September (Northwest Passage of St. Roch, 1944). It is advisable to follow close to the northern shore when proceeding westward through LANCASTER SOUND. However, the Sound itself has rarely been unnavigable during the summer, even to the square-rigged ships of the many expeditions which have negotiated it during the past century.

Beyond LANCASTER SOUND and to the west is BARROW STRAIT, 105 miles long and from 30 to 60 miles wide. It is also well to stay near its northern shore when proceeding westward.

Mariners have always had considerable respect for the ice of VISCOUNT MELVILLE SOUND. Because of the prevailing easterly current through MC CLURE STRAIT (74°N, 115°W) it is always necessary to pass around some sort of local pack when navigating in or through MELVILLE SOUND, either by skirting the south coast of MELVILLE ISLAND or the north coast of VICTORIA ISLAND. Upon reaching the west side of the Sound, completely open water may be found to the south of the DUNDAS PENINSULA (not to be confused with the DUNDAS HARBOR area on the south coast of NORTH DEVON ISLAND) extending into the mouth of PRINCE OF WALES STRAIT (73°30'N, 115°W). The PRINCE OF WALES STRAIT is more generally open than MC CLURE STRAIT, especially since the Polar Sea is more likely to be ice-free south of rather than to the west of BANKS ISLAND. ("Polar Navigation", RCAF publication embodying memoranda of Stefansson).

Larsen (NW Passage of the St. Roch, 1944) obtained soundings of 90 and 63 fathoms in MELVILLE SOUND. He observed large floes with sharp edges, indicating that the ice had not been subjected to great pressures, and extremely narrow leads through the ice.

VI. POSTS AND STATIONS.

According to Annex Able to Operation Plan of the USCG Greenland Patrol 1-46 of 28 March 1946, the United States installations in GREENLAND and the CANADIAN ARCTIC are as follows:

(a) SONDRESTROM FJORD Army Air Base (BW8). (66°59'N. 51° 02'W. H.O. Chart 5614).
(b) MARRAK (BW2): Army emergency landing field and Coast Guard Light Station (63°26'N. 51°16'W., on H.O. Chart 5612).
(c) GRONDAL (ARSUK FJORD); Naval Operating Facility. (61°13.8'N. 48°07.0'W, on H.O. Chart 5610).
(d) KAJARTALIK ISLAND: Coast Guard Light and Radio Beacon Station. (61°09.6'N. 48°32.0'W. on H.O. Chart 5610)
(e) NARSARSSUAK: Army Air Base (BW1): Headquarters Greenland Base Command: SOPA, Greenland and Naval Facility. (61°08.8'N. 45°25'W. on H.O. Chart 9540, sheet 44.)
(f) SIMIUTAK ISLAND, SKOV FJORD (BW3): Army Aircraft Radio Range, Army Weather Station and Coast Guard Light Station. (60°40.6'N. 46°31.6'W. on H.O. Chart 9540, sheet 44).
(g) GAMATRON ISLAND: Coast Guard D/F Station. (60°39.7'N, 46°24'W. on H.O. Chart 9540. sheet 44).
(h) FREDERICKSDAL: Loran Station, Coast Guard Unit 15. (60°00'N. 44°39.4'W. on H.O. Chart 5610).
(i) PRINCE CHRISTIAN SOUND: Army Weather Station. Army Aircraft Radio Range and Coast Guard Light Station. (60°02.2'N. 43°06.8'W. on H.O. Chart 5770).
(j) CAPE ADELAER: Army Weather Station. (61°47'N. 42°14'W. on H.O. Chart 5771) (Danish manned).
(k) SKJOLDUNGEN: Army Weather Station in Caroline Amalie Harbor. (63°11.8'N. 41°20'W. on H.O. Chart 5772). (Danish manned).
(l) IKATEQ: Army Air Base. (65°56.5'N. 36°40.1'W. on H.O. Chart 5773).
(m) WALRUS BAY: Army Weather Station. (70°29.5'N. 21°57.6'W, on H.O. Chart 5788).
(n) NARSAK; Army Weather Station. (60°54'N. 46°00'W, on H.O. Chart 5610. Danish Manned).
(o) KANGERLUGSSUAK; Army Weather Station. (68°09'N. 31°45'W. on H.O. Chart 5775, consec. 5054, Danish manned).
(p) DANEBURG Army Weather Station. (74°11'N, 20°13'W, on H.O. Chart 5779, consec. 5063. Danish manned.)

THIS PAGE IS DECLASSIFIED IAW EO 13526

(q) FORT CHIMO, QUEBEC (CRYSTAL 1): Army Air Base on west bank of Koksoak River. (58°10'N. 68°24'W. on H.O. Chart 5380).
(r) SYLVIA GRINNEL RIVER: Army Air Base, Upper Frobisher Bay, Baffin Island (CRYSTAL 2). (63°42'N. 68°32'W. on H.O. Chart 5380).
(s) LAKE HARBOR: Army Weather Station, Baffin Island. (62°50'N. 69°50'W).
(t) FORT CHURCHILL, MANITOBA: Army Air Base and Port of Embarkation. (58°47'N, 94°07'W, on H.O. Chart 5380).
(u) PADLOPING ISLAND, BAFFIN ISLAND (CRYSTAL 3): Army Weather Station, (67°02'N, 62°39'W. on B.A. Chart 235).
(v) RIVER CLYDE ARMY WEATHER STATION, BAFFIN ISLAND. (70°20'N, 68°30'W).

VII. PORT FACILITIES - SUPPLEMENTARY INFORMATION.

SONDRE STROMFJORD BASE, BW 8, is about 100 miles up the fjord. The bottom is muddy. Depths are approximately 15 fathoms. Twenty to thirty medium-sized vessels may anchor. However, because of the shallow draft alongside the wharf, it is necessary to discharge into lighters. (DIO 3ND Report 3-43).

Naval Operating Facility, GRONDAL (IVIGTUT), is located on the ARSUK FJORD area 4,355 miles from NEW YORK. Ships may anchor in KUNGNAIT BAY, north of ARSUK ISLAND. This is reputed to be the best harbor in GREENLAND, with a blue clay and rocky bottom, but a tendency to drag. Depths range from 10 to 15 fathoms. Tidal range is about seven feet. Winds are from the north during the winter, the south during the summer. The cryolite wharf at IVIGTUT will take a 400 foot vessel alongside drawing about 20 feet of water. Limited crane, warehousing, fuel, and cold storage facilities are ordinarily available in connection with the mining of cryolite, but these have been undoubtedly improved by the U. S. Army and Navy during the recent war. (MID 13380 of 3-44, NY) (W. GREENLAND, Survey of Ports, 1940, by Capt. Lacey, A.C.). Oil Storage capacity in 1940 was 140,000 gallons. Water is piped from a nearby lake.

NARSARSSUAK, BW1, is on TUNUGDHARFIK FJORD. Just to the south and west of the airfield is a limited anchorage for ships drawing between 17 and 30 feet on a silt bottom with poor holding characteristics and high velocity winds coming down through the fjord.

HOLSTEINBORG, 66°50'N, 53°50'W, has a small, natural, nearly land-locked harbor, with anchorage for one or two large ships in 20 to 30 fathoms in its outer reaches. Several small motor ships (c.200 tons) may be accommodated alongside a 300 foot wharf in depths of from 8 to 10 feet at low tide. Tidal variation is 15 feet. There are limited workshop, warehousing, cranage, and oil storage facilities.

GODTHAAB, the capitol of GREENLAND and seat of the American Consulate, 64°10'N, 52°15'W, has a depth alongside a wharf of 10 feet at low tide (variation 15 feet), limited warehousing and fuel storage facilities.

The following list comprises meteorological stations established by CANADA, according to "Polar Navigation", an RCAF publication dated 12-42, embodying various reports and memoranda by V. Stefansson. Additional data comes from "RCMP Quarterly" of April 1945, and from "Canada's Western Northland", by the Department of Mines and Resources, 1937:

ARCTIC BAY, 73°02'N, 85°10'W (73°00'N, 84°05'W), met. stn. NW coast BAFFIN ISLAND; also radio stn and Hudson Bay Co. post.

BACHE PENINSULA, 79°10'N, 76°45'W, met. stn. and RCMP, on NE coast of ELLESMERE ISLAND (possibly inactive).

CAMBRIDGE BAY, 69°05'N, 105°00'W, met. stn. RCMP post, and Hudson Bay Co. post on SE coast VICTORIA ISLAND.

CLYDE RIVER, 70°27'N, 68°34'W, met. stn. and Hudson Bay Co. post, NE coast of BAFFIN ISLAND.

CRAIG HARBOR, 76°12'N, 81°02'W, met. stn. and RCMP post, SE coast of ELLESMERE ISLAND.

CHESTERFIELD INLET, 63°20'N, 90°42'W, met. stn. and hospital; west shore HUDSON BAY; also Radio stn and Hudson Bay Co. post.

COPPERMINE; 67°49'N, 115°05'W, met. Stn., RCMP post, a community at west end of CORONATION GULF.

CORAL HARBOR, 64°08'N, 83°10'W, met. stn. south coast of SOUTHHAMPTON ISLAND, HUDSON STRAIT.

RESTRICTED

DUNDAS HARBOR, 74°31'N, 82°24'W, met. stn. and RCMP post SE coast of NORTH DEVON ISLAND; possible now inactive.
FORT ROSS, 71°55'N, 94°15'W (72°02'N, 94°03'W), met. stn. and Hudson Bay post on SE coast of N. SOMERSET ISLAND at east end of BELLOT STRAIT.
GJOA HAVEN, or PETERSON BAY, 68°37'N, 96°W, SE coast of KING WILLIAM ISLAND, Hudson Bay Co. post.
HERSCHEL ISLAND, 69°30'N, 139°15'W, met. stn. north coast of CANADA near ALASKA.
HOLMAN ISLAND, 70°30'N, 117°38'W, met. stn. and RCMP post.
LAKE HARBOR, 62°51'N, 69°53'W, met. stn. and RCMP post, south coast of BAFFIN ISLAND.
NOTTINGHAM ISLAND, 63°07'N, 77°58'W, met. stn. off south coast of BAFFIN ISLAND in Hudson STRAIT.
PANGNIRTUNG, 66°09'N, 65°44'W, (66°09'N, 65°30'W), met. stn., RCMP post, mission, and hospital on north shore of CUMBERLAND SOUND, east coast of BAFFIN ISLAND.
POND INLET, 72°42'N, 77°58'W (72°43'N, 78°30'W), met. stn, RCMP post, Hudson Bay Co. post and two missions at northeastern tip of BAFFIN ISLAND.
PORT BURWELL, 60°25'N, 64°50'W, met. stn. north tip LABRADOR PENINSULA just west of CAPE CHIDLEY.
RESOLUTION ISLAND, 61°18'N, 64°53'W, met. stn. and RCMP post at east entrance to HUDSON STRAIT just south of southeast extremity of BAFFIN ISLAND.
WAKEHAM ISLAND, 61°36'N, 71°58'W, met. stn, south shore of HUDSON STRAIT in center of N. QUEBEC PENINSULA.
PELLY BAY, 68°30'N, 90°W, mission just SE of SE corner of BOOTHIA PENINSULA.
AKLAVIK, 68°02'N, 134°08'W, met. stn.

See also H.O. Air Navigation Chart V 30-3 of May 1943 and H.O. 206 (194?) Radio Weather Aids.

According to the Aerological Report of Operation FROSTBITE, April 1946, weather broadcasts were received intermittently in the LABRADOR SEA-BAFFIN STRAIT area from the following: BELLE ISLE, FOGO, CAPE RACE, GRAND BANKS, and ST. JOHNS in NEWFOUNDLAND; HEBRON, HOPEDALE, GOOSE BAY, CARTWRIGHT, SANDGRIT LAKE in LABRADOR; and FORT CHIMO, FORT MC KENZIE, and CAPE HOPES ADVANCE in QUEBEC. In the Greenland area the following weather stations reported: JULIANEHAAB, FREDERIKSHAAB, GODTHAAB, SUKKERTOPPEN, NARSARSSUAK (BW 1), HOLSTEINBORG, EGEDESMINDE, UMANAK, UPERNIVIK. It was observed that synoptic weather reports from GREENLAND WERE RECEIVED only 30 percent of the time by direct

radio contact. In addition, the S. Greenland Survey Expedition in 1941 reported NANORTALIK, THULE, FAERINGER-HAVNEN, GODHAVN, CHRISTIANSHAAB, JAKOBSHAVEN, GODSSAB, and TORGILSBU, as having ship-shore radio communication facilities.

VII. AIR FACILITIES

Airfield information may be found in H.O. 251 and 252, Naval Air Pilots, and in USAAF Pilot's Handbook for the NORTH ATLANTIC.

According to recent late information obtained by Commander MINI in a report of 16 May 1946, there are no personnel at the ice-strip at PADLOPING BAY (east coast of BAFFIN ISLAND, ATC designation CRYSTAL-3). The fact that this force will be in that area during the period of ice-breakup along that coast would tend to confirm the undesirability of relying on that facility even for emergency use. It is also reported that the runways at CRYSTAL 2, FROBISHER BAY, BAFFIN ISLAND, are in poor condition. NARSARSSUAK, BW 1, GREENLAND, is the only airfield on that island which is really good. SONDRE STROMFJORD, BW 8, is reported to be badly in need of repairs. MARRAK, BW 2, has runways which are now in bad shape, and should be used only in emergencies. Both H.O. and the ATC report that the facilities at BW 9, approach navigational beacon for BW 8 and coastal light at CRUNCHER ISLAND, have been discontinued.

According to U.S. Atlantic Fleet Patrol Squadron 93 Report of July 1942, (seaplanes) when returning to the coast of GREENLAND on top of an overcast, a hole will develop somewhere between BW 1 and GODTHAAB so that it is possible to let down on contact conditions in a fjord sufficiently free of ice in the summer for landing. None but pilots experienced in this country should come down from the direction of the icecap and over the dead glacier which is at the head of the morraine leading into BW 1 Fjord. At any one place along the west coast of GREENLAND during the summer, there should be from 12 to 15 days of pretty good flying weather.

Although KUNGNAIT BAY, 7 miles from IVIGTUT, is a good ship anchorage, Pat. Sq. 93 reports that it is not suitable for a seaplane anchorage because of poor approaches, that there are two rock obstructions in the southern part of the bay, that icebergs and floes are quite prevalent even during the summer, and that the water has frequently been too rough for PBY 5A's.

ANNEX D TO COMMANDER NANOOK TASK FORCE

OPERATION PLAN NO. 1 - 46

NAVIGATION

1. The navigation of ships in Arctic waters will present an unusual problem to navigators who are familiar only with the lower latitudes. The following items are particularly peculiar to the Arctic:

(a) Ice

(b) Unreliable charts

(c) Distorted charts resulting from mercator projections of the polar areas

(d) Large variation errors introduced into the magnetic compass in regions near north magnetic pole.

(e) High latitude errors introduced into gyro-compass.

(f) Long periods of daylight and darkness.

2. The DAVIS STRAIT and waters to the north are completely covered with ice during the winter months. In the summer the sea ice breaks up and navigable passages are opened, but large floes, growlers, and icebergs remain as hazards to navigation, especially during periods of fog or low visibility. During the summer months 24 hour daylight will ease the danger of ships striking heavy ice. Radar can be expected to reveal large icebergs, but cannot be relied on for floes and growlers which float low in the water. Regular aircraft reconnaissance of ice covered areas will be conducted in order to locate the most suitable passages for safe navigation. "Sailing Directions for Anarctica", H.O. No. 138, pages 21 to 33, gives a very good discussion of Arctic ice conditions. For the sake of uniformity ice terms listed on pages 21 to 24 of this publication will be considered standard terminology for the NANOOK Task Force. The "Ice Atlas of the Northern Hemisphere" is a new Hydrographic Office publication and

is an excellent reference for general ice conditions. These publications will be furnished all ships of the task force. It must be remembered in using them, however, that the data they contain is based on a few infrequent observations and cannot be expected to cover all conditions.

3. Charts of the Arctic waters are not reliable. All available charts of the area, including air navigation charts, will be furnished the ships of the task force. In many cases the charts can be depended on only for rough outlines of passages and islands. Soundings will not necessarily be correct. One of the projects during the present operation will be to complete new hydrographic projects.

4. In latitudes above 70° an ordinary mercator chart becomes very distorted, and bearings and fixes cannot be plotted accurately. In order to get a true picture of the polar regions it is necessary to use a polar projection. However, the polar projection is not suitable for plotting or course planning. The inverse mercator projection has been devised to give a chart which will show a true picture of the region and which will also be suitable for plotting. The normal mercator chart is made by projecting the earth's surface onto a cylinder theoretically wrapped around the earth with the line of tangency at the equator. The inverse mercator chart is a similar projection on a cylinder tangent to the earth at the poles. Coordinates on this artificial chart are called grid coordinates. The grid north pole is located at the intersection of the equator and the 180th meridian. A full description of the polar navigation problem including the inverse mercator projection is presented in the front of volume IX of H.O. No. 214.

5. In the region near the north magnetic pole, last recorded position of which was on BOOTHIA PENINSULA in NORTHERN CANADA, the horizontal component of the earth's magnetic field loses intensity, and the force directing a magnetic compass becomes correspondingly weaker. Variation is large: 60° west in DAVIS STRAIT, 120° west in LANCASTER SOUND, 180° in BARROW STRAIT, and 120° east in VISCOUNT MELVILLE SOUND. Local magnetic conditions may cause increased compass errors. In spite of extremely large error, however, the magnetic compass may be depended on for reasonable

Transactions, American Geophysical Union Volume 28, Number 1 Feb 1947

SUITABILITY OF ICE FOR AIRCRAFT LANDINGS

Robert P. Sharp

Abstract--The thickness of ice required for aircraft landings on skis can be calculated from the following formulas:

$$S_r = (15/4)\sqrt{W_t};\; S_l = (27/8)\sqrt{W_t};\; S_s = (27/4)\sqrt{W_t}$$

3.75 3.38 6.75

S_r is the thickness in inches for river ice, S_l for lake ice, and S_s for old sea ice. W_t is the weight of the plane in tons. These formulas allow for the static weight of the plane and its dynamic impact at the time of landing. The thicknesses calculated are for ice formed at or below 16° F. For ice formed at higher temperatures the thicknesses must be increased by about 25 per cent. S_s is for old sea ice. Young sea ice is weaker and must be about three times as thick as river ice. Planes on wheels require about 20 per cent greater thickness than calculated from the above formulas. Ice is stronger at lower temperatures, and its strength increases about four times between 23°F and -76°F. Salt, air bubbles, included vegetation, cracks, and heavy snow cover all make ice weaker. Ice also experiences elastic fatigue under constant heavy use and must be rested frequently.

Freeze-up usually takes place many days or even several weeks after the mean air temperature falls below freezing. After the water temperature reaches freezing, the rate of formation and growth of ice may be predicted from a curve of degree days of frost or calculated by formula.

Salinity retards freezing by lowering both the freezing point and the maximum-density temperature. Currents, waves, and snow cover also retard the growth of ice, but under proper conditions wind can be an asset. Ice continues to increase in thickness well beyond the period of minimum air temperature. Thereafter, it maintains its maximum thickness for a short time before showing a rapid decrease just prior to break-up. Ice deteriorates considerably in spring, and its strength decreases more rapidly than its thickness. This is particularly true of lake ice which "candles." Salty ice honeycombs extensively.

The surface of most frozen fresh-water bodies is usually suitable for landings, but sea ice is often rough and broken. However, many successful landings and take-offs have been made from the ice pack, and a suitable place can frequently be found. Firm, wind-packed snow can have a bearing strength of 100 to 200 lb/in², but wind-swept surfaces are often rough owing to drifts and sastrugi.

Introduction--The following is strictly an office compilation from a variety of sources. It contains no original material and is not based on the experi-

ments or field observations of the compiler, who is no cryologist. These data were assembled during World War II and issued as a preliminary report of the Arctic, Desert, and Tropic Branch of the Army Air Forces Center. The report has been cleared for publication by the United States War Department and is reproduced here in essentially its original form.

The major aim is to provide information pertinent to some aspects of aircraft operations on ice, particularly landings. The formation of ice, some of its physical characteristics, and other factors affecting its suitability for aircraft operations are considered briefly. These matters are not treated from a geographical standpoint, although an attempt is made to provide some means by which approximate thicknesses of ice in remote regions can be predicted.

Problems of ice in relation to aircraft landings have been most fully studied by the Russians. Digests of this Russian information and considerable data from other sources have been made available through the cooperation of A.D. Bajkov, formerly of the Air Technical Service Command, United States Army Air Forces. Much of this compilation should be credited to Bajkov.

Formation of ice--It is now generally concluded that H_2O molecules are at least temporarily bonded together in twos and threes /see "References" at end of paper, DORSEY, 1940/. The single molecule, H_2O or hydrol, is water vapor; the double molecule, $(H_2O)_2$ or dihydrol, is water in the liquid form; and the aggregate of three molecules, $(H_2O)_3$ or trihydrol, is ice. With increasing temperature dihydrol (water) tends to change to hydrol (water vapor) and with decreasing temperature to trihydrol (ice). The significant relation here is that dihydrol (water) contains trihydrol (ice) in solution. At 100°F water is said to contain 16 per cent ice in solution, and this rises to 37 per cent approaching the freezing point (BARNES, 1928), although these figures may not be universally accepted (DORSEY, 1940). At the freezing point water becomes a saturated solution, and ice is precipitated. Super-cooled water behaves essentially like any supersaturated solution.

Dissolved salts lower the freezing point and produce a significant difference in the freezing temperature of fresh and sea water as shown in Table 1. Average sea water has a salinity of 35 parts per thousand and freezes at 28.°6F (WORDIE AND ROBERTS, 1944).

Table 1--Salinity and freezing points

Salinity	Freezing points	
parts/1000	°C	°F
0	0	32
5	-0.3	31.5
10	-0.5	31.1
15	-0.8	30.6
20	-1.1	30
24.695	-1.332	29.61
25	-1.35	29.57
30	-1.6	29.12
35	-1.9	28.58
40	-2.2	28.0

Salinity also affects the freezing point through its influence on density (WORDIE and ROBERTS, 1944). Fresh water reaches its maximum density at 39.°2F, so density currents do not develop with further cooling, and only the surficial layer need be cooled to the freezing point before a layer of ice can form. Conduction complicates this simplified picture to some degree. Water with a salinity of 5°/00 has its greatest density at 37.°2F, so the entire body of water must be cooled to that

0175

temperature before density currents cease. The maximum-density temperature and the freezing temperature approach each other as salinity increases. They coincide when the salinity is 24.°695/00. This means that with a salinity of 24.°695/00 or more density currents operate clear down to the freezing point, and the entire water body must be cooled to this temperature before a layer of ice can form on the surface. The rapidity of cooling and the total drop in temperature are often so great and density currents so slow that ice probably does form in nature before the temperature of the entire body is lowered to the freezing point. Regardless of this, it is clear that salinity retards freezing by lowering the maximum-density temperature as well as by lowering the freezing point.

Heat is lost from water chiefly by conduction, convection, radiation, and evaporation, and any factors affecting these processes are significant in the formation and growth of ice.

Zenith angle of the sun, and therefore latitude, are important because with a low sun water surfaces reflect a considerable part of the solar radiation. The following information and figures are from DEVIK (1944). In northern latitudes in winter the heat received from direct solar radiation and from diffused radiation is far below the amount of heat lost from the water. Loss of heat by infrared radiation is nearly three times as great with a clear sky as with a complete cloud cover. Heat loss by convection is controlled by temperature difference between the water surface and air and is increased by wind. At 14°F air temperature, water temperature 32°F, and no wind, the heat loss by convection is 18.1 cal/in^2/hr. Heat lost by evaporation depends largely upon vapor pressure gradient and wind. At air temperature 14°F, water temperature 32°F, a vapor pressure 2.6 mm mercury, and no wind, the loss by evaporation is 10.9 cal/in^2/hr. Under the same conditions but with a wind speed of 1.12 mph it is 49.7 cal/in^2/hr (DEVIK, 1944). Although wind aids cooling by increasing heat loss through convection and evaporation, it retards freezing by disturbing the surface of the water. However, freezing during a calm following a windy period is benefited by the cooling produced by the wind. Once a layer of ice is formed, wind can aid its growth by blowing away the snow that falls on its surface or by packing the snow more firmly and thereby reducing its power of insulation.

At 14°F, vapor pressure of 2.6 mm mercury, zero wind velocity, no cloud cover, sun altitude 5°, and water temperature 32°F, the total heat lost exceeds the heat gained by 94.8 cal/in^2/hr. With all conditions the same except for a wind velocity of 1.12 mph and cloudiness ten, the heat lost exceeds the heat gained by 150 cal/in^2/hr. In the first case ice will be produced at 0.079 in/hr and in the second at 0.126 in/hr (DEVIK, 1944).

Snow falling into water has a cooling effect, but this is likely to be relatively insignificant except when the water is already close to freezing, However, at this temperature snowflakes aid freezing both by cooling and by providing nuclei around which ice crystals develop.

THIS PAGE IS DECLASSIFIED IAW EO 13526

Water cools slowly and its surface temperature always lags behind the rise and fall of the mean air temperature. In the Murmansk-White Sea area, rivers usually freeze about three weeks after the mean air temperature falls below 32°F. This is probably representative for many similar regions. Lakes usually freeze a little earlier. Inland waters containing much vegetation do not freeze as quickly as clear water, and swift currents in rivers obviously retard freezing and may even prevent it.

The following factors facilitate the formation of ice in the sea: (1) Freshening of the water by precipitation, rivers, or melting of ice; (2) hindrance of wave and other water motion; (3) presence of floating chunks of old ice which cool the water and reduce wave motion; (4) shallow water; (5) lack of currents; and (6) lack of storms (SMITH, 1932, and TRANSFHF, 1928).

Freezing of sea water is first indicated by a greasy or oily appearance and shortly thereafter small spicules and plates called "frazil ice" become visible. Frazil ice increases until the water is covered with a mush of crystals called "slush" or "sludge". This material gradually agglomerates into roughly circular flat masses called "pancakes", and the pancakes are eventually cemented together to form "floes" and sheets" (WORDIE and ROBERTS, 1944). Ice formed on bodies of fresh water is usually relatively clear and smooth, but in the sea such ice forms only in protected coves and narrow lanes or leads cutting through the ice pack. In fast-running streams spongy accumulations of frazil ice on the bottom and along the shores are usually the first phase in the freeze-up (DEVIK, 1944).

<u>Growth and thickness of ice</u>--Heat loss at the rate of 120 cal/in^2/hr causes ice to form at the rate of 0.1 in/hr if the water temperature is 32°F (DEVIK, 1944). Newly formed ice may grow to a thickness of four or five inches in the first 48 hours. Thereafter growth is slower. Once a solid layer of ice is formed, further growth depends chiefly upon conduction of heat through the ice to the colder air above, and this in turn depends upon the steepness of the temperature gradient. The effect of an increasing ice thickness and a snow cover upon heat loss is illustrated in the following diagram, Figure 1. Evaporation from the ice surface and radiation, which takes place only when the ice is clear and its surface free of snow, play a small part.

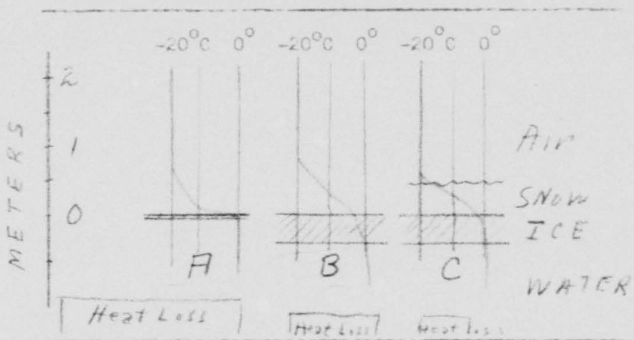

Fig. 1--Thermal gradient and heat loss through: A, thin ice; B, thick ice; C, thick ice and snow (after Devik)

Convection currents in the water usually retard the growth of ice. Sea ice seldom grows to a thickness greater than five to seven feet in the first year. If unbroken through the second winter, the thickness may reach seven to eight feet at the most. Ice in the far northern rivers and lakes can grow to a thickness of six to eight feet in a single season. With rare exceptions this fresh-water ice disappears entirely in summer, but sea ice is perennial in the Polar Basin. Perennial sea ice may grow in thickness during the summer by the following means. Snow on the surface melts, and the water runs down through cracks and holes to form a layer of fresh water under the ice. Since the temperature of the underlying salt water is usually lower than the freezing point of fresh water, a layer of fresh-water ice is formed on the bottom of the sea ice (WORDIE and ROBERTS, 1944).

Ice in the Polar Basin is seldom less than 3-1/2 to 4-1/2 feet thick, and Nansen (ZUBOV, 1940) reports a maximum thickness of 13 ft ten inches produced by about four years of normal growth. Much greater thicknesses can be formed by rafting, tidal overflow, other types of flooding, spray, and splashing. Ice in hummocks and pressure ridges sometimes attains a thickness of 50 to 100 feet.

The rate of growth of fresh-water ice may be calculated by Formula (1) (BARNES, 1928):

$$t = (LSE/K\theta)(1 + E/2) \quad \ldots\ldots\ldots\ldots (1)$$

in which t is the time in seconds for the ice sheet to attain a thickness E in centimeters; L is the heat of fusion, 80 cal/gm; S is the density of ice, 0.9166; K is the conductivity of ice, 0.0057 cal per degree difference of temperature C, per cm^2, per sec; and θ is the difference in temperature, C, between the underside of the ice sheet, assumed $0^{\circ}C$, and the air temperature.

Table 2 provides examples of the results obtained from (1) with the above assumptions. Thicknesses are converted from centimeters to inches and temperatures from Centigrade to Ferenheit.

Table 2--Rate of growth of an ice layer

Thickness of ice	$14^{\circ}F$	$-4^{\circ}F$	$-22^{\circ}F$	$-40^{\circ}F$
in	day	day	day	day
1	0.086	0.043	0.029	0.021
6	1.95	0.98	0.65	0.49
10	5.19	2.60	1.73	1.29
12	7.38	3.69	2.46	1.85
24	28.60	14.30	9.53	7.15
36	63.69	31.85	21.23	15.92

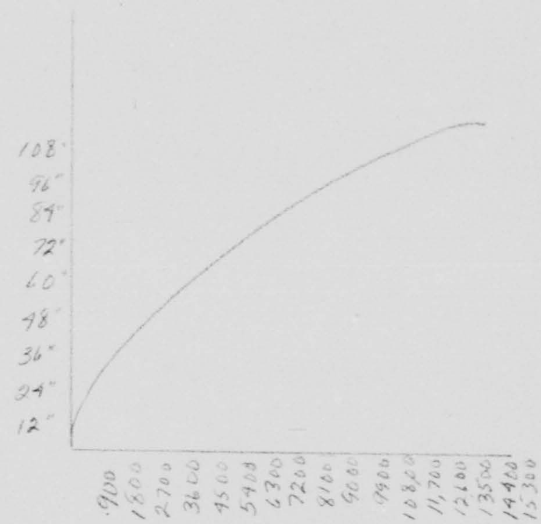

Fig 2--Rate of growth of ice

The approximate thickness of ice may be predicted from the curve of Figure 2 if the temperatures at a specified locality are known. Even if exact temperatures are not available estimates can probably be made from a general knowledge of weather conditions in the region. In calculating the degree days of frost it must be remembered that 0°F is 32° of frost. Furthermore, it is better to add up the mean number of degrees of frost for each day or group of days having about the same mean degrees of frost than to make a single calculation using a large number of days and a mean figure for the degrees of frost for the entire period. Days on which the temperature was below freezing for only part of the 24 hours can be ignored unless exceptionally numerous, and excessive refinements in calculation of degree days of frost are neither necessary nor justified. Examples of calculations of degree days of frost follow. Assume a specified day had eight hours below freezing, and the mean temperature for those eight hours was 23°F. The degree days of frost for that day are $8/24 \times 9 = 3$. Suppose the next day had temperatures below freezing for the entire 24 hours, and the mean temperature was 20°F. The degree days of frost for this day are 12. If the next ten days had approximately uniform mean temperature, say - 20°F, and all hours were below freezing, the degree days of frost for the ten days are 520. The total degree days of frost for the 12 - day period described above would be 535. A glance at Figure 2 shows that the curve permits considerable approximation in calculating degree days of frost without seriously affecting the final results. Obviously other factors such as wind, snow, and currents introduce complications difficult to evaluate and not allowed for in the graph. The lowermost end of the curve is none too reliable because freezing weather may exist for a number of days before ice starts to form. Once a layer of ice has begun to form, the curve is much more reliable unless thawing occurs.

Weekly measurements of ice thickness in far northern harbors (BERNIER, 1910, and LOW, 1906) give curves which rise steadily for two-thirds to three-fourths of the total period, flatten off briefly, and then drop abruptly just prior to breakup.

<u>Physical nature and structures of ice</u>--Ice is reported to precipitate as a colloid from water super-cooled by as little as a few thousandths of a degree (BARNES, 1928). The colloidal particles agglomerate and form plate- and spicule-shaped crystals (BARNES, 1928). In calm fresh water, ice forms long

THIS PAGE IS DECLASSIFIED IAW EO 13526

hexagonal prismatic crystals arranged perpendicular to the water surface. If undisturbed these crystals grow into long pencils equal to the thickness of the ice layer. Freshened sea ice may also develop this structure, but young sea ice is said to consist of an uppermost one-half-inch layer of thin horizontal ice plates about the size of a fingernail with the ice beneath consisting of vertical prismatic crystals (WORDIE and ROBERTS, 1944). Some young fresh-water ice has a similar arrangement. Ice crystals have gliding planes parallel to the base, but experiments show that aggregates of parallel prismatic crystals may yield more readily along the prismatic face than along the base (MATSUYAMA, 1920).

New sea ice usually contains five to 15°/00 salt. Ice formed slowly or in calm weather has less salt than ice formed rapidly or in rough weather. For example, young sea ice formed at 14°F has four to 6°/00 salt, but that formed at - 40°F has ten to 15°/00 (WORDIE and ROBERTS, 1944). As sea water freezes, a network of fresh-water crystals develops, forming pockets which contain salt water. The crystals grow at the expense of this brine, which becomes progressively heavier and more concentrated. Depending upon the temperature, this brine may or may not freeze, and even if it does freeze it thaws readily with rising temperature. Its high salinity and weight enable it to melt a path gradually downward through the ice, and the flushing-out process is facilitated by rising temperature and thawing. In this manner salt-water ice becomes fresh and changes from greasy, streaky and opaque to more or less granular, brittle, and clear, as well as increasing in strength. Hummocking hastens the freshening process by providing cracks for drainage and by lifting the ice above its surroundings so that the brine flushes out more easily.

Arctic sea ice contains three to ten percent air, and fresh-water or brackish-water ice contains about two per cent air. Small air bubbles are spherical, but many of the larger ones are elongated vertically into thread-like tubes. Different horizontal layers of ice may contain differing amounts of air. Usually ice formed quickly or in rough weather contains more air than that formed slowly or in quiet weather (BAJKOV).

Several high-pressure forms of ice are known from laboratory studies, but none has been found in nature (DORSEY, 1940, and SELIGMAN, 1936).

<u>Strength of ice</u>--The strength of ice is dependent upon a wide variety of conditions, some of which will be treated following a simplified consideration of the thickness of ice required for aircraft landings.

Several empirical rules concerning the thickness of ice able to support various loads have been developed. Unfortunately, these do not usually specify the nature of the ice, its conditions of formation, or its environment. A familiar example of such rules are those stating that two inches of ice is considered safe for infantry, four inches for cavalry or light guns, six inches for heavy field guns, and eight inches for loads on sledges weighing not over 1000 lbs per square foot. Blind application of such empirical rules may lead to trouble. The Russians have done considerable work with the loading strength of ice and landings of aircraft thereon. Much of the following material has been derived from their reports (BAJKOV, MOSKATOV, 1938 a and b).

If some data are already available on the various loads borne by ice of known character and thickness, they can be extrapolated, for the required safe thickness of ice is directly proportional to the square root of its tolerable load. Thus, if it is known in a specific locality that a certain thickness of ice, S_1, will bear a load, L_1, then by simple proportion the thickness, S_2, needed to carry a load, L_2, can be calculated as:

$$S_2^2/S_1^2 = L_2/L_1 \text{ or } S_2 = \sqrt{L_2 S_1^2/L_1} \quad \ldots \ldots \ldots \ldots (2)$$

For aircraft landings, both the static load of the plane and the dynamic load or impact at time of landing must be considered. The usual Russian practice is to take six times the static weight of the plane as safely equivalent to these loads combined. Therefore, to obtain the thickness of ice necessary for a plane landing from data for static loads the formula will be

$$S_2 = \sqrt{(S_1^2 \times 6W_p)L_1} \quad \ldots \ldots \ldots \ldots (3)$$

in which W_p is the static weight of the plane. If the thickness of ice for landing of a plane of specified weight is already known, the formula can be used in the form first given.

It is known that fresh-water ice is about three times as strong as salt-water ice. This in-troduces a factor 3 in the formula for converting data from fresh-water ice to salt-water ice, thus:

$$S_s = 1.732\sqrt{(S_{fw}^2 \times L_2)/L_1} \quad \ldots \ldots \ldots \ldots (4)$$

in which S_s = thickness of sea ice; S_{fw} = thickness of fresh-water ice.

From various accumulated data the Russians have developed the following simplified formulas for landings of aircraft with skis:

$$\left.\begin{aligned} S_r &= (15/4)\sqrt{W_t} \\ S_l &= (27/8)\sqrt{W_t} \\ S_s &= (27/4)\sqrt{W_t} \end{aligned}\right\} \quad \ldots \ldots \ldots \ldots (5)$$

S_r is the thickness of river ice, S_l of lake ice, and S_s of sea ice, in inches, and W_t is the weight of the plane in tons. These formulas apply to ice formed at or below 16°F. For ice formed at higher temperatures the thicknesses should be about 25 per cent greater. Lake ice is generally about ten per cent stronger than river ice. Probably no airplane, even the lightest, should attempt to land on fresh-water ice less than six inches thick. The S_s in the third formula above is for old sea ice, which is stronger than young sea ice. The required thickness of young sea ice is about three times that of river ice.

(See Fig. 3 - page 9)

The curves of Figure 3 have been constructed from the above formulas. For planes on wheels the ice thickness should be about 20 per cent greater. Allowances must be made for major cracks and other structural weaknesses.

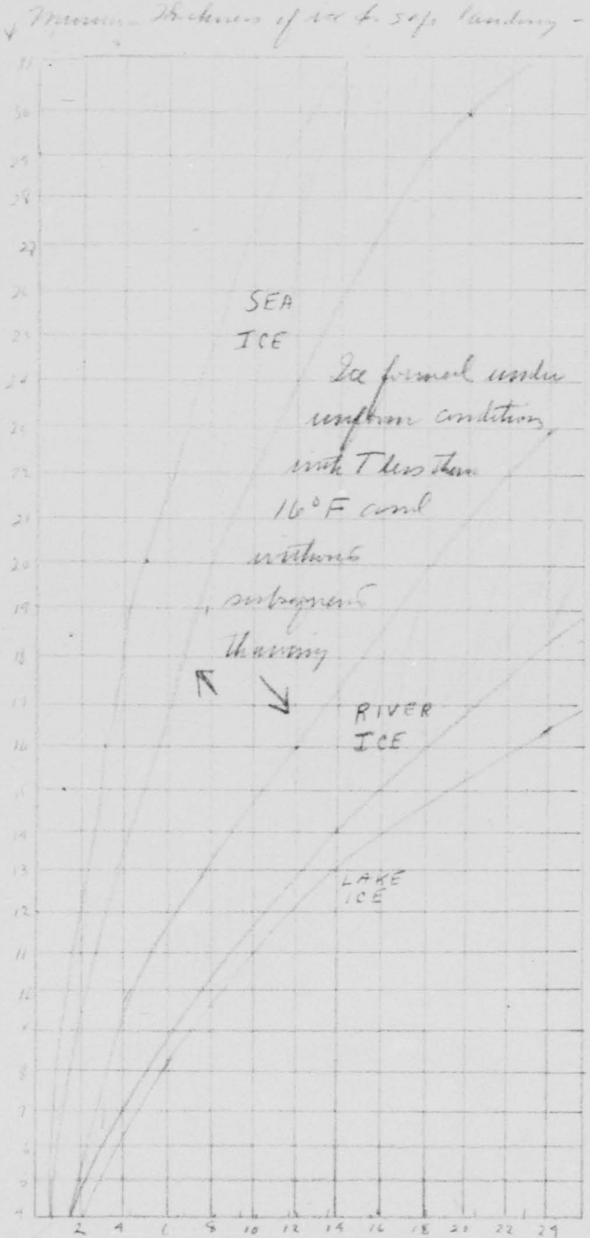

Fig. 3 -- Minimum thickness of ice required for safe landings of aircraft on skis (after U.S. Weather Bureau).

The above data can be checked by the following theoretical calculations. It is known that a roughly circular area with a radius of about 30 meters bears the load of an object the size of an aircraft on the ice surface. On this basis Formula (6) may be used to determine the ice thickness required for a specified load:

$$S_b = (18KP/\pi T^2)\ (1-2r_o/3r) \ldots\ldots (6)$$

in which S_b is the maximum breaking strength taken as 30 kg/cm^2 for fresh-water ice and 15 kg/cm^2 for salt-water ice; K is a coefficient taken at 0.5; r is the radius of a circular plate bearing the load taken at 30 meters; r_o is the radius of circle upon which the load is concentrated -- this is the size of the skis calculated as a circular area; P is weight of the plane in kg; and T is necessary thickness of ice for safe landing, in centimeters.

Substituting the figures for river ice and rearranging we get

$$T_r = \sqrt{3 \times 0.5(1 - 2r_o/3r)6P/3.14(30)}.\ (7)$$

This can be simplified, since $(1 - 2r_o/3r)$ can be taken as unity. Then $T_r = 0.31\sqrt{P}$. This gives thickness of river ice in cm with weight of plane in kg, or $T_r = 3.68\sqrt{P}$ gives thickness in inches with weight in tons. This is very close to the $S_r = 15/4\sqrt{Wt}$ given above, as 15/4 = 3.75. Thus the theoretical and analogical methods check.

Salt makes ice plastic and weak (BRUCE, 1911), and sea ice becomes stronger as it freshens in the manner previously described. Newly formed sea ice less than six inches thick may bend under the weight of a man (BROWN, 1927). It is probably unsafe for heavily loaded sledges and obviously unsuited for plane landings. Most sea ice has a breaking strength of ten to 15 kg/cm^2 in contrast to the 30 kg/cm^2 of fresh-water ice (MOSKATOV, 1938 a and b). The crushing strength

of ice ranges from 327 to 1000 lbs in^2 and increases as the temperature falls, increasing four times between 23° F and 76° F (BAJKOV). Falling temperature, however, leads to contraction and cracking of ice and may weaken an ice layer even though water rises in the cracks and seals them. The tensil strength of ice is about one-third its crushing strength. Vegetation included within the ice makes it weaker.

Ice covered with a thick layer of snow is weaker because it is warmer, and ice becomes much weaker in spring for various reasons treated in more detail elsewhere. An abundance of parallel thread-like air bubbles in some ice decreases its strength considerably.

Ice shows the phenomenon of elastic fatgue and will bend or sag under continual stress (HAYES, 1937). Constant travel of heavy loads over ice causes fatgue and further weakens it by opening and widening cracks. A fast-traveling plan on take-off or landing sends a wave through the ice before it and is followed by another wave. These waves cause fatigue and set up stesses which can be released by boring small holes through the ice (HAYES, 1937). Heavily used runways on ice should be given frequent rest periods to allow recovery from fatigue and sealing of cracks.

<u>Role of snow</u> -- Snow is important with regard to aircraft landins on frozen water bodies because more often than not it constitutes the surficial material. Since it is an excellent insulator it also exerts considerable influence on the rate at which ice forms and the thickness attained.

A common assumption in the North is that heavy snow in the fall means a rapid break-up in spring.

Snow constitutes an extra load on the ice and keeps it warmer, therefore weaker. These disadvantages are partly offset if the snow is well packed. Hard-packed snow does not retard the growth of ice nearly so much as loose snow and has a considerable bearing strength of its own. Wind-packed snow without benefit of thaw may have a bearing strength between 100 and 200 lbs /in2 (BAJKOV). Firm, wind-packed snow of this type is found chiefly in unforested northern areas where strong winds prevail. In such areas the snow tends to be firmly packed throughout, not just on the surface. In other regions a surficial crust on soft fluffy snow may give a misleading impression of the strength of a snow cover.

The snow on areas of ice to be used frequently for landings should be scraped or rolled. Scaping allows a greater thickness of ice to develop, but rolling is preferred in some quarters, possibly because of the bearing strength of firmly-packed snow, or because of unevenness in the underlying ice. In one instance the ice under an area scaped six days before was 16 inches thick and that under a nearby uncleared area was only 12 inches (HAYES, 1937). Air temperatures during this period are not known. Another good reason for clearing snow from the ice is the prevention of slush formed if water gains accessto the snow through cracks or by other means. Several inches of ice are destroyed by formation of the slush, which refreezes slowly even at air temperatures well below zero (HAYES, 1937). If the snow is very thick, water forced up through holes and cracks in the ice forms a layer of slush with the lowermost snow which is entirely hidden by the overlying un-

THIS PAGE IS DECLASSIFIED IAW EO 13526

affected snow (DEPARTMENT OF NATIONAL DEFENSE, 1944). The potential dangers of this situation are obvious. A snow cover on ice constitutes a further hazard by hiding weak spots which might otherwise be apparent from the air. Weak spots in the ice on inland water bodies can sometimes be identified by animal tracks leading up to but not across them. In any case the snow should be cleared from an area larger than that actually needed for operation, so that cracks and holes in the nearby ice have a chance to freeze. Snow should not be piled close to the runway, as it weakens the ice. If the surface of the ice beneath the snow is rough, scaping is obviously out of the question.

Even loose powdery snow changes progressively throughout the season without benefit of thawing. It becomes more granular and better packed. The increase in grain size is due to condensation of moisture from the atmosphere and the transfer of vapor from the vicinity of small grains to larger grains where ice is deposited. This takes place because the vapor pressure around ice grains is inversely proportional to the radius of curvature and is higher around small grains than large ones (SELIGMAN, 1936). The surface of snow in wind-swept regions, although firm, is often rough in detail, owing to the formation of drifts, barchans, and sastrugi. Sastrugi are small ridges of hard-packed snow up to two feet high and then to 15 feet long arranged parallel to the prevailing wind direction. They are capable of upsetting almost any plane on wheels or skis. Barchans are similar ridges lying transverse to the wind.

<u>Nature of ice surface</u> -- The rough surface on sea ice more often limits its use for aircraft operations than thickness or strength. The surface of river and lake ice is usually smoother. Much sea ice is broken, rafted, pushed into hummocks and cracked by tides, winds, and currents in such a way as to make it wholly unsuited for aircraft operations. The open ice pack of summer consisting of separate ice fragments is obviously unsuited for aircraft landings unless some of the floes are exceptionally large. In winter much of this open pack refreezes with a surface that is too rough for aircraft landings until covered with snow. This is true in many of the fiords of East Greenland (WATKINS, 1932). The closed pack may be suitable both winter and summer, although one polar flier has estimated that fully 90 per cent of the Arctic ice pack is unsuitable for aircraft landings (BYRD, 1928). However, there have been many successful landings and take-offs from the Arctic pack, and suitable areas can usually be found (MOSKATOV, 1938 b, and ZUBOV, 1940). Along low lagoon-fringed Arctic shorelines, like the north coast of Alaska, large areas of smooth flat ice are available for winter landings (WILKINS, 1928 a and b).

Springtime melting can make an ice surface very rough. Salty sea ice becomes soft and honey-combed in spring even though the air temperature remains below freezing (DEPARTMENT OF NATIONAL DEFENSE, 1944). It is advisable to avoid areas of ice covered with melt water because the surface beneath is likely to be pitted and rough. However, it is true that melt water standing on ice is an indication of the soundness of that ice. As thawing progresses the water disappears into the ice, indicating that it is honeycombed and therefore weak and unreliable (DEPARTMENT OF NATIONAL DEFENSE), 1944. After the melt water runs off, the ice surface is dry, white, soft, and sticky. Sometimes in spring, water on the ice refreezes surficially leaving a layer of slush beneath. This bad condition is to be expected

THIS PAGE IS DECLASSIFIED IAW EO 13526

following a cold snap during break-up.

Fresh water, particularly in lakes, freezes to a firm smooth surface, but rivers may have areas of very rough ice if the current is swift and and early ice has been broken up prior to final freezing. Ice on rivers may be dangerously thin over areas of fast-flowing water because of erosion on the underside. The surface on newly formed sea ice is sticky even at low temperatures, and sledges, skis, and other sliding surfaces do not move over it easily (BRUCE, 1911). The Russians have been able to produce smooth surfaces on some areas of ice by pumping water onto the surface. This is likely to be unsatisfactory if the snow cover is at all heavy, for the snow and water form a slush which freezes slowly.

Melting and breakup -- Ice and snow are melted by radiation from the sun and by heat conduction from the air, rocks, and water. Another less commonly recognized mode of melting is by condensation of warm moist air. This can be an important factor, for the moisture so condensed melts up to 7-½ times its own weight in snow (LIGHT, 1941).

Heat is more readily transferred through air by eddy diffusion than by molecular conduction. Thus, melting is likely to be greater with a wind than with calm air, and moist wind is a better melting agent than dry wind of the same temperature because of the melting caused by condensation. Cooling by evaporation in the case of dry winds helps to make it less efficient as a melting agent. Pressure facilitates melting by lowering the melting point, but below - 7.6°F (-22°C) pressure will no longer cause melting.

In spring, as the snow on the surface melts, the ice is covered with water. With continued thawing the ice becomes honeycombed with passages and holes into which the surface water drains.

Sea ice less than a year old is still somewhat salty and melts more readily than the older saltfree floes. It also honeycombs extensively as it melts. In spring, land-fast sea ice usually melts first near shore because of the relatively warm water which runs onto it from the land. Wind, waves, currents, and rivers aid break-up and melting by mechanical means.

In spring, lake ice "candles". That is, it separates into long pencil-like crystals by melting of intercrystal films (BUCHANAN, 1908). These crystals slide past each other easily, and ice two feet thick may not bear the weight of a man. In spring, extreme caution must be used in making aircraft landings on lakes.

Break-up on rivers usually occurs three or four weeks after the mean air temperature has risen above 32°F. Ice on lakes breaks up two or three weeks later, and sea ice may break up about this same time.

Operations on ice -- Landings on ice are easier to execute than take-offs swing to unevenesses in the ice surface. Planes operating on crusted snow should be careful not to break through the crust in turning.

Frequent measurements of ice thickness under and around a landing area should be made in spring, or even daily throughout the period of operation if the ice overlies flowing water. Measurements can be made by boring a hole through the ice with an auger. The lower part of such a hole is likely to be cone-shaped, so a hook or L-shaped rod should be used to measure thickness of the ice adjacent to the hole (HAYES, 1937). Measurements made directly in the hole are likely to be an error. The breakup may be preceded by a rapid thinning of the ice, though break-ups can and do occur without any great amount of previous thinning. In high Arctic latitudes ice airdromes could be operated the year around, but any heavily used runway on ice should be given frequent periods of rest to permit recovery from fatigue and sealing of cracks.

Other things to be kept in mind are the notoriously poor depth perception in snow-covered terrain, and the tendency of skis to freeze immediately to ice or snow.

Present Danish Policy with Respect to the DEFENSE OF GREENLAND.

AC/S, A-3 — 21 March 1947
Attn: Colonel Chick

1

AC/S, A-2 — Col Adams/ch/2223

1. In response to the verbal request made to this office by the Operations Division of A-3, A-2 has completed a study of the current relation between U. S. and Denmark and Greenland in an effort to anticipate any modification of the Defense of Greenland Agreement that would influence the conduct of Operation Nanook during the summer of 1947.

2. The Defense of Greenland Agreement in brief is as follows: By agreement dated 9 April 1941 between the United States and Denmark, the United States undertook the responsibility of defending Greenland from Axis aggression and for that purpose received the right to construct and operate necessary bases. This agreement is to remain in force until it is agreed that the present dangers to the peace and security of the American continent have passed. Thereafter, following consultation relative to modification or termination of the agreement, either party may give notice of its intention to terminate the agreement. At the expiration of twelve months after receipt of such notice, the base agreement shall cease to be in force.

3. The War Department in coordination with the State Department has advised this office that no notice of intention to terminate or modify this agreement has been received by the United States.

4. Greenland, along with Iceland and the Svalbard Archipelago are of tremendous strategic importance defensively and offensively in the plans of operations conceived for the conduct of trans polar air warfare. The three areas are equally important in the plans of the United States and of the Soviet Union as they lie astride the great circle route between the industrial area of the Great Lakes and Eurasia; the three areas are all property of Scandinavian nations whose prime desire is to avoid becoming implicated in any East-West competition for bases or in any possible future war.

5. Since the end of the war and the reestablishment of Danish sovereignty, Denmark has become most uneasy over the Defense of Greenland outlined above. While the present government of Denmark is still oriented toward the Western Democracies, Denmark still feels tied nationally to her Scandinavian neighbors. To make permanent the provisions of the Defense of Greenland, i.e. grant the U.S. long term base rights in Greenland, might expose Denmark to Soviet demands for Bornholm or even for bases in North Greenland; or might expose Norway to pressing Soviet demands for joint defensive installations in the

Present Danish Policy with Respect to the DEFENSE OF GREENLAND.

1 (cont)

in the Svalbard Islands or Sweden to claims on her Baltic Islands.

6. In November 1946, the Danish government intimated that the time had come for a discussion of the Defense of Greenland Agreement, but, to date, no formal action has been initiated. The following hypothetical courses of action are available to Denmark for settlement of the United States-Greenland base agreement:

a. The Outright Sale of Greenland to the U.S.
b. Long-term Lease of Bases to the U.S.
c. Granting the U.S. continued use of Greenland until U.S. forces are out of Europe.
d. Continuing Pressure for U.S. Evacuation.
e. Outright abrogation of the Agreement.
f. Maintaining the status quo.

There is at the moment no indication that Denmark will do other than continue to exert pressure to force the U.S. to evacuate. This action will give the Soviets no legitimate justification for counter demands in Scandinavia.

POLITICAL SITUATION WITH RESPECT
TO UNITED STATES BASES IN GREENLAND

21 March 1947

I. Background.

The recent political discussions between the United States and Denmark in regard to Greenland are based on the Defense of Greenland Agreement signed on the 9th of April 1941 by representatives of the United States and the King of Denmark. The major items of that agreement are as follows:

1. The United States recognizes the sovereignty of the King of Denmark over Greenland and accepts the responsibility of the maintenance of its present status.

2. The United States is accorded the right to construct, maintain, and operate landing fields, seaplane facilities, and appropriate radio and meteorological installations.

3. The United States is furthermore authorized to establish and improve harbors, roads, communications and housing, and to have exclusive jurisdiction over these defense areas as long as the agreement shall last, although some sovereignty over the areas is retained by the King of Denmark.

4. The Agreement is to last: "Until it is agreed that the present dangers to the peace and security of the American Continent have passed. Modification or termination of the Agreement will be the subject of consultation between the Government of the United States and the Government of Denmark. After due consultation has taken place each party shall have the right to give the other party notice of its intention to terminate the Agreement. At the expiration of a 12-month period following such a notice by either party the Agreement shall cease to be in force."

II. Denmark's Current Attitude Towards the United States.

Since the end of the War the Danish attitude, although openly cooperative, has been one of fear and distrust of possible encroachment by the United States upon the sovereignty of the Denmark Government over Greenland. The underlying causes of this attitude may be traced to the following trends:

1. Because of Denmark's physical proximity to the USSR, the

SECRET

THIS PAGE IS DECLASSIFIED IAW EO 13526

only State in Europe since the war which has a proven foreign policy of expansionism, Denmark's foreign policy in regard to Russia has been to cultivate her good-will. There is a fear apparent in the attitude of the Scandinavian Bloc, of which Denmark is a member, that any extension of United States controls in Greenland would result in the establishment of retaliating bases by Russia in the Scandinavian area. This attitude will be accentuated when United States occupation forces leave Europe.

2. There has been evidences of intense nationalism developing in Denmark since the war. Her inability during World War II to defend her sovereignty has emphasized her national pride and fear of foreign encroachment. With Iceland's declaration of independence and the projected plebiscite of the Faroe Islands, it is apparent to the Denmark Government that Greenland will remain its only loyal overseas possession and Denmark is determined that no foreign power will impair her control. National pride, fear of losing control over Greenland, and the potential threat of Russian retaliation are, therefore, the basis of Denmark's present attitude toward the perpetuation of United States influence in Greenland.

III. Difficulties encountered in negotiating present agreement over Weather Installations.

1. Original proposals, agreed on by the representatives of the Greenland Government and the United States Army and presented to the Danish Government in May 1946, included the following stipulations:

a. The following stations will be owned and operated by the United States. Wherever possible, however, and in accordance with the rapidity of the training program, Greenlandish or Danish personnel will be substituted for United States personnel:

(1) Cape Adelaer	(4) Prince Christian's Sound
(2) Kangerdlugssuak	(5) Skjoldugen
(3) Narsak	(6) Walrus Bay

b. The Danish owned and operated stations utilizing equipment lent by the United States Army will be as follows:

(1) Angmagssalik	(7) Kutdligssat
(2) Egedesminde	(8) Sukkertoppen
(3) Godthaab	(9) Umanak
(4) Holsteinsborg	(10) Upernavik
(5) Jakobshavn	(11) Thule
(6) Daneborg	(12) Frederikshaab

THIS PAGE IS DECLASSIFIED IAW EO 13526

c. The United States Army will utilize weather reports from all these stations and responsibility for collection of the reports will be charged to the Greenland Administration which will make the information available to U.S. personnel at Narsarssuak.

d. The United States Army, according to the Defense of Greenland Agreement, holds the Greenland Administration responsible for the security of U.S. property. The Greenland Administration is obligated to account for such property and to relinquish it upon demand to the U.S. Army. Furthermore, the U.S. Army will continue to exert operational control over technical functions manned by Danish personnel.

2. At the same time that the above proposal was being presented to the Danish Government in Copenhagen, the USSR made two counter-moves which tended to improve the relations between the USSR and Denmark and depreciate relations between Denmark and the United States. These were:

a. Proved friendliness to the Scandinavian bloc by Soviet evacuation of Bornholm Island.

b. On 29 May, at the invitation of Russia, a Danish trade delegation, headed by Prince Axel, proceeded to Moscow with as its announced objective the formation of a trade agreement mutually beneficial to the USSR and Denmark. In this agreement Denmark was to deliver to the Russian Zone in Germany corn, livestock, horses, and fish in exchange for foodstuffs, fertilizer, oil cake, and wood pulp. The exchange will amount in value to 100,000,000 Kronar ($30,000,000).

c. In conjunction with these developments the Russians attempted to exert pressure on the Danes by issuing many unfavorable reports of the U.S. activities in Copenhagen in Communist controlled press reports.

3. In spite of these difficulties, an agreement was reached on the 7 June 1946, providing for the operation and manning of the 18 Greenland Weather Stations to be effective until 30 June 1947.

IV. Implications of the Agreement of 7 June 1946.

1. Modification to the Greenland Agreement was not effected but these implications are obvious:

a. The new contract is in the form of a letter address-

ed to the Governor of Greenland from the Commanding General, Newfoundland Base Command. No mention is made of the Danish Government in the contract, nor does the signature of the mother country appear. In other words, the Danish Government gave its tacit approval, but cannot be considered a participant to the contract.

b. According to the contract, the Danish personnel will be paid by the Greenland Administration, rather than the U.S. Army. The U.S. Army, therefore, loses its financial responsibility with the exception of such items as maintenance of buildings, equipment and power supplies. The apparent purpose of this modification was to enable the Danish Government to proclaim to the diplomatic world its financial independence from foreign assistance in the control of its weather stations.

c. Arrangements were made for the instruction of Danish personnel by U.S. Army technical personnel in the operation of the Greenland Weather Stations.

d. No mention was made in the negotiations of the status of the US Military bases (BW-1, BW-8, BE-2), or of the status of the Thule Air Base then in the first stages of construction.

e. A desire to have the stations manned by Danes as soon as possible was included.

f. Discussion of the sale of United States weather and communications equipment was strictly avoided.

2. Since this new contract has been in effect the training of Danish personnel has proceeded satisfactorily. The Danish nationals have taken over the complete operation of the weather station at Walrus Bay and Prince Christian Sound. The only weather stations completely manned by United States personnel are:

Narsarssuak (BW-1)
Sondre Stromfjord (BW-8)
Ikatek (BE-2)
Simiutak (BW-3)
Fredrericksdahl (U.S. Navy)
Cruncher Island (BW-9)

The latter station will be manned by U.S. personnel until completely replaced by Danes. The landing strip at Thule

SECRET

has been completed and a U.S. civilian weather bureau station is installed there.

V. Extension of Weather Service.

1. Currently there are 18 weather stations in Greenland, within an area inclosed by the 65th and 85th parallel and the 0 to 90th meridians. There are no weather stations north of the 77th parallel. A vast stretch of Arctic area, from Ellesmore Island to Jan Mayen, has no forecasting facilities. Six sites are recommended by the 8th Weather Group for this area. Although these proposed stations are necessary for our national defense and the improvement of our civil air transport, it is likely that Denmark will not approve their establishment in view of the sensitive relationship of the Scandinavian countries to Russia and Denmark's revived national pride. Even the non-military operation of the U.S. Weather Bureau station at Thule is looked upon with suspicion by the Danish Government and it is likely that she will demand complete manning by Danish personnel.

VI. Scientific Expeditions in Greenland.

1. One method whereby the United States could regain ground lost in Danish good-will at Copenhagen would be to participate in the scientific expeditions in which the Danish Government has lately shown a revived interest. The Danish Government is concerned with the scientific and strategic importance of Greenland.

2. The Peary Island expedition is one of the most important of these expeditions planned. The expedition is to consist of 15 scientists to undertake studies of Arctic botany, geology, seismography, and archeology. It is also designed to undertake magnetic and cosmic ray observations. The base for these operations is to be established at Independence Fjord. The Danish Government has not as yet approved the project. It may ask the United States to furnish financial assistance and weather technicians although fears of political repercussions may prevent the request.

3. Three important advantages would accrue to the U.S. in participating in this expedition:

a. The U.S. would obtain additional important weather information.

b. It could check on the nationals inhabiting this area.

c. It would strengthen its position with the Danish Government.

VII. Political Attitude of Native Greenland Population.

1. It is unlikely that the native Greenland population will reflect any other attitude than that of the Danish Government. The effects of the American occupation of Greenland were practically nil since the U.S. personnel were strictly segregated in accordance with the request of the Danish Government. Due to the strict control by Denmark over trade, travel, and the intermingling of natives with foreign elements other than Danish, the Greenland natives have retained a loyalty to Denmark and they reflect the Danish attitude with regard to the U.S., Great Britain, and Soviet Russia.

VIII. Strategic Importance of Greenland to the United States.

The strategic importance of Greenland to the U.S. may be summarized by the following points:

1. Greenland lies directly across the Great Circle route between the industrial heart of the U.S. and Spitsbergen and Eurasia. It is thus a potential bastion of U.S. defenses. Located approximately 2000 miles from the concentrated industrial complex in the Great Lakes area, warning devices in Greenland could give 30 to 45 minutes warning of the approach of supersonic missiles. A ring of outer defenses in Greenland could possibly be effective in neutralizing such attacks. Further, Greenland used as a base of operations of very heavy bombardment aircraft and long range guided missiles places the critical areas of Eurasia within range for retaliatory attacks.

2. Greenland presents great potentialities for the development of a series of refueling bases for submarines and small surface craft of the U.S. Navy in the year around ice-free shore between Sukkertoppen and Cape Farewell and Cape Brewster in the southeast which is ice-free from June to November.

3. As a source of weather information influencing air and naval operations in the North Atlantic, Greenland is most important.

IX. Conclusions:

1. Because of Soviet influence, that is, the fear existent in the Scandinavian Bloc of Soviet infiltration, and because of the revived nationalism of the Denmark Government, indications point to a closing of the door to U.S. activities in Greenland;

SECRET

this has undoubtedly been delayed by Denmark's lack of trained personnel and the vast expenditures involved in taking over the U.S. controlled weather and communications installations in Greenland.

2. There are indications that the U.S. will attempt to urge upon the Danish Government long term agreements in regard to air and naval bases in Greenland under sole jurisdiction of the U.S., together with such subsidiary services and outlying posts as may be deemed vital to national defence. This attitude indicates that the sale of U.S. equipment to the Danish Government will be postponed indefinitely.

3. The Danish attitude has been characterized, first, by her anxiety to assume weather control; second, by the refusal of Denmark to become a signatory of the Copenhagen Agreement; and finally, the intense opposition of the press in the Scandinavian Bloc to continued occupation of bases in Greenland by the U.S. However, there are late indications that the Danish Government would prefer a revision of the Defense of Greenland Agreement rather than an outright abrogation of it.

THE UNITED STATES MILITARY ACADEMY.

Officers of the United States Regular Army obtain their commissions in one of the three ways: by appointment to the United States Military Academy at West Point and qualification by graduation therefrom after a four year course of study and training; by appointment from civil life and qualification on examination; by appointment from the army and qualification on examination. Of the 12,241 commissioned officers authorized for the Regular Army today (1929), only about 3,600 on the active list obtained their commissions by the first of the methods enumerated above. This first class of officers is considered by military students a most important one, for by education and training the graduates of the United States Military Academy are equipped to set and to maintain the standards of the Service.

Historical Background of West Point, the Place.

Years before the Military Academy was established, West Point was the scene of stirring events. During the Revolutionary War, West Point was what is termed a key point—it controlled navigation on the Hudson River. Had the British forces that held New York been able to join hands with the British troops that pushed south from Canada, the colonists would have been cut in two and their fighting strength crippled. West Point thus became a strategic point of vital importance to the success of the American cause.

Early in the War, the Americans constructed Forts Montgomery and Clinton five miles below West Point at the mouth of Popolopen Creek, and Fort Constitution on Constitution Island across the river. These forts were intended to deny the British access to the Highlands west of here, for a short distance back in the hills, at the Forest of Dean Mine and other places, the Americans were turning out war

THIS PAGE IS DECLASSIFIED IAW EO 13526

supplies that were of great importance to General Washington's forces. The three forts, however, were poorly located, for they were so low that the defenders were at a disadvantage. In August, 1777, the British forces under Sir Henry Clinton captured these forts. The Highlands were thus exposed to invasion, but Arnold's timely defeat of the British forces under Burgoyne, at Saratoga, caused Clinton to abandon his expedition. After having occupied the territory as far north as West Point for a period of twenty days, Clinton's troops withdrew to New York. The Americans then realized that to defend the Highlands they would have to erect strong fortifications at West Point. In January, 1778, upon the recommendations of General Sterling and Governor Clinton, General Parson's brigade occupied West Point, and immediately began to build the fortifications. American troops have garrisoned West Point continuously ever since that date.

Navigation on the Hudson had to be controlled. The Americans determined to stop the passage of ships by stretching a heavy chain across the river, and to emplace batteries to protect the chain. The chain was made at the Sterling Iron Works, taken to the Hudson River near Newburgh, floated down the river on logs, and on April 30, 1778, anchored in place at the sharp bend in the narrowest part of the river between Constitution Island and West Point. Part of this historic chain is now among the relics on Trophy Point. So far as we know, it was never tested by the attempt of a British vessel to break through, for the strength of the West Point garrison and the growing fortifications disarranged the British plans for invasion.

Though the batteries to protect the chain were emplaced before the chain was stretched, little was accomplished on the other defensive works at West Point until Kosciusko reported for duty as engineer officer. Under Kosciusko the work started under General Putnam went vigorously forward. One of the forts, designed by General Putnam and later named in his honor, was quickly completed. It now

THIS PAGE IS UNCALSSIFIED

stands, as rebuilt in 1905 according to the original design, on the hill overlooking the Cadet Chapel. As a result of Kosciusko's untiring efforts, the fortification, now called Fort Clinton, on the northeast corner of the present cadet camp, was completed and garrisoned in June, 1778. It was originally named Fort Arnold in honor of General Benedict Arnold. Between the summer of 1778 and the spring of 1780, under Kosciusko's skillful guidance, the Continental forces completed the fortifications around West Point.

The summer of 1780 was a critical time in our history. British troop movements so clearly indicated an attack on West Point that General Washington ordered large numbers of troops to concentrate here to prevent the British from cutting off New England. The Americans were tired of war. The public treasury was empty. The Continental paper currency, always really worthless, had for a long time been kept near par by means of laws and bayonets, but it was rapidly depreciating. The ranks of the army were filled with youths who had been given a $1,500 bonus for a nine months enlistment. Because there were no public funds, hundreds of officers had exhausted their personal means to buy food and supplies for their men. These, and many other similar conditions, caused General Washington to say: "There has never been, throughout the war, a stage when public dissatisfaction had been so general and so alarming."

a. On page 2, 4th line, delete that portion beginning "In August 1777" and extending to the end of the paragraph, and substitute the following:

In October, 1777, a British force under Sir Henry Clinton captured these forts. The Highlands were thus exposed to invasion. Of greater import was the fact that, by that victory, the British had removed one of the most formidable obstacles to their control of the Hudson. Apparently, their plan of severing New England from the other colonies and then defeating the colonial forces in detail was on the brink of success. Clinton's forces were occupying the river territory as far north as West Point, and his advanced elements had carried out destructive raids as far north as Kingston. At that critical juncture, Gates' command defeated the British forces moving down from the north under Burgoyne to join hands with Clinton. Credit for that victory, Freeman's Farm, belongs to Benedict Arnold, whose leadership and driving initiative, turned a doubtful contest into an overwhelming British defeat. Burgoyne was forced to surrender at Saratoga, October 17, and the British plan collapsed. Clinton withdrew to New York.

The British effort had at last made clear to the Americans the necessity of properly defending the Highlands, and above all, of guarding West Point, key to control of the Hudson, with strong fortifications. In January, 1778, upon the recommendations of General Stirling and Governor Clinton, General Parson's brigade occupied West Point, and immediately began to construct strong defensive works. From that date to the present, American troops have continuously garrisoned West Point. (C., No. 1, B. H. B., U. S. M. A., 1931.)

stands, as rebuilt in 1905 according to the original design, on the hill overlooking the Cadet Chapel. As a result of Kosciusko's untiring efforts, the fortification, now called Fort Clinton, on the northeast corner of the present cadet camp, was completed and garrisoned in June, 1778. It was originally named Fort Arnold in honor of General Benedict Arnold. Between the summer of 1778 and the spring of 1780, under Kosciusko's skillful guidance, the Continental forces completed the fortifications around West Point.

The summer of 1780 was a critical time in our history. British troop movements so clearly indicated an attack on West Point that General Washington ordered large numbers of troops to concentrate here to prevent the British from cutting off New England. The Americans were tired of war. The public treasury was empty. The Continental paper currency, always really worthless, had for a long time been kept near par by means of laws and bayonets, but it was rapidly depreciating. The ranks of the army were filled with youths who had been given a $1,500 bonus for a nine months enlistment. Because there were no public funds, hundreds of officers had exhausted their personal means to buy food and supplies for their men. These, and many other similar conditions, caused General Washington to say: "There has never been, throughout the war, a stage when public dissatisfaction had been so general and so alarming."

The British were aware of this unrest. They saw that a successful blow upon the American Gibraltar at West Point might easily end the war. Moreover, Sir Henry Clinton, the British Commander, knew that the capture of West Point would checkmate the possibility of an American attack upon the British stronghold at New York. Through his adjutant, Major John André, he had for some time been getting information from an American who called himself "Gustavus." The value of the information furnished by "Gustavus" had led Clinton to surmise that his informant was none other than Major General Benedict Arnold. When Arnold, who had long sought command of the garrison at

THIS PAGE IS UNCALSSIFIED

West Point, was assigned, on August 3, 1780, to command the post, Clinton's plans matured rapidly.

Arnold's grievances, real and imaginary, had estranged him from the American cause. He was convinced that the Revolution could not succeed. The time was most propitious for decisive action. After Arnold assumed command at West Point, his correspondence with Major André became more rapid and regular; within five days he suggested that André meet with him to arrange the terms for the surrender of West Point.

The meeting was soon arranged. At night, in a sheltered cove on the west bank of the Hudson near Haverstraw, André and Arnold met, agreed upon terms, and completed the plans. Fortunately for the American cause, some American sympathizers accidently captured André at Tarrytown and, from papers in his possession, discovered that plot. André had by Arnold's orders removed his British uniform while he was within the American lines, so he was tried and later executed as a spy. Arnold fled to New York before his treachery became known, and got safely away to England. There he ended his days, shunned by the British and despised by the Americans for whom he had often risked his life in battle—a lonely, tragic figure whose brilliant career had been ruined by his treason. On his deathbed, Arnold had his wife bring his Continental uniform—all that remained to him of his former greatness. He died with the old uniform clasped in his arms.

From the time of Arnold's treason to the end of the Revolution, West Point remained securely in the hands of the Americans. As the war dragged on to its close, the action shifted to other scenes, and West Point was not again seriously threatened. It remained an important post, however, and at one time or another practically all of the famous Revolutionary generals served here.

We may judge what West Point was like in these early days by picturing the fortifications. Fort Putnam was the most imposing work. It was protected by a series of four strong re-

doubts on the hilltops to the southwest, and by Fort Webb and Fort Wyllys to the south. Fort Webb occupied the present site of the observatory; Fort Wyllys was on the ridge southeast of Lusk Reservoir dam. On the Plain, Fort Sherburne was on Trophy Point, and Fort Clinton on the site of the present summer camp. Near the river were three batteries; one near the north end of the present railway tunnel, one at Gee's Point, and one opposite where Memorial Hall now stands. At the southern end of the Post, near the present Cavalry Drill Ground, Fort Meigs completed the system. All of these forts, redoubts, and batteries were manned by detachments from the main garrison, which was encamped on the plain. Sentries guarded their posts, mounted couriers came and went with dispatches, supply wagons rumbled over the roads, and the troops daily performed their military exercises and drills. The West Point of those days was intensely alive and active.

After hostilities ceased, the final disposition of West Point was in doubt for some years. From a military viewpoint, its importance as a defensive position rapidly faded. The necessity for maintaining a strong garrison at West Point ended, and, in fact, soon became impossible, for after the war the American forces quickly disbanded. In 1780, General Washington established a small engineer school at West Point, where organization plans and gunnery experiments were tried out on the plain. Except for the small detachment stationed here in connection with this school, the place was deserted. By January, 1784, the army numbered less than 700 men; and in June of that same year Congress passed this illuminating bit of legislation: "......Standing armies in time of peace are inconsistent with the principles of Republican Governments, dangerous to the liberties of a free people, and generally converted into destructive engines for establishing despotism......the commanding officer is hereby directed to discharge the troops now in the service of the United States except twenty-five privates to guard stores at Fort Pitt and fifty-five to guard stores at West Point......"

THIS PAGE IS UNCALSSIFIED

The occupation of West Point during the Revolutionary War, and its continued occupation by the military forces thereafter, brought action by one Stephen Moore, of Caswell county, North Carolina, who was the owner of the land. After several years of claims for damages caused by the occupation of the site by the military, Moore petitioned the government, asking that the United States purchase West Point. Alexander Hamilton, Secretary of the Treasury, reported favorably on this petition June 10, 1790. Congress acted promptly on Hamilton's report, and by an Act approved July 5, 1790, authorized "to be purchased for the use of the United States the whole or such part of that tract of land situate in the State of New York, commonly called West Point, as shall be by him (the President) judged requisite for the purpose of such fortifications and garrisons as may be necessary for the defense of the same."

Thus did the place, West Point, come permanently into the possession of the government.

Legal Establishment of the United States Military Academy.

Even during these years when West Point was virtually abandoned by troops, plans were under way for the establishment of a national military school; and West Point, because of its historical associations and its natural advantages (according to the vision of the period) was the only place considered as a site.

These plans had long been under consideration. The earliest proposal for a national military school came from General Henry Knox, in May, 1776. His plans were indorsed by Colonel Alexander Hamilton and approved by General Washington. Later in the same year, a Congressional committee urgently recommended the establishment of a Military Academy, but Congress took no effective action. In 1783, after the end of hostilities, General Washington submitted recommendations which included a detailed plan for the establishment of a national Military Academy at West Point.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

In his presidential message to Congress in 1793, Washington again referred to this plan, and finally, in 1794, secured the passage of a law which created the legal basis on which the Military Academy was later formally established. This law created the grade of "cadet" in our army and provided for the instruction of cadets. For nearly twenty years General Washington had steadfastly supported the plan to establish a Military Academy, and he did more than anyone else to carry out that plan. The founder of the Military Academy was General Washington.

In 1794, the War Department established a small military school at West Point. The government paid for all books and other equipment necessary for the instruction of cadets. Though a fire in 1796 destroyed the school building, books, and equipment, instruction continued in another building. In 1798, Congress increased the number of cadetships to fifty-six and provided for the pay of cadets as follows, "cadets, ten dollars, and two rations per day"; and authorized the president "to appoint a number, not exceeding four, teachers of the arts and sciences necessary for the instruction of the artillerists and engineers." At this stage in the developnent of the Military Academy, Congress had authorized a school, but it had not specifically provided for school buildings or for assembling cadets at West Point. Only cadets attached to troops stationed at West Point attended the school. It soon became evident that the school needed further legislation to provide for regular and systematic instruction of all the authorized cadets.

An Act of Congress signed by the President on March 16, 1802, established the Military Academy as a permanent national institution. The pertinent sections of this Act read as follows:

> Sec. 26. And be it further enacted, That the President of the United States is hereby authorized and empowered, when he shall deem it expedient, to organize and establish a corps of engineers, to consist of one engineer, with the pay, rank and emoluments of a major; two assistant engineers, with the

pay, rank and emoluments of captains; two other assistant engineers, with the pay, rank and emoluments of first lieutenants; two other assistant engineers,-with the pay, rank and emoluments of second lieutenants; and ten cadets with the pay of sixteen dollars per month, and two rations per day; and the President of the United States is, in like manner, authorized, when he shall deem it proper, to make such promotions in the said corps, with a view to particular merit, and without regard to rank, so as not to exceed one colonel, one lieutenant-colonel, two majors, four captains, four first lieutenants, four second lieutenants, and so that the number of the whole corps shall, at no time, exceed twenty officers and cadets.

Sec. 27. And be it further enacted, That the said corps when so organized, shall be stationed at West Point, in the State of New York, and shall constitute a military academy; and the engineers, assistant engineers, and cadets of the said corps, shall be subject, at all times, to do duty in such places, and on such service, as the President of the United States shall direct.

Sec. 28. And be it further enacted, That the principal engineer, and in his absence the next in rank, shall have the superintendence of the said military academy, under the direction of the President of the United States; and the Secretary of War is hereby authorized, at the public expense, under such regulations as shall be directed by the President of the United States, to procure the necessary books, implements and apparatus for the use and benefit of the said institution.

The facilities sanctioned by the acts of 1794 and 1798 were now provided. This Act of March 16, 1802, provided the legislative fulfillment of plans that revolutionary patriots had fostered for the establishment of a national Military Academy.

Be it noted, however, that the institution above provided was purely a small engineer corps school. The "cadets" attached to the engineer troops were the only students in the new military academy. Other cadets, as those attached to the artillery, cavalry, and infantry, were not eligible for admission. The United States Military Academy had not yet begun to take its final form.

Early Years of the United States Military Academy, 1802-1817.

The "gentlemen cadets" who, under the legislation previous to that of 1802, had been studying at West Point became in that year absorbed into the newly authorized Military Academy, and continued their studies as before. Instruction was elementary and suffered from frequent interruptions, lack of regulation and lack of discipline. The handful of cadets could with difficulty be forced to apply themselves to their studies, which at that time included mathematics, fortifications, artillery, surveying, and French. The Academy was regarded as a scientific school for the education of future officers in the Corps of Engineers. Few of the authorized number of cadets had been appointed and many of those who were appointed failed to graduate. There were no entrance examinations, no age limit, no law that required cadets to attend the Academy, and no system in the government of the student body. In fact, the plans to create a real school for junior officers were pressed with so little vigor that by 1812 the Military Academy practically ceased to exist. Funds for the maintenance of the institution were not provided, the officer instructors were used for duties elsewhere, and cadets did not report, so that at one time in this year (1812) the Military Academy had neither instructors nor students.

Confronted by this situation, Congress, in an Act approved April 29, 1812, provided for the reorganization of the Military Academy. The pertinent provisions are as follows:

> Sec. 2. And be it further enacted that the military academy shall consist of the corps of engineers, and the following professors, in addition to the teachers of the French language and drawing already provided, viz: one professor of natural and experimental philosophy....one professor of mathematics... one professor of the art of engineering in all its branches.....; each of the foregoing professors to have an assistant professor, which assistant professor shall be taken from the most prominent characters of the officers or cadets.....
>
> Sec. 3. And be it further enacted, That the cadets heretofore appointed in the service of the United States, whether

> of artillery, cavalry, riflemen or infantry, or that may in future be appointed as hereinafter provided, shall at no time exceed two hundred and fifty: that they may be attached at the discretion of the President of the United States, as students to the military academy, and be subject to the established regulations thereof; that they shall be arranged into companies of non-commissioned officers and privates, according to the directions of the commandant of engineers, and be officered from the same corps, for the purposes of military instruction; that there shall be added to each company of cadets four musicians; and the said corps shall be trained and taught all the duties of a private, non-commissioned officer, and officer; be encamped at least three months of each year, and taught all the duties incident to a regular camp: that the candidates for cadets be not under the age of fourteen, nor above the age of twenty-one years; that each cadet, previously to his appointment by the president of the United States, shall be well versed in reading, writing, and arithmetic, and that he shall sign articles, with the consent of his parents or guardian, by which he shall engage to serve five years, unless sooner discharged; and all such cadets shall be entitled to and receive the pay and emoluments now allowed by law to cadets in the corps of engineers.
>
> Sec. 4. And be it further enacted, That when any cadet shall receive a regular degree from the academical staff, after going through all the classes, he shall be considered as among the candidates for a commission in any corps, according to the duties he may be judged competent to perform:........
>
> Sec. 5. And be it further enacted, That the sum of twenty-five thousand dollars be, and the same is hereby appropriated, to be paid out of any money in the treasury not otherwise appropriated, for erecting buildings, and for providing an apparatus, a library and all necessary implements, and for such contingent expenses as may be necessary and proper, in the judgment of the President of the United States, for such an institution.

Even this legislation failed to accomplish much good. It is important as a great step toward changing the young institution from a purely engineer school into an academy for all branches of the service, and as a step toward indicating

the nature of the final organization. Real leadership was necessary, however, to make these provisions effective.

The Superintendency of Colonel Sylvanus Thayer.

Up to 1815 one of the many difficulties that beset the youthful Military Academy was administration. By law, the chief of the Corps of Engineers was the Superintendent. As he was often necessarily on duty elsewhere, the senior engineer officer at West Point was left to carry out the policies of his chief. The awkwardness of this arrangement interfered seriously with the smooth running of the Academy. In 1815 the War Department established the position of Superintendent as a separate office. The order that put this change into effect prescribed that the Superintendent should reside at West Point, and that no officer senior to him should be assigned to duty at the Academy.

Under this order, the first Superintendent appointed was Brevet Major Sylvanus Thayer. He was a graduate of Dartmouth College, a graduate of the Military Academy, had served through the War of 1812; and, at the time of his appointment, had recently returned from studying military schools in Europe. His breadth of vision, human sympathy, knowledge of educational purposes and methods, and enthusiasm, all contributed to qualify him for his new appointment. He assumed the Superintendency July 28, 1817.

Immediately after he became Superintendent, Major Thayer organized the Corps of Cadets into a two company battalion with suitable cadet officers. Within a year, he created the office of Commandant of Cadets, and appointed a tactical instructor to that position. Shortly afterwards, Major Thayer had all classes divided into small sections for academic instruction, inaugurated daily marks and weekly reports of marks, and established the system of transferring cadets to higher or lower sections according to their demonstrated ability. He started the arrangement of cadets in relative rank according to class standing. In the sixteen years that he

was Superintendent, Major Thayer made the struggling young school into a world famous institution.

His measures produced notable changes in the Corps of Cadets. Previously, cadets lived much as did their friends in civilian institutions. Military discipline had troubled them very little. As a result of the regulations Major Thayer enforced, the cadets organized a committee to defend what they considered their rights. They were apparently determined to take a hand in the management of the Academy. Major Thayer finally had several cadets tried by court-martial for insubordination. Upon the completion of the first case, someone questioned the right of a court-martial to try a cadet. After much deliberation, the court decided that it had no jurisdiction over cadets. It looked for a while as though the cadets would win their point, but the Attorney General ruled that the Corps of Cadets formed a part of the land forces of the United States, and that cadets were subject to the Articles of War and to trial by court-martial. President Monroe confirmed this ruling, and it has been in effect ever since. As soon as the cadets realized that they were really part of the Army, they had no grounds for disregarding Army discipline. Thus Major Thayer was responsible for establishing the high standard of discipline of which West Point is now justly proud.

One accomplishment of Colonel Thayer deserves special mention. In the early nineteenth century, educational institutions of the country centered their attention almost exclusively upon training young men for the ministry or for the practice of law. Colonel Thayer made of the Military Academy a scientific college which was then almost alone in its field in America, which provided trained engineers for the engineering problems of the rapidly growing country, and which held this preeminence until recent times. He should be remembered not only for his lasting influence on the Military Academy, but also as one of the outstanding pioneer educators in the history of our country.

The United States Military Academy, 1833-1866.

July 1, 1833, Colonel Thayer, after sixteen years as Superintendent, was relieved. His work at West Point was finished. In perspective today the student at West Point realizes how well it was done. The principles of organization, training, discipline, and teaching which he inaugurated have served ever since as the guiding forces in the progressive development of the institution. He stands today as the "Father" of the Military Academy.

Few noteworthy changes in the organization and regulations of the Military Academy occurred in the years immediately following Colonel Thayer's relief. By an Act of Congress approved July 5, 1838, provision was made for a Professor of Chemistry, Mineralogy, and Geology, and also for cadet engagement to serve eight years instead of five. And by an act of Congress approved March 1, 1843, new regulations were provided for cadetships, as follows:

> Provided, That hereafter in all cases of appointment of cadets to the West Point Academy, the individual selection shall be an actual resident of the congressional district of the State or Territory, or District of Columbia, from which the appointment purports to be made: And provided further, That the number of cadets by appointment hereafter to be made, shall be limited to the number of representatives and delegates in Congress, and one for the District of Columbia, and that each congressional and territorial district and District of Columbia, shall be entitled to have one cadet at said academy: Provided, That nothing in this section shall prevent the appointment of an additional number of cadets not exceeding ten to be appointed at Large, without being confined to a selection by congressional districts.

The first test of the product of the Academy and evidence of its value to the United States came with the outbreak of the Mexican War. At this time about 1300 cadets had graduated from the Military Academy. Over 500 graduates were on active duty in the Regular Army, and many more who had gone back to civil life promptly joined the volunteers. Cadets who were about to graduate had a new rumor every day on

0213

THIS PAGE IS DECLASSIFIED IAW EO 13526

the possibility of early graduation and the prospects for immediate active service abroad. Though many graduates had risen from the junior grades, there were, in 1845, no graduates among the general officers. Long years of intermittent warfare with the Indians on our western frontier, however, had given our officers practical training which well fitted them to handle larger forces, and to assume heavier responsibilities in the Mexican War. They led their men through thirty successive victories which resulted in the capture of 40,000 prisoners, 1,000 cannon, and immense quantities of war material. These victories extended from California through the northern states of Mexico to the mouth of the Rio Grande, and from Vera Cruz to Mexico City. In a brief but brilliant campaign, they overcame tremendous obstacles. Neither deserts, nor mountains, nor rivers could stop them. Lack of men, food, clothing, cannon, or ammunition seemed only to spur them on to greater efforts. They won against seemingly hopeless odds and against greatly superior numbers of the enemy. Indomitable spirit and a thorough knowledge of their profession were responsible for their success. Their years of training at the Military Academy and in the Indian Wars had not been wasted. The list of graduates who were brevetted for gallant services runs into the hundreds; many were brevetted for gallant services two or even three times. Among those who rendered conspicuously distinguished services were Robert E. Lee, Bragg, Sherman, Sumner, Hooker, Beauregard, and McClellan, all of whom later rose to high commands in the Civil War.

The able leader of the expedition that captured Mexico City, Major General Winfield Scott, though not himself a Military Academy graduate, paid a fine tribute to the West Pointers of his command, in a letter written in 1860, in which he said: "I give it as my fixed opinion, that but for our graduated cadets, the war between Mexico and the United States might, and probably would, have lasted some four or five years, with, in its first half, more defeats than victories falling to our share; whereas, in less than two campaigns, we con-

THIS PAGE IS DECLASSIFIED IAW EO 13526

quered a great country and a peace, without the loss of a single battle or skirmish."

The notable services rendered by the Military Academy graduates in the Mexican War demonstrated to the nation the wisdom of increasing the output of the Academy. Congress appropriated generous sums for new buildings, increased the staff of professors by the addition of Professors in Drawing and French (1846) and in Spanish (1857), and displayed its interest in the welfare of West Point by sending a Board of Visitors to inspect it each year. With improved facilities, the Academy resumed its task of preparing leaders for the next war.

In the unsettled years that immediately preceded the Civil War, cadets faced serious problems. They knew that a break in the Union would split the Corps, that men who were classmates might soon meet as enemies in battle. When war was declared, 65 cadets from Southern States resigned and cast their lots with the Confederacy. The cadetships thus vacated were at once filled by men from the Northern States. Though two classes graduated in 1861, as a result of changing from a five year course to one of four years, no class graduated during the Civil War with less than four years cadet service. The Military Academy continued its regular training despite the fact that the country was torn by civil warfare.

In the Union Army, at the beginning of the war, many of the regimental commanders were West Point graduates, but there were no graduates among the general officers. Within six months, the Federal government realized the seriousness of the conflict, and adopted the policy of appointing as generals those officers who demonstrated their ability to command troops in battle. As a result, within a year two-thirds of the higher commanders were West Pointers, and this proportion was fairly well maintained throughout the war. After nearly four years of war, in January, 1865, all the general officers of the line were graduates. The total number of graduates who rose to the rank of general in the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

Union Army was nearly 300. In the profession of arms, as in any other profession, training counts heavily.

The Confederate States had to create an army. They turned unhesitatingly to West Point men. Jefferson Davis, President of the Confederacy, was a graduate who had served with distinction in the Regular Army. He knew personally many of the 296 West Point graduates who served actively in the Confederate Armies. Over half of these officers (151) became generals in the Southern forces. The magnificent struggle waged by the South, with success in the early stages, and against overwhelming odds towards the end, is largely attributable to the skillful military leadership displayed by these officers. The names of Stonewall Jackson and Robert E. Lee will live long in the annals of war, and though they fought in a cause which we now recognize as a hopeless one, they showed that they could fight as few men have fought before or since. Here again we see that, given the material, West Point can produce great leaders.

At the end of the Civil War, West Point graduates were at the heads of the opposing armies. In every major engagement throughout the war, the forces on at least one side, and often on both sides, had been commanded by West Point graduates. Each of those men took something of the West Point spirit into battle with him; each one contributed something to the traditions that West Point stands for today. Read the lives of these men, study how they thought, what they did, and how they learned to command others. They have set a high standard for those who follow in their footsteps.

After the war was over, Congress recognized the fact that the Military Academy had long since ceased to be merely an engineering college and had been training officers for all branches of the service by passing an Act, approved July 13, 1866, providing (Sec. 6):

> That the Superintendent of the United States Military Academy may hereafter be selected, and the officers on duty at that institution detailed, from any arm of the service; and

THIS PAGE IS DECLASSIFIED IAW EO 13526

the supervision and charge of the Academy shall be in the War Department under such officer, or officers, as the Secretary of War may assign to that duty.

In the same year, legislation fixed the age for admission of cadets at between seventeen and twenty-two years, provided for designation of alternate candidates by the appointing powers, and added English grammar, descriptive geography, and United States history to the entrance requirements.

The Spanish-American War, 1898.

For over thirty years after the close of the Civil War, no great war involved the United States. During this period, however, practically all of the Regular Army units took part in one or more of the numerous Indian Wars. As few civilians felt the immediate effects of these wars, they knew little of the arduous service rendered in isolated army posts on the western frontier. The next great test, which again turned public attention on West Point, came in the Spanish-American War.

Here at the Military Academy, this war changed early graduation from rumor to fact. Because of the shortage of trained officers, many instructors were relieved and sent to duty with troops; the class of 1898 graduated about two months ahead of schedule, and the class of 1899, nearly four months early. Despite these changes, West Point maintained its customary high standard of training and discipline.

In April, 1898, all the Regular regiments that could be spared from their stations, concentrated at the general mobilization camps in the South, in preparation for operations in Cuba. Within a few months, by the enlistment of volunteers our small Regular Army of 26,000 men expanded to 223,000. Most of the officers selected to command these raw recruits came from the 1800 Military Academy graduates who saw active service. Actual hostilities lasted only a short time. Then the volunteer forces clamored for release from active service, and the bulk of the volunteer forces soon melted away. The tedious work of establishing stable government

THIS PAGE IS UNCALSSIFIED

in territory freed by the War from Spanish control, fell mostly upon the Regulars. In Cuba and in the Philippines, officers became the actual governors of towns, districts, provinces, and larger territories. In Cuba, Generals Bliss, Ludlow, and Fitzhugh Lee, and in the Philippines, General Francis Vinton Greene distinguished themselves not only as soldiers, but also as able executives and administrators. All of them were West Point graduates. The thoroughness and zeal with which these officers and their subordinates performed their civil administrative duties helped materially to establish promptly stable government. By their constructive work in an unfamiliar field, they added fresh laurels to West Point traditions. In 1899, Elihu Root, then Secretary of War, reported upon the Military Academy as follows:—"I believe that the great service which it has rendered the country was never more conspicuous than it has been during the past two years. The faithful and efficient services of its graduates since the declaration of the war with Spain have more than repaid the cost of the institution since its foundation."

The World War, 1917.

The World War caused an upheaval at West Point. All the instructors who could possibly be spared were relieved and sent to duty with troops. The remaining instructors did double duty here during the winter, and then spent the summers in the training camps for officers. The Class of 1917 graduated about two months ahead of time; many of its members at once joined organizations that were under orders to embark for France. Other classes graduated in quick succession; 1918, nine months early; 1919, twelve months; 1920, twenty-four months; and 1921 about thirty-two months ahead of schedule. On November 2, 1918, the Corps of Cadets consisted of the members of the Fourth Class. They had been at the Academy but four and a half months when they had to shoulder the responsibility for maintaining the traditions that had been handed down for over an hundred years. The War Department determined to change West

Point into a training school which would turn out a class of officers each year, and had the war lasted, it is probable that West Point would have fallen into line with the training camp methods. As soon as the Armistice went into effect, however, the pressing need for officers ceased. Congress upon the advice of General Pershing provided for the reestablishment of the full four year course. The Class of Cadets that entered in July, 1919, graduated in 1923, and since that date the Corps has resumed much the same character that it had before the World War.

When the United States declared war on Germany, on April 6, 1917, our Regular Army was being enlarged and reorganized. As a result of its expansion, even the Regular Army units were under-officered. The immediate demand for trained officers was overwhelming. Every National Guard Regiment needed at least one Regular Army officer to help train the troops. All the training camps for candidates who sought commission had to be built, the training had to be improvised, the courses to be conducted before this country could begin to mobilize the bulk of its man power. Then the National Army divisions had to be drafted, organized, equipped, trained, and carried over to France, before our efforts began to count on the firing line. We had millions of men, but they were almost entirely untrained. We soon had thousands of officers who had received but little more training than the troops they commanded. The tremendous burden of directing our belated preparations for war fell most heavily upon the Regular Army officers—the men who had spent their lives in the service and knew something about the business of war.

During the World War, 3,445 graduates of the Military Academy saw active duty. From the most recent graduate to those who had long experience in the army, all had to assume much heavier responsibilities than ever before. It was not unusual for an officer 24 or 25 years old to command a battalion of a thousand men. Older graduates commanded tens and hundreds of thousands. At the end of the war, West

Point graduates held practically all of the high positions in our army. General John J. Pershing, class of 1886, was the Commander in Chief of our forces in France; General Peyton

b. On page 20, 2d line from bottom of page, delete that portion beginning "Notwithstanding the fact" and extending to the end of the paragraph, and substitute the following:

West Point's share in the national effort for victory is strikingly evidenced by a full analysis of the record of battle casualties. It is not sufficient in such an appraisal to accept the bare statistics on battle deaths per thousand combatants, as given in the report of the Central Records Office. That report indicates that among enlisted men battle deaths were 24.5 per thousand; among emergency officers 22.6 per thousand; among regular officers (including West Point graduates) 22 per thousand; among West Pointers 20 per thousand.

A true picture appears only on examination of the facts behind these statistics. In the war-time expansion of the Army, the officer quota was raised from approximately five thousand to an ultimate total of more than two hundred thousand. Inevitably the requirements of high command and staff absorbed the bulk of the trained regular officers. To get a valid comparison we must then look to the casualty record of junior officers, those whose duties placed them in immediate contact with the enemy. These officers, from lieutenant to major, make up a group roughly comparable to the enlisted man as to age (31 or under), and as to hazards met in their war experience. The losses among officers of these grades for the entire A. E. F., whether on staff or troop duty, were as follows (per thousand):

Emergency Officers	Regular Officers (non-graduates)	West Point Graduates
21.5	25.6	41.9

Similar statistics for the grades of lieutenant-colonel and colonel are as follows:

All Classifications		Regular Officers (non-graduates)	West Point Graduates
*Colonels		5.7	7.2
Lt. Colonels	6.4	9.8	11.63

Perhaps the most eloquent record is that showing the losses by grade among battalion officers:

	Emergency Officers	Regular Officers (non-graduates)	West Point Graduates
Majors	6.4	16.0	20.9
Captains	11.5	25.1	54.0
1st Lieuts.	30.3	29.2	195.0

No mention is made of second lieutenants in view of the fact that as far as can be ascertained, no graduate second lieutenant reached France in time to participate in battle. (C., No. 1, B. H. B., U. S. M. A., 1931.)

*No data obtainable.

officers for responsible positions. The stern necessity for the best leaders that the Nation can produce limits the award of high commands to men of demonstrated ability. The fact that so great a proportion of West Point graduates demonstrated ability which led to high command, is a tribute to the training they received at West Point. The World War put West Point to the severest test it has ever had to meet. By meeting the test successfully, our graduates established this institution more firmly than ever in the esteem of our people.

Point graduates held practically all of the high positions in our army. General John J. Pershing, class of 1886, was the Commander in Chief of our forces in France; General Peyton C. March, class of 1888, as Chief of Staff, held a correspondingly important position in the United States. General Liggett commanded the First Army, General Bullard the Second Army, and General Dickman the Third Army. All three were West Point graduates. Of the 38 corps and division commanders who had command in France at the end of the war, 34 were West Pointers. Most of the senior staff officers of the units in France, and the heads of practically all of the great supply and administrative branches in the United States, were West Point graduates. Notwithstanding the fact that West Point was called upon to furnish the higher leaders, and a large number of staff officers, still it took its full share of the battle casualties. The final report of the Central Records Office, A. E. F., shows that among enlisted men battle deaths were 24.5 in each thousand; among emergency officers they were 22.6 in each thousand; among Regular officers they were 22 in each thousand (including graduates U. S. M. A.); and among West Pointers they were 20 in each thousand. The facts about casualties may be summarized by stating that they were about the same among officers as among enlisted men, and about the same among Regular and Emergency officers. They were higher in the Infantry than in any other branch of the service.

In a war of the magnitude and duration of the World War, politics and favorites have little to do with the selection of officers for responsible positions. The stern necessity for the best leaders that the Nation can produce limits the award of high commands to men of demonstrated ability. The fact that so great a proportion of West Point graduates demonstrated ability which led to high command, is a tribute to the training they received at West Point. The World War put West Point to the severest test it has ever had to meet. By meeting the test successfully, our graduates established this institution more firmly than ever in the esteem of our people.

Comparison of Military School Systems of England, France, Italy, Germany and Spain With That of America.

ITALY.

Instead of one military academy such as we have in America, Italy trains young men for the profession of arms at the following military schools:

1. Military Academy for Infantry and Cavalry at Modena.
2. Military Academy for Artillery and Engineers at Turin.

In addition, there is the Royal Military College in Rome which is in the nature of a preparatory school and acts as a feeder for both of the military academies referred to above.

As in our service, after cadets have graduated from both of the above military academies, they specialize in the various schools of the branches and schools of application for the various arms.

In the *Royal Military College at Rome* which acts, as stated, as a reservoir for students for the military academies, the cadet corps numbers 350 and is composed of boys whose fathers were killed during the war, without consideration of the rank of the father so killed. The age of entrance is fourteen, and generally that of graduates is eighteen. The course is four years and cadets live under very strict military discipline. The corps is organized into a battalion of three companies, each company having officers of the regular army for its captain and lieutenant. Non-commissioned officers are selected from the cadet body. It is not obligatory, of course, for graduates of this academy to attend the military academies at Turin and Modena.

Military Academy for Infantry and Cavalry at Modena.

This academy is intended to provide officers for Infantry and Cavalry and would correspond to a divided West Point, so to speak, if we separated our training. The cadets ad-

THIS PAGE IS DECLASSIFIED IAW EO 13526

mitted to this academy enter from civil life with a certificate of lyceum or a technical institute. A small minority come from the Royal Military Academy in Rome. The course is for two years, at the close of which time they are graduated as second lieutenants. Immediately upon graduation, those assigned to the Infantry go to the school of application for Infantry at Rome and those for Cavalry at Pinerolo. The cadet corps is organized into a battalion of three companies in which the cadets are subject to rigid military discipline, having sleeping and messing quarters as at West Point. The arrangement of the rooms, however, is different, as cadets sleep in dormitories.

With the exception of instructors in modern languages, all of the instructors and officers detailed to the battalion are regular army officers chosen from the military general staff, Cavalry and Infantry. The course is similar to that at West Point except that the entrance requirements are higher. Much of the elementary work done at West Point is omitted. However, higher mathematics, differential and integral calculus, and civil engineering are omitted from the course. One striking difference between West Point and this school is that, in addition, a school is maintained for non-commissioned officers who desire to become officers. They are known as "aspirants". If they are successful, they follow a separate two year course which is distinct from that of the academy course, at the end of which they are immediately commissioned. In other words, it acts also as a preparatory school for soldiers who desire to become officers.

The course embraces military art, including tactics, logistics, organization, political and military history, military geography, arms and fire, material and supply, topography, field engineering, social science and law, military hygiene, administration and accountability, hippology, equitation, and modern languages (optional). Naturally, all officers are required to take a thorough course in equitation and they are also given an excellent course in fencing and gymnastics. The time is sub-divided, one-half devoted to subjects mentioned above,

and the balance to practical work. The school buildings are well adapted for their purpose and ample provisions are made for school rooms, gymnasium, etc., but for the practical exercises, the students maneuver at a distance of ten miles from the location of the academy.

Military Academy for Artillery and Engineers at Turin.

This academy provides officers for the Engineers and Artillery as does West Point for our army. The instructors are of two classes, civil and military. The civilian instructors are graduates of universities and instruct in what may be termed the purely civil subjects, such as mathematics, physics, languages, etc. Military instructors are used for engineering, military history, military law, etc. In addition, there is a group of officers which corresponds to our Tactical Department who are charged with purely military instruction. Officers of the cadet corps and all cadet officers are taken from the general staff, Engineers and Artillery.

The cadet corps numbers about 400 students, organized into a battalion of three companies. They live in barracks much as do our soldiers and are under rigid military discipline. The course is for three years, but in order that the graduates may be placed on a parity with the officers of the Infantry and Cavalry who graduate at Modena at the end of two years, the graduates of the Artillery and Engineers School are credited with a year's service upon graduation. The entance age is the same as at West Point, from seventeen to twenty-two.

The cadets are drawn either from civil life after passing an examination or from the military academy at Rome or at Naples. In either case, however, they must hold a diploma as a graduate of the lyceum or technical institute. The following subjects are taught: Higher mathematics, analytical geometry, mechanics, descriptive geometry, military history, ordnance, field fortifications, theory of analysis, topography, military letters, physics, general and applied chemistry, descriptive geography, theory of law, French, drawing,

both mechanical and free hand, panoramic sketching, architectural drawing, and German.

FRANCE.

In France there are two schools which are maintained by the government for taking young civilians and preparing them for commission as does West Point. They are:

Ecole Speciale Militaire, at Saint Cyr. 2 year course.
195 men in the 1st year class.
185 men in the 2d year class (these will graduate and be commissioned as Second Lieutenants).

Ecole Polytechnique, at Paris.
2 year course:
416 men in the 1st year class.
671 men in the 2d year class.

While the men at both Saint Cyr and Polytechnique are commissioned Second Lieutenants immediately upon graduation, they do not go to duty with troops as normally do West Point graduates, but go at once to the Schools of Application of their respective branches of the service where they specialize, usually for two years more.

The graduates of the Ecole Polytechnique pass not only into the army but also into:

Service of Powders and Explosives
Naval Construction Service
Naval Engineering Service
Corps of River and Harbor Engineers
Service of Roads and Bridges (Home and Colonial)
Service of Mines (Home and Colonial)
Ministry of Posts and Telegraphs
State Water and Forestry Service
State Manufacturing
State Railways
etc.

At Saint Cyr candidates are accepted between the ages of seventeen and twenty-three, and they agree to remain officers of the army for six years after graduation. In the Ecole

Polytechnique, they are accepted up to twenty-two years of age and they agree to accept any duty that may be offered upon graduation and also agree to remain in the army for six years after graduation. The graduates of Saint Cyr go either into the Infantry or Cavalry, whereas the graduates of the Ecole Polytechnique go into the Engineers or Artillery or into some one of the numerous govermental activities.

The course is two years at each school and the graduates, in the order of their class standing, choose assignments to the various services. Actual assignments, however, remain dependent upon the actual vacancies existing at the time.

For the Ecole Polytechnique, the candidates must be native or naturalized Frenchmen, possessing certain educational qualifications. Admission to this academy is based on the results of annual competitive examinations by which the Ecole Polytechnique acquires only the élite of the nation's intellectual youth.

In addition to training officers for the Infantry and Cavalry, Saint Cyr trains officers for the Tank Corps and for the Air Corps. To be eligible one must be a French citizen, native or naturalized, and candidates are admitted by competitive examination if they have finished the first part of their elementary course, and are between the ages of seventeen and twenty-two. The course covers general military instruction, tactics, history, geography, topography, applied science, firing, engineering, legislation, administration, modern languages, and practical military training such as physical training, fencing and riding. Contrary to West Point, students are required to pay for their expenses, which are approximately as follows: their living expenses are 1400 francs per year, and the cost of their uniforms is approximately 2500 francs for the two years.

The Ecole Polytechnique, as stated, provides engineers for different government services and officers of the army, as well as artillery officers. A few of these graduates also enter the navy. The course is for two years, is essentially

scientific and covers principally descriptive geometry, analytical geometry, mechanical drawing, astronomy, physics, chemistry and art. As at Saint Cyr, students are required to pay for their board and lodging, about 1400 francs, and for their uniforms 3360 francs for the two years. Foreigners may be admitted either as auditors living outside the school and paying no fees, or as students living in dormitories.

GERMANY.

System of Training Candidates for Commissioned Officers in the Army.

No military academy, such as ours at West Point, exists in Germany for training candidates for commissioned officers in the army.

Candidates for commissioned officers are obtained from the ranks and are required to have certain prescribed basic educational requirements upon entering the army and in addition to have at least two years' service as an enlisted man.

Training consists of a one year's basic course for all candidates at the Infantry School at Dresden, upon completion of which a second year's course is required at the branch school corresponding to the arm of the service in which the commission is desired, before being commissioned as an officer in the army.

Information at hand indicates that the Minister of National Defense intends to supplement further the instruction given in these basic schools by sending the candidates for a year's course to some university or in a technical high school.

SPAIN.

The professional and tactical training of candidates for officers of the Spanish Army is organized along the following lines:

There is a general military school at Zaragoza which is maintained to train officers who desire to enter the Infantry, Cavalry, Artillery, Engineers, and Quartermaster Corps, after passing a prescribed examination. Civilians, enlisted

THIS PAGE IS DECLASSIFIED IAW EO 13526

men, and reserve officers are eligible. Candidates, whether enlisted men, civilians, or reserve officers, must be educated and possess a bachelor's degree from a preparatory school for superior studies. Civilians must be between the ages of seventeen and twenty-two, and enlisted men must not exceed twenty-five and reserve officers likewise. In order to compete, candidates are examined in the following subjects: Mechanical analysis of the Spanish language, French, Italian, German or Portugese, elements of topography, panoramic drawing, art, algebra, geometry and trigonometry. The examinations for entrance are held yearly and open to the nation.

Instruction at the general military college is divided into two courses of one year each. Upon graduation, cadets pass into a special academy at which they continue their studies, depending upon the arm which they have chosen. The course of study at the special academy is for three years during which the student will perfect himself in the particular training of the arm of the service which he has chosen.

The system in Spain is entirely different from that in France and in Italy, and in our own country, apparently based upon a different conception of military education and no doubt due to local conditions.

ENGLAND.

In England there are two schools of application for officers of the British Army. There is a Royal Military College at Sandhurst for the preparation of candidates for Cavalry, Infantry, Royal Tank Corps and Royal Air Corps of the British and Indian Armies. The Royal Military College at Woolwich similarly prepares candidates for commissions in the Royal Artillery, Royal Engineers, Royal Signal Corps of the British Army.

The Royal Military College at Sandhurst has reservations for about 500 in attendance. The Royal Military College at Woolwich has reservations for about 250 cadets. Slightly

THIS PAGE IS DECLASSIFIED IAW EO 13526

less than one-third of these numbers are graduated every six months.

Qualifications: The cadets at both colleges must be unmarried British subjects of European descent between the ages of eighteen and nineteen at entrance. A certain number of Indian cadets are allowed and special cadets are admitted from Egypt, Iraq, and Siam. The entrance requirements are covered by British and Colonial schools, but special preferences are given to sons of army officers and of the Royal House, known as King's Cadets. Non-commissioned officers of the Royal Army are admitted as a result of competitive examinations allowed each six months.

All cadets appointed to the two military colleges must stand competitive examination prior to entrance for the purpose of establishing order of merit.

Extent of Course: Both schools run for eighteen months, divided into three terms known as junior, intermediate, and senior terms. The terms run from about the 1st of February to the 15th of July and from September 1st to December 15th, vacations being allowed between courses.

Unlike the cadets at West Point, who are maintained by the United States Government, the cadets at Woolwich and Sandhurst must pay their tuition fees which normally amount to $1,000 a year. The cost of uniforms and incidental fees amount to about $325 at the time of entrance and $75 at the end of the first year. Reductions in these amounts are allowed a certain class of candidates, such as sons of officers and the King's cadets. In 1927 the Woolwich Academy received about $600,000 for the maintenance of 240 cadets, or about $2,500 a year for each cadet. The authorities collected from the parents about $160,000. Sandhurst is more liberally endowed with about $1,115,000 for the average attendance of 540 cadets.

THE WEST POINT MAN AS RHODES SCHOLAR

By Lieutenant Charles E. Saltzman, *Maryland and Magdalen*, '25.

The old saying "nothing new under the sun" has received a good many blows in these times, and it stood a mild but definite shock four years ago when the first Rhodes Scholars from West Point were elected. The United States Military and Naval Academies have always been classed among the universities and colleges of the country and therefore cadets and midshipmen had previously been Rhodes Scholarship possibilities, but it was not until some West Pointers happened actually to be appointed that friends of the scholarships, the Military Academy, and education in general envisaged the fact that these selections introduced a new departure with elements and circumstances which had never been involved with scholars from civilian institutions. It was also realized at the same time that not only an innovation but an experiment was initiated when recently graduated young "shavetails" were to be sent to England.

This article is written in the belief that it might be of interest to readers of the "Oxonian," if one of the first batch of Rhodes Scholars from West Point would sketch the salient features which the experiment held for him. I am aware that it is impossible for anyone who has just completed his three years at Oxford to estimate the permanent influence or the ultimate effect which that period will have upon his life and thoughts, but he can nevertheless describe the reactions which were produced as he went along by a succession of new conditions and judge the immediate effect of the scholarship upon himself and his companions as indicated by impressions and trends of thought which were stimulated. Backsight is much more lucid than foresight, however less comforting, as the person who explores an unblazed trail is certain to learn. At the end of three years at Oxford not only am I impressed by many interesting, valuable, and delightful experiences which I was privileged to enjoy, but also I am struck by the seemingly boundless opportunities which the scholarship offers all its lucky participants, opportunities most of which reveal themselves but slowly to the none too imaginative novice who is feeling his way through a strange place. Writing from the viewpoint of a West Pointer, one would like not so much to outline what the experiment did mean to him as to indicate something of what it could mean and to designate some of the directions in which various opportunities lie.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

The first impression, the most striking or really staggering one which the West Pointer will receive upon arriving at Oxford, is that of contrast. Contrast is the first surprise, it is true, that greets every American who comes to Oxford, but it seems that the opposition of corresponding elements of system, procedure, customs, and living conditions is more sharply defined and deeply felt in the case of men from West Point or Annapolis than in those of scholars from American civilian institutions which, although very different from Oxford, are not so completely a world apart as are the two service academies. Not only does the recently graduated cadet, in company with other Rhodes Scholars from other institutions, find himself suddenly forced willy-nilly to forsake his inherited beliefs regarding language, food, social customs, architecture, rules of the road, table manners, and cigarettes and to adjust himself to a new university organization and a strange, puzzling collection of undergraduate customs and traditions, but he must at the same time fit himself into certain conditions which are antipodal to those under which he was trained at West Point. His adaptability will be taxed rather severely, particularly during the first term or two, but any suffering entailed will be in the form of growing pains, inevitable when certain parts of an organization are cultivated for the first time and develop rapidly. I believe firmly that these contrasts with which the young officer must cope provide an uniquely valuable aspect of the scholarship for him, because his adjustment to them requires him to develop sides of his mind, character, and personality which have not heretofore been given an opportunity to grow.

Among the conditions of Oxford undergraduate life which provide novelty for a West Pointer, that of freedom is prominent. He dreams of the four years at West Point, welcomes it with outstretched arms, and then finds to his amazement that he doesn't know what to do with it. At West Point he had next to none. For a certain purpose upon which we shall touch later, he was required to be in a certain place at a certain time to do a certain prescribed thing during most of the twenty-four hours. Now at Oxford he is master of time, place and, within his means, even of money. He loves it, but it is a large order at first. When, however, he will have learned to organize his time intelligently so that he knows what to do and when to do it, he will already have the ability, developed by his military course, to utilize the time thus planned to good advantage.

While comparing the freedom of Oxford to the restrictions of

cadet life, the West Pointer will mark the opposition of the Oxford systems of instruction and undergraduate life with those under which he was nurtured at the Military Academy. The systems of instruction at the two institutions share the virtue of dealing with small groups of students at a time and accordingly providing attention to the individual, but otherwise their purposes and methods diverge widely. The West Point system, which has become one of the most deep-rooted of our national traditions, has arisen from the fundamental mission of the Military Academy, a mission so vital to the United States that all parts of the West Point course must contribute to its accomplishment and be designed with that in mind. Our system of national defense provides for a normal establishment of only a small standing army and it is therefore imperative that there always be in that small force a highly trained, thoroughly reliable officer personnel upon which the country can absolutely rely in the event of a national emergency to carry energetically and efficiently the brunt of training and disciplining a large national army. Hence the mission of West Point is essentially to instil into its cadets such qualities of mental and moral discipline as will best insure a trustworthy and uniform nucleus for the task I have mentioned and at the same time to give a basic general university course which will provide a foundation for whatever sort of specialization the officer may later wish to develop in his particular branch or line of work.

Obviously there is a limit to the scope and amount of work which can be assimilated in four years, even four years of bugle calls, and so it is inevitable that certain limitations are imposed upon field of study, methods of instruction, and cadet life by the fact that the most thorough fulfillment of the fundamental mission of the Academy must rightly be the paramount, deciding consideration. Thus rigid discipline, order, precision, and strict adherence to detailed regulations are made the basis of all phases of cadet life. Necessarily this is accomplished at the expense, during a cadet's time at West Point, of freedom, leisure and, to some degree, of academic individuality and breadth of view. These he must develop after graduation and bring up to a level with the other invaluable qualities which received thorough attention at West Point. It is my belief that the scholarship is so especially profitable to a West Pointer because it does release and nourish during three years those sides of the scholar's mental make-up which are potential but by force of circumstances undeveloped when he graduates from the Military Academy. The combination of the two systems of training,

so diametrically opposed in purpose, method, and tradition, and each peerless in its own field, is an unique educational privilege and should, it seems, produce an unusual degree of mental equilibrium.

There are three features inherent in the Oxford system of education which a West Pointer will find new and particularly valuable when superimposed upon his Academy training. In the first place, his academic initiative and his resourcefulness as a student will find in the tutorial system just the sort of stimulation which they need. At West Point it is necessary that the cadet learn definite, set facts and he is told when and where to find them. He is indeed fortunate if, after having learned to absorb quickly the material placed before him, he is then privileged to study during three years under the tutorial system which employs to a considerable degree a research method. At Oxford he finds prescribed only the general subject matter of his course; he is left plenty of rein to elect for himself the manner of his study, the sources from which he will draw his material, the aspects of the general subject upon which he may wish to concentrate at the expense of other phases and, in fact, even the conclusions he finally draws as a result of his investigations. The Academy graduate reaches the climax of this new intellectual exercise when he writes his final "Schools" for these, instead of being, as at West Point, a long series of short examinations each covering a definite prescribed portion of text, are a collection of essays upon which the candidate must have been gathering and moulding ideas during the period of two years. Oxford opens up to the West Point Rhodes Scholar a new conception of study — this research, tutorial method — to which he can apply effectively two tools which he acquired at the Academy. These are the ability to absorb facts quickly and the habit of studying industriously. With these he must combine imagination if he is really to take advantage of the academic opportunities of Oxford.

The many interests and activities at Oxford which awaken and develop cultural taste constitute a second novelty very attractive and very beneficial to the Rhodes Scholar from West Point. If he does not already realize it before he gets to Oxford — but he probably does — he recognizes very early in his acquaintance with Oxford people that he has had little time to pay attention to art, music, architecture, or even reading. Now he finds the opportunity not just at the door but right in the room and as he tackles it and begins to drink in the delights it offers, more weight is added to the liberal side of the scales and the young officer gets nearer that equilibrium which is so valuable to him in the army or any other walk of life.

Thirdly, the West Pointer must learn at Oxford to organize his own time and utilize his leisure, which he will feel at first he has "nothing else but." At the Military Academy he followed an intensive closely regulated schedule without which he could never have completed all the work, academic and military, which was thereby crowded into four years for him. Now at Oxford he must effect an adjustment of study hours, sports, teas, clubs, movies and other activities which will, in his judgment, enable him to produce the best ultimate results considering not only his personal benefit but also his contacts as an American. Similarily, during the "vacs" he has the responsibility of striking the proper balance between study, travel and recreation. Responsibility he was taught at West Point, it is true, but it did not involve disposition of leisure time. The habit formed at Oxford of planning one's personal time in order to utilize it wisely will be invaluable in later years both to the individual and to all those who come under his control.

The three conspicuous features of Oxford undergraduate life and work which I have mentioned illustrate the contrast between Oxford and West Point. This opposition extends also to many other areas. I should like to repeat that I feel that the value of a Rhodes Scholarship to a West Point graduate is enhanced and intensified by the very fact that this contrast is so sharply defined, because the Oxford experience will develop in intellectually active young men certain interests and mental habits which may have lain dormant while other equally essential qualities were being unusually cultivated. If the mental scales are thus moved toward balance, is not this in the direction of true education?

Certain opportunities for special training which may be useful in the Army are afforded by Oxford honor schools and by the Rhodes Scholarship experience as a whole. A young officer who is interested in becoming an instructor at the United States Military Academy in such a subject as modern languages, law, mathematics, history, chemistry, English, or economics, would receive an unusually thorough preparation in the proper honor school. An officer who had spent three years in Europe as a Rhodes Scholar would also have a good background for assignment later in his career to any of our embassies in Europe as military attaché.

In addition to the advantages which are incident to Oxford University itself there are some others open to army Rhodes Scholars which provide experiences delightful at the time and perhaps very useful as part of an officer's professional education. During my three years at Oxford I was privileged to serve attachments to

engineer units of three foreign armies: the British, French, and Spanish. Needless to say, they were all fascinating experiences with something new, different, and interesting at every step. On the military side one saw the organization, training methods, and the manner of life of officers and troops. I did not, of course, make startling strategic discoveries, nor did I have time enough available, except in one instance, to get at all deeply into any particular subject. But the significant value of these periods spent with foreign army organizations arises, it seems to me, out of the contact thus established, usually for the first time, between West Point and the United States Army on the one hand and individual officers of foreign armies on the other. Because of our geographical isolation, European military people have little or no chance to frame an estimate of American system and policy; their opinion of our institutions and attitude is apt to be based upon prejudiced hearsay or unsupported imagination. How generally true it is that "the man I do not love is the man I do not know," and the truth of the old maxim stands out conspicuously today in the attitude of European nations toward the rather mysterious power across the Atlantic. Any circumstance that promotes and increases mutual acquaintance between representative classes of their people and ours is performing a vital service toward the development of that accord and understanding among nations which we now recognize as indispensable to peace and progress. Association on an easy, not too official basis between representative subalterns of our army and officers of all grades in foreign armies may only be a drop in the bucket of international intercourse, but I feel strongly that each such instance is a little bit that does definitely help and that the effect of individual cases will be greatly multiplied if a succession of officers can distribute this missionary work over a period of years.

Needless to say, the Rhodes Scholar from West Point does not confine his new acquaintances to military circles; he has perhaps more than ordinary avenues to meeting interesting people due to his connection with the American Embassy through the military attaché in the various countries which he visits. Like his colleagues he has the rare privileges of travel during the "vacs" and practical language study in the countries themselves. Both occupations contribute valuably to his education as an army officer and he can pursue them to their full advantage without financial pressure, due to his army pay, which also enables him to participate actively, if he desires, in undergraduate social interests and organizations at Oxford.

The army as a whole participates in the accomplishment of Cecil Rhodes' marvelous vision when its representatives share the experience which his will has provided for scholars from the English-speaking nations. A Rhodes Scholarship is certain to broaden these men as it does all who are chosen to enjoy its opportunities. Breadth of view is of essential importance to all army officers, for during the course of their careers they are called upon to engage in a wide field of activities, to deal with both civilians and service associates, and to assume a variety of responsibilities ranging, as I recently heard a senior officer observe, from raising pigs to running a bank. Both at home and abroad any capable officer may find himself in a position involving dealings with people or problems of other nations. Nothing else could give him a better start toward understanding these people, with ideas and problems that often conflict with our own, than an experience covering three very impressionable and adaptable years of his life which provides the means of gaining an insight into the viewpoint of several other nations.

Certainly all that may be said concerning the benefits of a Rhodes Scholarship to West Point cadets, the Military Academy, and the army, applies equally to Annapolis. Indeed the officers of our Navy have more frequent and widespread contact with representatives of other countries than do their military colleagues, and therefore a familiarity with European countries would be peculiarly valuable to them. The hope has been expressed that midshipmen from the Naval Academy will have an opportunity to compete for Rhodes Scholarships in the near future and that Annapolis will be represented in American Rhodes contingents. A cadet and a midshipman on opposing sides in a "cupper" ought to preclude the danger of a match getting stale.

Before going to Oxford I looked forward to the scholarship as a three-year tenancy of all the castles in Spain and other European countries which had ever been built up to that time by an imagination which I considered at least average. Now, in retrospection of the accomplished dream, I see those castles as miserable tumble-down hovels compared to the magnificent super-dream palaces which appeared in inexhaustible succession from the day one first landed in England until the final hour of departure. The only possible regret is of opportunities missed through lack of time, laziness, or sluggishness of imagination.

Looking back over the past seven years I am impressed by the similarity between the ideals of West Point and those expressed

by Cecil Rhodes in his will and espoused by its executors, notably in that both strive for a balanced combination of character, intellectual achievement, and physical vigor. Standing out in bold relief among my thoughts of Oxford is the idea that the experience there is in so many ways complementary to the West Point training, especially in the general freedom allowed the student and in the breadth of mental and geographical horizon cultivated thereby. We envy Cadet Lincoln, the scholar-elect of New York, his coming custody of Aladdin's Lamp.

DEPARTMENT OF STATE

FOR THE PRESS

MAY 12, 1950
No. 491

FOR RELEASE AT 7:00 P.M., E.D.T., SUNDAY, MAY 14, 1950. NOT TO BE PREVIOUSLY PUBLISHED, QUOTED FROM OR USED IN ANY WAY.

The following letter has been sent to the more than 500 full members of the American Society of Newspaper Editors:

"May 12, 1950

"As a member of the American Society of Newspaper Editors, you undoubtedly heard or read Senator Joseph McCarthy's speech before the ASNE convention in Washington on April 20.

"While the Secretary dealt with the same general subject in his subsequent speech, he of course did not undertake to deal with the specific allegations made by Senator McCarthy.

"I am therefore attaching an analysis, point by point, of some of the inaccuracies contained in the Senator's speech.

"Sincerely yours,

"EDWARD W. BARRETT
"Assistant Secretary for Public Affairs"

- - - -

ANALYSIS

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

ANALYSIS OF SENATOR McCARTHY'S SPEECH TO ASNE

1. Senator McCarthy said to the ASNE: "First, as to the figure 205." He then went on to assert that he had made it clear that he never claimed to have the names of 205 known Communists allegedly working in the State Department.

The Facts: In a radio address at Wheeling, West Virginia, on February 9, 1950, Senator McCarthy stated: "And, ladies and gentlemen, while I cannot take the time to name all the men in the State Department who have been named as active members of the Communist Party and members of a spy ring, I have here in my hand a list of 205. . . a list of names that were made known to the Secretary of State as being members of the Communist Party and who nevertheless are still working and shaping policy in the State Department." He was quoted to this effect by the Associated Press, and subsequently two officials of the radio station over which he spoke signed affidavits saying that they followed Senator McCarthy's speech and that this was what he said.

2. Senator McCarthy said to the ASNE: Two hundred and five persons "were named as bad security risks" and were "listed by the President's own security board and the forerunner of the present Loyalty Board as dangerous to our Government". He also stated that this "President's own security board" was "gotten rid of by Acheson in favor of a weaker board."

The Facts: In 1945, approximately 3,000 employees were transferred to the Department of State from other agencies. An ad hoc committee responsible to Assistant Secretary of State Russell, under Secretary of State Byrnes, was set up to carry out preliminary screening of these 3,000 people. On July 15, 1946, this committee filed a report listing 285 tentative disapprovals in categories ranging all the way from automatic disapproval of aliens to disapprovals on the basis of derogatory information.

The report specifically stated, however, that:

> "Any disapproval of the 285 may be reversed and subsequently approved if the further investigation resolves the investigation in favor of the employee. This is reported in order that the total disapproval basis may be thoroughly understood and does not mean on the surface that there are or were 285 people in the Department against whom charges would eventually be preferred."

Today all of these transferees into the State Department originally screened for further consideration or action are either no longer in the State Department or have been thoroughly investigated and cleared for employment. Those still on the roll number 46. Those 46 have, of course, been checked under the President's Loyalty Program by the FBI.

This departmental screening group, which Senator McCarthy referred to as the "President's own security board", war not abolished by Secretary Acheson. It automatically went out of existence in the Fall of 1946 upon the completion of its screening job, at which time Mr. Byrnes was Secretary of State. The present Loyalty Board was established by Secretary Marshall in the Summer of 1947.

3. Senator McCarthy said to the ASNE: "What is wrong with the misnamed Loyalty Board? Perhaps the case of George Wheeler, whom you will recall as having recently sought asylum from democracy behind the Iron Curtain, may explain why Communists, bad security and bad policy risks are retained on the government pay roll. Wheeler was first unanimously rejected by the Loyalty Board . . . Later . . . the Loyalty Board reversed itself and passed him and sent him a letter of apology."

The Facts: At no time has the case of George Wheeler ever been considered by a security or loyalty board of the Department of State. Mr. Wheeler was one of a group of former FEA employees in Germany who in September, 1945, were transferred temporarily to the rolls of the State Department. In February, 1946, that whole group was transferred to the War Department, and in fact Mr. Wheeler's transfer to the War Department was even earlier - in December, 1945. During his brief time on the State Department pay roll, Mr. Wheeler's case was under the jurisdiction of the Civil Service Commission. All these facts were set out in a departmental press release a week before Senator McCarthy made his misstatements.

4. Senator McCarthy said to the ASNE: "There are 600 clerks in the United States who have access to those [loyalty] files daily . . . yet five Senators cannot crack a file cover."

The Facts: Access to loyalty files is normally limited strictly to FBI and other government officials and their responsible subordinates when, and only when, particular files are needed in the proper execution of their duties.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

5. Senator McCarthy said to the ASNE: "First, let's look at that perennial joiner, Dr. Philip Jessup, our Ambassador-at-large . . . Why does he always join Communist fronts? Why not anti-Communist organizations?"

The Facts: Dr. Jessup testified, before the Subcommittee, that he had joined no Communist-front organizations, whereas the organizations to which he did belong included the following:

The American Legion (He is a former commander of Utica Post #229.)
The American Philosophical Society
The Foreign Policy Association
The American Bar Association

6. Senator McCarthy said to the ASNE: ". . . Dr. Jessup had control of the magazine Far Eastern Survey, when the Communist Campaign in 1943 was initiated therein to smear Chiang Kai-shek and deify all the Communists. . . . I pointed out that he was head of the Research Advisory Board having complete control of the magazine during the height of the Communist Party line campaign . . . Mr. Jessup's aide de camp was a Mr. T. A. Bisson, another expert on Far Eastern Affairs. He has spent considerable time in the State Department."

The Facts: Dr. Jessup was not Chairman of the Research Advisory Committee of the American Council of the Institute of Pacific Relations in 1943. He was merely one of 50 trustees of the American Council. Mr. T. A. Bisson never was an employee of the Department of State.

7. Senator McCarthy said to the ASNE: ". . . I am going to leave here on the table a number of photostats of checks representing Communist money -- thousands of dollars -- which was paid to his organization . . . The Communists knew what those thousands of dollars were being paid for." As documentation, Senator McCarthy provided photostats of two checks signed by Frederick Vanderbilt Field totalling $3,500.

The Facts: At that time, Dr. Robert Gordon Sproul, President of the University of California, was Chairman of the American Council of the Institute of Pacific Relations; Mr. Francis Harmon, Vice President of the Motion Picture Export Association, was Treasurer; and Mr. William R. Herod, now President of the International General Electric Company, was Chairman of the Finance Committee.

Mr. Juan Trippe, President of Pan American Airways, and Mr. Henry Luce, of Time and Life, were sponsors of a drive during that period for funds on behalf of the American Council of the Institute of Pacific Relations. Mr. Field's contributions, according to Senator McCarthy's own figures, totalled only $3,500, as compared with a total expense for the two-year period of approximately $200,000. About half of the amount was met by contributions from the Rockefeller Foundation and Carnegie Corporation. Generous donations by large industrial concerns made up a large portion of the remainder.

As Ambassador Jessup stated on April 3, 1950, "Surely these gentlemen would never have accepted payment from Mr. Field or anyone else for selling the Communist Party line."

8. Senator McCarthy said to the ASNE: "Now, let's briefly discuss the architect of our Far Eastern policy, this man Owen Lattimore."

The Facts: Senator Tydings asked Secretaries Hull, Byrnes, Marshall and Acheson whether this description was true or false. They all replied that it was false.

9. Senator McCarthy said to the ASNE: "The Afghanistan Government asked the United States in December of 1949 to send a preliminary mission to Afghanistan to investigate the possibility of economic development under United Nations technical assistance program. Owen Lattimore was selected to head this mission."

The Facts: Neither the United States nor the Department of State had anything to do with the sending of this mission to Afghanistan. It was sent by the United Nations at the request of the Afghanistan Government.

Senator McCarthy's statement is a repetition of a similar statement previously made on the floor of the Senate, citing the Library of Congress as the source of his information. On April 11, Senator Green of Rhode Island read on the floor of the Senate a letter dated April 10 from Dr. Luther Evans, Librarian of Congress, regarding Senator McCarthy's original quotation of this alleged information from the Library of Congress. Dr. Evans' reply said:

"I beg to report that the Library of Congress knows of no information to the effect that the Afghanistan Government ever made a request to the State Department

THIS PAGE IS UNCALSSIFIED

in relation to the Owen Lattimore mission; to the effect that the United Nations consulted the State Department on Dr. Lattimore's appointment to the mission; to the effect that the State Department recommended Dr. Lattimore for this assignment, or to the effect that Dr. Lattimore's expense on this trip and any salary or fee which may be involved are a charge on the United States, except in the sense that the United States is one of the contributors to the United Nations treasury.

"It is our understanding that the Afghanistan Government made a request to the United Nations in December 1949, for a technical assistance mission, that the United Nations responded by sending a preliminary survey mission to investigate the possibilities of a program of technical assistance and general economic development, and that the United Nations Secretariat chose Dr. Lattimore as one of the members of this preliminary survey mission."

Dr. Evans' statements are completely in line with the facts as known to the Department.

10. Senator McCarthy said to the ASNE: ". . .about three weeks ago I made a statement to the effect that Owen Lattimore had been requested by Acheson to, and did, furnish to the State Department a document to act as a guide for Ambassador-at-Large Jessup insofar as Asiatic policy was concerned." He also referred to this document as "Lattimore's Instructions to Jessup", and gave the impression that the Secretary and the Department attempted to conceal the document by calling it confidential.

The Facts: The Department publicly and fully explained in press conferences on March 31 that Owen Lattimore was one of a group of 31 persons who submitted written memoranda in response to requests made in August, 1949, by Ambassador Jessup. These memoranda were used as background material by a consultants' committee consisting of Mr. Raymond B. Fosdick, Mr. Everett Case, and Ambassador Jessup in their study of United States foreign policy in the Far East. Mr. Lattimore as director of the Walter Hines Page School of International Relations at Johns Hopkins, was also one of 25 private individuals participating in a round-table discussion on October 6, 7 and 8, 1949 arranged by the Office of Public Affairs for the purpose of exchanging views with informed private citizens on United States foreign policy toward China. The 31 who submitted memoranda were:

Former Consul General Joseph W. Ballantine, now at Brookings Institution
Professor Hugh Borton, Columbia University
Former President Isaiah Bowman, Johns Hopkins University
Dr. A. J. Brumbaugh, American Council on Education, Washington
Former Ambassador William Bullitt
Former Under Secretary Castle
Former Consul John A. Embry
Professor Rupert Emberson, Harvard University
Dr. Charles B. Fahs, New York City
Professor John K. Fairbank, Harvard University
Dr. Huntington Gilchrist, New York City
Professor Carrington Goodrich, Columbia University
Former Under Secretary Grew
Colonel Robert A. Griffin, former Deputy Administrator, ECA China
Former Ambassador Stanley K. Hornbeck
Roger Lapham, Former Administrator, ECA, China
Professor Kenneth S. Latourette, Yale University
Professor Owen Lattimore, Director of the Walter Hines Page School of International Relations, Johns Hopkins University
Oliver C. Lockhart, Export-Import Bank of Washington
Walter H. Mallory, Council on Foreign Relations
Professor Wallace Moore, Occidental College, Los Angeles
Professor Edwin O. Reischauer, Harvard University
C. A. Richards, Economic Cooperation Administration
Former Minister Walter S. Robertson, Richmond, Virginia
Dr. Lawrence K. Rosinger, New York, New York
Mr. James Rowe, Washington
Mrs. Virginia Thompson (Adloff), New York City
Professor Amry Vandenbosch, University of Kentucky
Professor Karl A. Wittfogel, Columbia University
Professor Mary Wright, Stanford University
Admiral Yarnell

The following, including Mr. Lattimore and some others of the 31, attended the Round Table at the Department October 6, 7 and 8 to discuss Far East Policy:

Joseph W. Ballantine, The Brookings Institution, Washington, D. C.
Bernard Brodie, Department of International Relations Yale University, New Haven, Connecticut

Harold M. Vinacke, Department of Political Science, University of Cincinnati,
Cincinnati, Ohio.

All of the memoranda and all of the views above refered to were of course submitted to confidence by their authors, and the Department could not expect these people to be frank unless it respected that confidence. The Department would not and did not, however, in any way interfere with publication of any memorandum by its author. In fact, the substance of Mr. Lattimore's article was published in an article which he wrote for the January 1950 issue of The Atlantic magazine.

11. Senator McCarthy said to the ASNE: "Here is the Comintern program for Asia: (1) The armies of Chiang Kai-shek must be destroyed; (2) The United States must be forced to withdraw from Korea; (3) Force the withdrawal of the United States forces from Japan; (4) Prevent the formation of a Pacific pact against communist aggression . . .

"That is the official Communist Party program. There is nothing secret about it.

"Here is Jessup's program, in this document, There is nothing secret about that, either, since we forced the State Department to make that public. What does Mr. Lattimore advocate as a foreign policy for Asia?

"(1) Abandon Chiang Kai-shek.

"(2) Get out of Korea.

"(3) Get out of Japan.

"(4) Deny the need of a Pacific pact.

"Is this striking parallel the result of master planning or is it pure accident? I leave it to you gentlemen to decide."

Senator McCarthy thus stated that Owen Lattimore's memorandum as summarized by Senator McCarthy to parallel the Comintern program "is Jessup's program."

The Facts: There is no "Jessup program" distinct from United States foreign policy. The United States' record and policy in the Far East, as it relates to the points made by Senator McCarthy, is well known. In the light of the Senator's charges, however, it may be summarized:

THIS PAGE IS UNCALSSIFIED

(1) The United States poure[illegible] tremendous amounts of aid into China [illegible] efforts to bolster the government of Chiang Kai-shek.

(2) The United States has led the fight for a free, democratic Korea; took its case to the United Nations; and, since the establishment of this government, has contributed substantial economic and military support.

(3) The United States as the principal occupying power in Japan will not enter into any peace treaty which makes impossible adequate protection of United States' security interests in the Western Pacific.

(4) The United States has publicly indicated that it would look with sympathy upon a regional alliance of Pacific nations, provided the impetus for such an association came from the nations themselves.

12. Senator McCarthy said to the ASNE: "This letter from Lattimore to Joseph Barnes, dated June 13, 1943, . . . was ar order to Barnes to get rid of all Chinese employees with OWI who were loyal to Chiang Kai-shek, and supplant them with Chinese loyal to the communists."

The Facts: Mr. Lattimore, of course, is not connected with the Department of State, but all OWI Correspondence is now in the custody of the Department. At the time Senator McCarthy publicly read from it, the document in question was classified "Secret". It has subsequently been declassified and the letter in its entirety was read into the record before the Senate Subcommittee on April 6. Moreover, the Department sent Senator McCarthy a copy of the letter on April 10.

The letter does not say what Senator McCarthy asserted it did. What it does say is: "In the circumstances, we have to be extremely careful about our Chinese personnel. While we need to avoid recruiting any Chinese communists, we must be careful not to be frightened out of hiring people who have loosely been accused of being Communists . . . For our purposes, it is wise to recruit as many unaffiliated Chinese as we can, to pick people whose loyalty will be reasonably assured on the one hand by the salaries which we pay them and on the other hand by the fact that they do not receive salaries or subsidies from somewhere else." (A copy of the letter is attached).

OFFICE OF WAR INFORMATION
111 Sutter Street
San Francisco, California

June 15, 1943

Mr. Joseph Barnes
Office of War Information
224 West 57th Street
New York, New York

Dear Joe:

In your capacity as a member of our Personnel Security Committee there are certain things which you ought to know about Chinese personnel. It is a delicate matter for me to tell you about these things because of my recent official connection with Generalissimo Chiang Kai-Shek. For that reason I am marking this Communication secret.

When we recently reduced the number of our Chinese staff in New York it was quite obvious that there was going to be trouble and that this trouble would take the form of accusations against the remaining personnel. The fact is that certain of the personnel with whose services we dispensed had connections outside the office. This leads directly into the main question. It is extremely important from the point of view of security that intelligence information should not leak out of our office through our Chinese personnel. It is an open secret in Washington that the security of various Chinese agencies there is deplorable. Any pipeline from our office to any of those agencies is not a pipeline but practically an open conduit.

However, it is not only a question of Chinese government agencies. There is also a well organized and well financed organization among the Chinese in this country connected with Wang Ching-wei, the Japanese puppet. This can be traced back to the history of the Chinese Revolution as a whole. To present it in the fewest possible words: Sun Yat-sen was largely financed for many years by Chinese living abroad. Not only Sun Yay-sen but Wang Ching-wei had close connections among the overseas Chinese. However much he is a traitor now the fact must be recognized that Wang Ching-wei is a veteran of Chinese politics with connections which he has nourished for many years among Chinese communications abroad including those in the United States.

Chinese in the United States come almost exclusively from a few localities on the coast of China, practically every one of which is now occupied by the Japanese. Thus these Chinese in America have both family connections and financial investments which are under the control of the Japanese, because of his years of political organizing work Wang Ching-wei knows all of these connections and can apply pressure through them.

On the other side there is a special organization within the Kuomintang or Chinese Nationalist Party at Chungking which is charged with maintaining political and financial connections with Chinese overseas. This Overseas Bureau also has a detailed knowledge of the Chinese communities in America and is able to apply pressure. Thus there is a very intense conflict going on every day in every Chinatown in America between the Wang Ching-wei agents and those of the Kuomintang. It must be remembered that while the Kuomintang is able to operate in a private way as a political party among Chinese residents in America, it is also the party which "owns" the Chinese Government and it thus able to make use of Chinese Government agencies.

Thirdly, there are numerous Chinese in America who are politically unaffiliated. There are of course Communists but they have neither the money nor the organization of the Wang Ching-wei and Kuomingtang groups. The genuinely unaffiliated Chinese are a curious compound product of Chinese politics and the American environment. They tend to be intensely loyal to China as a country, without conceiving that the Kuomintang or any other political organization has a monopoly right to control of their thoughts and actions. They are like Americans; they like to give their political allegiance, not to have it demanded of them. They are reluctant to support a regimented series of causes laid down for them under orders; like Americans, they often give moral and financial support to a scattered number of causes some of which may even conflict with each other to a certain extent.

THIS PAGE IS UNCALSSIFIED

The conflict between the Wang Ching-wei organizing group and the Kuomintang organizing group in America can not be fought out in the open. Both sides have very good reasons for not courting publicity. Each is anxious to bring into its fold as many of the unaffiliated Chinese as possible. Each is anxious not to be exposed as an "un-American" organization or a foreign political group working on American soil. Both of them accordingly find it very good tactics, not only to cover up themselves but to put pressure on those whom they are trying to bring under their control, to accuse unaffiliated Chinese of being Communists. This is an accusation which covers up the accuser at the same time that it puts pressure on the accused.

One of the outstanding rallying points of the unaffiliated Chinese in America is the New China Daily News in New York. This is controlled by an organization of laundrymen. I understand that the share-holders number two or three thousand and that they take an active interest in the newspaper. The essential thing about these laundrymen is that in that in the nature of their business they are independent small business men. This means that they are on the one hand fairly well insured against Communist idealogy, since the small business man of whatever nationality is likely to be a man who has made his way by his own initiative and enterprise and is therefore suspicious of collectivist economic theories. On the other hand these Chinese small business proprietors are reluctant to submit themselves unquestionably to the control of the vested interests which have grown up in China in association with the dominant Kuomimtang. The New China Daily News would probably not come under much pressure if it were not for the fact that it is one of the best edited Chinese papers in America with a growing circulation. It does not need to be subsidized or supported by a patron like many, perhaps the majority, of Chinese papers. It pays dividends on its own merits. A number of Chinese language papers in America receive subsidies from the Kuomintang. At least two, and perhaps three, receive subsidies from the Wang Ching-wei group. One or two others trace back to the group within the Kuomintang, which was at one time headed by the late Hu Han-min, a leader of a right-wing faction within the Kuomintang. The Hu Han-min group, through once regarded as right-wing conservatives, are now regarded in China as "old fashioned liberals" - - liberal, so to speak, short of the New Deal. They are less bitterly involved in Chinatown politics than the Wang Ching-wei and Kuomintang groups. The two latter, which are engaged in handing out carefully colored news and doctored editorial policies, are intensely jealous of and hostile to an unaffiliated paper like the New China Daily News which, so to speak, flaunts its sins by being so readable that the Chinese public in America buys it for its own sake.

It would be rash to say that there are no Communists connected with the New China Daily News. Here it is necessary to consider another peculiarity of the politics of Chinese living out of China. These Chinese are far from being tied to the chariot wheels of Moscow; but when it comes to resisting the trend toward totalitarian regimentation within China they are often willing to support parts of the program advocated by the Chinese Communists within China. This is so much a part of the pattern of politics of Chinese living out of China that it is not uncommon to find wealthy men, even millionaires, supporting the program of the Chinese Communists in whole or in part. This was, for instance, conspicuous in Malaya before the fall of Singapore. For such prosperous and independent Chinese it was a question either of backing their independent judgement of the steps that needed to be taken toward creating a working democracy within China, or of paying financial tribute to the Kuomintang, which sometimes tends to be autocratic, and not infrequently spurns advise from Chinese abroad at the same time that it demands their financial contributions.

In the specific setting of America, it is the independent small business man - - like the laundryman - - rather than the very few wealthy merchants, who most conspicuously maintain this tradition of political independence. In America, some of the most wealthy individuals are either committed to Wang Ching-wei and his puppet Japanese party or at least are hedging until they have a better idea of how the war is finally going to turn out.

In the circumstances we have to be extremely careful about our Chinese personnel. While we need to avoid recruiting any Chinese Communists we must be careful not to be frightened out of hiring people who have loosely been accused of being Communists. We have to be at least equally careful of not hiring people who are pipelines to the Wang Ching-wei group or

THIS PAGE IS UNCALSSIFIED

to one or other of the main factions within the Kuomintang. After all, as an American Government agency we should deal with the Chinese Government or regular agencies of the Chinese Government, but should not get in the position of committing ourselves to the Kuomintang, the political party which controls the Chinese Government, as if it were itself the Chinese Government. You will recognize both the importance of this proposition and the delicacy which it requires on the operational level.

For our purposes, it is wise to recruit as many unaffiliated Chinese as we can, to pick people whose loyalty will be reasonably assured on the one hand by the salaries which we pay them and on the other hand by the fact that they do not receive salaries or subsidies from somewhere else.

Mr. Chi and Mr. Chew Hong, both of our New York office, conform excellently to these requirements. Mr. Chi I have known for many years. Until his family estates were occupied by the Japanese, he was a wealthy landlord. He was brought up in the older scholastic tradition in China, before the spread of modern western education, but at the same time he is keenly interested in the national unification of China and the orderly development of a stable political organization there. I know by long experience that he is anything but a Communist; I also know that because of his seniority, his background of independent wealth, and his superior mentality he is not a man to be pushed around by party bureaucrats. Chew Hong is a much younger man, but one whom Dr. Chi trusts and of whoses integrity he is convinced. There is something in their relationship of the old Chinese standards of disciple and master. As long as Dr. Chi stands in the relationship of loyal friendship to me and the loyalty of an honest employee of an American Government agency, there will be no difficulty with either man, no irresponsible playing with Chinese politics, and no leakage to any Chinese faction.

The retention of both men is therefore a guarantee to the secrecy and security of the work of OWI as well as a guarantee of the confident fulfillment of directives. I urge you not to be high-pressured into getting rid of either man. I know that both men may be subjected to attacks. Given the time to work on it, I could undoubtedly trace such attacks to their orgin and give you the full details. I doubt whether the Personnel Security Committee of OWI would be able to trace such attacks, rooted in the intricacies of Chinese factional politics, to their source; but I should not like to see us placed in a position where, after getting rid of people now attached, we would be forced to hire people who would actually be nominees of factions not under our control.

It is for this reason that I have written this long letter to urge you to report to our Personnel Security Committee the necessity for exercising pronounced agnosticism when any of our Chinese personnel are attacked.

In the meantime I am doing my best to check over our Chinese personnel in San Francisco.

Once more I urge you to observe the strictest confidence in acting on this letter, because in certain quarters it might be considered that I am under moral obligation to see that OWI is staffed with Chinese who take their orders from some source other than the American Government.

Yours,

Owen Lattimore
Director, Pacific Operations

DEPARTMENT OF STATE

FOR THE PRESS

MAY 15, 1950
No. 501

1. Senator McCarthy said at Atlantic City: ". . . The skeleton files which the President has given to the Tydings Committee . . . were inadequate, . . . many of them had been completely rifled, . . . /and/ there is no way of knowing whether or not any file was complete." He also said that "in order to get at the truth, they must get not only the skeleton State Department loyalty files, but the Civil Service and the FBI files."

The Facts: A charge of tampering with records is a very serious charge. It has been described by the courts in this country as "highly improper". (State ex rel Department of Agriculture, Petitioner v. McCarthy, Circuit Judge, Respondent 238 Wisconsin 258, 270, 299 N.W. 58, 65 - 1941.) The files which have been made available to the Subcommittee by the President are complete. They contain the material collected by the Federal Bureau of Investigation and transmitted to the State Department through the Civil Service Commission. These files were reviewed by a representative of the Department of Justice before they were turned over to the subcommittee. A representative of the Department of Justice has also attended the meetings of the subcommittee at which the files were discussed. If Senator McCarthy believes any material has been deleted, it is his duty to bring to the attention of the subcommittee, and the FBI any evidence he has to back up his charge.

2. Senator McCarthy said at Atlantic City: Senator McCarthy described that portion of Owen Lattimore's memorandum on far eastern policy which dealt with South Korea and then said: "That is Lattimore's plan for South Korea. That is now the plan of the Lattimore-Acheson Axis for the entire Far East."

The Facts: Mr. Lattimore's relationship with the Department of State from 1933 to date and the circumstances under which he and 30 other people supplied memoranda containing their views on Far Eastern policy have been described many times. These facts of public record are not reflected in Senator McCarthy's statement.

The facts concerning Mr. Acheson's position on South Korea are also a matter of well known public record. On January 20, 1950 Mr. Acheson wrote a letter describing the adverse effects the defeat of the Korean Aid bill by a vote of 193 to 191 would have on our foreign policy. This letter which was the basis of a successful attempt to obtain aid for Korea is quoted below. It speaks for itself.

3. In his speech at Atlantic City, Senator McCarthy made other misstatements which will be refuted in the near future.

Following

THIS PAGE IS UNCALSSIFIED

Following is the text of Secretary of State Dean Acheson's letter of January 20, 1950, to the President:

"Dear Mr. President:

"The Department of State received with concern and dismay the report that the House of Representatives had rejected the Korea Aid Bill of 1949 by a vote of 193 to 191. This action, if not quickly repaired, will have the most far-reaching adverse effects upon our foreign policy, not only in Korea but in many other areas of the world. It has been fundamental to our policy that in those areas where a reasonable amount of American aid can make the difference between the maintenance of national independence and its collapse under totalitarian pressure, we should extend such aid within a prudent assessment of our capabilities. The American people understand this policy and have supported our extending aid in such circumstances; the success of such aid is a matter of public record.

"The Republic of Korea owes its existence in large measure to the United States, which freed the country from Japanese control. The peoples of the Republic of Korea, the other peoples of Asia, and the members of the United Nations under whose observation a government of the Republic was freely elected, alike look to our conduct in Korea as a measure of the seriousness of our concern with the freedom and welfare of peoples maintaining their independence in the face of great obstacles. We have not only given the Republic of Korea independence; since then we have provided the economic, military, technical, and other assistance necessary to its continued existence. Of the current program of economic assistance we are extending to Korea, half was provided by the Congress during the previous session. The withholding of the remainder would bring our efforts to an end in mid-course. It is our considered judgment that if our limited assistance is continued the Republic will have a good chance of survival as a free nation. Should such further aid be denied, that chance may well be lost and all our previous efforts perhaps prove to have been vain.

"We are concerned not only about the consequences of this abrupt about-face in Korea, whose government and people have made valiant efforts to win their independence and establish free institutions under the most difficult circumstances, but we are also deeply concerned by the effect which would be created in other parts of the world where our encouragement is a major element in the struggle for freedom.

"It is difficult for us to believe that the Members of the House of Representatives who voted against this measure took sufficiently into account the serious implications of this action upon the position of the United States in the Far East. These implications were set forth in considerable detail in hearings before the committees of Congress by the Department of State, Department of Defense and the Economic Cooperation Administration.

"In our judgment it would be disastrous for the foreign policy of the United States for us to consider this action by the House of Representatives as its last word on the matter."

DEPARTMENT OF STATE

FOR THE PRESS

MAY 20, 1950
No. 529

CAUTION
FUTURE RELEASE
NOTE DATE

FOR RELEASE AT 7:00 P.M., E.D.T., SATURDAY, MAY 20, 1950
NOT TO BE PREVIOUSLY PUBLISHED, QUOTED FROM OR
USED IN ANY WAY.

The Department of State today made public the following analysis of the speech delivered by Senator Joseph R. McCarthy in Chicago, May 6, 1950, on "Communism in Government":

1. Senator McCarthy said at Chicago: Senator McCarthy referred to the Department of State's files being examined by the Tydings Subcommittee as "skinny-ribbed bones of the files"; "skeleton files"; "These purged files"; "phony files"; "1947 and '48 files instead of 1949 and '50".

The Facts. The files transmitted to the Tydings Subcommittee are the full and complete State Department files current as of the date transmitted. They contain all information relevant to the determination of employee loyalty or security. Under the Federal Employees Loyalty Program, the Federal Bureau of Investigation is the agency charged with responsibility for conducting investigations into the loyalty of State Department personnel.

A representative of the Department of Justice has been present at the meetings of the Tydings Subcommittee. The files were viewed by a representative of the Department of Justice before they were turned over to the Subcommittee. The files made available to the Subcommittee contain the material collected by the Federal Bureau of Investigation and transmitted to the State Department.

2. Senator McCarthy said in Chicago: "Now from page 37 of the House Report I quote the following: '...almost anyone and everyone in the State Department had access to the files ...'"

The Facts. The report to which Senator McCarthy referred is a report of the House Appropriations Committee investigators, dated January 27, 1948, which accompanied the list of 108 cases which were the basis of Senator McCarthy's speech of February 20, 1950. Senator McCarthy misquoted this report.

The report said: "... most everyone and anyone in the Division has access to the files ..."

The Division that the House investigators were talking about was the Division of Security. That is the division charged with the physical and personnel security program of the Department and the Foreign Service, and it is therefore essential that its staff have access to the files when needed.

Senator

Senator McCarthy, by substituting "the State Department" for "the Division of Security", crudely misquotes the language of the report in order to give an entirely false impression: namely, that any and everyone in the Department has access to the files; whereas as a matter of fact such access is strictly limited to employees of the Division when required and to a very small number of employees outside the Security Division, such as the members of the Loyalty Security Board. Senator McCarthy substituted the entire State Department for the Division of Security, a crude misquotation for the purpose of giving an entirely false impression. It is not only a misquotation, it is a quotation out of context, a quotation over two years old made without reference to the facts as they exist at the present time.

3. Senator McCarthy said at Chicago: "Tell them to take the list of names which I have given ... the Secretary of State ... ."

The Facts. Despite Under Secretary of State Peurifoy's reiterated requests since February 11, 1950 that Senator McCarthy furnish the Department with a list of names of the "205" or "57" accused State Department employees, Senator McCarthy has never furnished the Department or the Secretary of State such a list of names.

4. Senator McCarthy said at Chicago: Describing the Federal Loyalty Program, Senator McCarthy said, "First of all, it permits each Department to investigate its own people. Those doing the investigating know little or nothing of communist techniques, even less of about how to conduct an investigation... ."

The Facts. The Federal Bureau of Investigation is the agency charged under Executive Order 9835, issued over three years ago, with responsibility for conducting loyalty investigations under the Federal Loyalty Program.

5. Senator McCarthy said at Chicago: Describing loyalty investigations, Senator McCarthy said, "In dozens of cases, in dozens of cases -- for instance, recommendation from Alger Hiss on State Department employees was all that was needed to completely clear them -- like accepting a recommendation from Dillinger in hiring a bank clerk."

The Facts. There is not a single instance of this.

6. Senator McCarthy said at Chicago: "You will recall a former State Department employee by the name of George Wheeler recently retired behind the Iron Curtain after making typical communist name calling statements damning and cursing the United States. This man, George Wheeler, who had been assigned tremendously important work by the State Department had first been given a completely clean bill of health by the Loyalty Board even though his file would have convinced anyone who could add two and two that he was a full fledged communist."

The Facts: At no time has the case of George Wheeler ever been considered by a security or loyalty board of the Department of State. Mr. Wheeler was one of a group of former FEA employees in Germany who in September 1945 were transferred temporarily to the rolls of the State Department. In February 1946 the whole group was transferred to the War Department,

and in

and in fact Mr. Wheeler's transfer to the War Department was even earlier -- in December 1945. During his brief time on the State Department pay roll, Mr. Wheeler's case was under the jurisdiction of the Civil Service Commission. All these facts were set out in a departmental press release a month before Senator McCarthy made his misstatements.

These facts were also contained in the Department's analysis of Senator McCarthy's April 20th speech to the American Society of Newspaper Editors, in which the Department pointed out twelve glaring McCarthy inaccuracies. Senator McCarthy on May 15 replied to the Department's statement by citing two alleged inaccuracies in the Department's analysis of his speech. He was silent as to the remaining ten. Of the two so-called inaccuracies he cited, one pertains to the case of George Wheeler. As to George Wheeler, Senator McCarthy said that the Department should "admit that Wheeler was on the pay roll and given an absolutely clean bill of health by whatever Government Loyalty Board cleared personnel for the State Department." Two comments may be made thereon: first, as of the date of Mr. Wheeler's brief employment with the Department the present loyalty program, under which the Department's loyalty board was established, was not in existence; second, Senator McCarthy's implication was that the Department's Loyalty Board was at fault. Even Senator McCarthy should see the irrelevancy of his attributing to the State Department matters under the jurisdiction of the Civil Service Commission.

7. Senator McCarthy said at Chicago: "Mr. Service, you will recall, was picked up by the FBI in connection with the Amerasia case... The papers carried the story that J. Edgar Hoover, who is not noted for over-statements, that J. Edgar Hoover stated that this is a 100 per cent air-tight case of espionage."

The Facts. On May 1, 1950, Deputy Under Secretary of State Peurifoy in a letter to Mr. Peyton Ford, The Assistant to the Attorney General, asked whether Mr. Hoover, in fact, made any similar statement. Mr. Ford, on May 8, 1950, replied: "You are advised that Mr. Hoover did not make the statement which has been attributed to him."

The exchange of correspondence is attached. (See pp. 8, 9)

8. Senator McCarthy said at Chicago: "...the State Department which is about to hear the case of Service is now busily giving Mr. Service's lawyer the secret documents which the President has denied the Senate, this so that he can properly defend Mr. Service."

The Facts. The Department has categorically denied this. Mr. Service has been furnished copies of documents which he himself had prepared for the Department in the course of his duties as a foreign service officer.

Relevant excerpts from a letter of May 4, 1950 by General Conrad E. Snow, Chairman of the Department's Loyalty Security Board, to Mr. Whitelaw Reid, editor of the New York Herald Tribune, are attached. (See page 9)

THIS PAGE IS DECLASSIFIED IAW EO 13526

9. Senator McCarthy said at Chicago: "First take the case of Philip Jessup, the State Department's Ambassador at Large. Now, here was really a great joiner, especially Communist front organizations...organizations which the President's own Attorney General and Congressional committee have labeled as agents of the Communist Party."

The Facts. In view of Senator McCarthy's repeated assertions the Department wrote to Mr. Morgan, Counsel of the Subcommittee of the Senate Foreign Relations Committee, investigating Senator McCarthy's charges, to see if Senator McCarthy had supplied them with any information to back up these charges. Mr. Morgan replied that Senator McCarthy has not supplied any such material. The only documentary material supplied to the committee concerning the organizational affiliations or associations of Ambassador Jessup was provided by Senator Hickenlooper, a photostat of one letterhead of the American Law Students Association listing Professor Philip Jessup of Columbia University on the Association' "Faculty Advisory Board." The American Law Students Association is not listed by the Attorney General and does not appear on the list of "Citations by Official Government Agencies" issued in 1948 by the House Committee on UnAmerican Activities.

The correspondence with Mr. Morgan is attached. (See pp. 10 and 11.)

Dr. Jessup testified, before the Subcommittee, that he had joined no Communist-front organizations, whereas the organizations to which he did belong included the following:

The American Legion (He is a former commander of Utica Post #229)
The American Philosophical Society
The Foreign Policy Association
The American Bar Association

On April 6, 1950 the Utica Post #229 passed a resolution condemning Senator McCarthy's attack upon their past commander, Philip C. Jessup. A copy of this resolution is attached. It will be noted that a copy of it was sent to Senator McCarthy with the admonition that "his reckless and despicable conduct in this instance cannot be condoned by any right-thinking American and should never be repeated if he hopes to retain a shred of public respect." (For copy of resolution, see pp. 11 and 12)

10. Senator McCarthy said at Chicago: "Jessup ... was largely in charge of a publication known as the Far Eastern Survey, the publication of the American Council of the Institute of Pacific Relations; that he was in charge while it was spewing forth the perfumed Communist Party line sewage... ."

The Facts. Senator McCarthy grossly exaggerated Dr. Jessup's relationship with "Far Eastern Survey" based on the single fact that in 1944 Dr. Jessup served on the Research Advisory Committee of the American Council of the Institute of Pacific Relations.

Senator McCarthy's allegation that "Far Eastern Survey" followed the Communist Party originates in discredited contentions made by one Alfred Kohlberg in 1944. The American Council of the Institute of Pacific Relations investigated Kohlberg's charges. In a document circulated to its members, it was demonstrated that Kohlberg had ignored the overwhelming number of facts that did not support his contention. The document showed, among other things,

things, that Kohlberg had quoted, in connection with "Far Eastern Survey, and other publications, from less than 2 per cent of the articles published and from less than .002 per cent of the books published. In April 1947, the membership of the American Council of the Institute of Pacific Relations in a vote of 1163 to 66 overwhelmingly repudiated Kohlberg's charges as "inaccurate and irresponsible."

11. Senator McCarthy said at Chicago: "I have brought with me photostatic copies of checks representing thousands of dollars of Communist money paid to Jessup's organization." As documentation he provided photostats of two checks signed by Frederick Vanderbilt Field totalling $3,500.

The Facts. This is another repetition of a refuted charge made by Senator McCarthy many times before. Senator McCarthy repeats it although it has already been refuted. The inference is that the Institute of Pacific Relations had been "bought" with Communist money. At that time, Dr. Robert Gordon Sproul, President of the University of California, was Chairman of the American Council of the Institute of Pacific Relations; Mr. Francis Harmon, Vice President of the Motion Picture Export Association, was Treasurer; and Mr. William R. Herod, now President of the International General Electric Company, was Chairman of the Finance Committee.

Mr. Juan Trippe, President of Pan American Airways, and Mr. Henry Luce, of Time and Life, were sponsors of a drive during that period for funds on behalf of the American Council of the Institute of Pacific Relations. Mr. Field's contributions, according to Senator McCarthy's own figures, totalled only $3,500, as compared with a total expense for the two-year period of approximately $200,000. About half of the amount was met by contributions from the Rockefeller Foundation and Carnegie Corporation. Generous donations by large industrial concerns made up a large portion of the remainder.

12. Senator McCarthy said at Chicago: "Mr. Lattimore, as the nation knows, has long been referred to as the architect of the State Department's Far Eastern policy, the architect whose shadow lingers over the corpse of China."

The Facts. Senator Tydings asked Secretaries Hull, Byrnes, Marshall and Acheson whether this description was true or false. They all replied that it was false. These letters were made public by Senator Tydings on April 29, 1950. The person responsible for long and repeated use of the term "architect of the Far Eastern Policy" is Senator McCarthy who employed the term in his testimony before the Subcommittee.

13. Senator McCarthy said at Chicago: "....so that you will have a full picture of the extent to which Lattimore shaped our dismal policy of failure in the Far East, I call to your attention a secret document which he furnished to the State Department in August of 1949, a document which the State Department itself labeled as a guide for Ambassador at Large Jessup... ."

The Facts. This is another repetition of a refuted McCarthy charge.

The

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

The Department publicly and fully explained in press conferences on March 31, that Owen Lattimore was one of a group of 31 persons who submitted written memoranda in response to requests made in August, 1949, by Ambassador Jessup. These memoranda were used as background material by a consultants' committee consisting of Mr. Raymond B. Fosdick, Mr. Everett Case, and Ambassador Jessup in their study of United States foreign policy in the Far East.(Mr. Lattimore's memorandum was never singled out, or labeled as a guide for Ambassador Jessup.) Mr. Lattimore as director of the Walter Hines Page School of International Relations at Johns Hopkins, was also one of 25 private individuals participating in a round-table discussion on October 6, 7, and 8, 1949 arranged by the Office of Public Affairs for the purpose of exchanging views with informed private citizens on United States foreign policy toward China. The 31 who submitted memoranda were:

Former Consul General Joseph W. Ballantine,
  now at Brookings Institution
Professor Hugh Borton, Columbia University
Former President Isaiah Bowman, Johns Hopkins University
Dr. A. J. Brumbaugh, American Council on Education,
  Washington.
Former Ambassador William Bullitt
Former Under Secretary Castle
Former Consul John A. Embry
Professor Rupert Emberson, Harvard University
Dr. Charles B. Fahs, New York City
Professor John K, Fairbank, Harvard University
Dr. Huntington Gilchrist, New York City
Professor Carrington Goodrich, Columbia University
Former Under Secretary Grew
Colonel Robert A. Griffin,
  former Deputy Administrator, ECA China
Former Ambassador Stanley K. Hornbeck
Roger Lapham, Former Administrator, ECA China
Professor Kenneth S. Latourette, Yale University
Professor Owen Lattimore, Director of the Walter Hines
  Page School of International Relations, John Hopkins
  University
Oliver C. Lockhart, Export-Import Bank of Washington
Walter H. Mallory, Council on Foreign Relations
Professor Wallace Moore, Occidental College, Los Angeles
Professor Edwin O. Reischauer, Harvard University
C. A. Richards, Economic Cooperation Administration
Former Minister Walter S. Robertson, Richmond, Virginia
Dr. Lawrence K. Rosinger, New York, New York
Mr. James Rowe, Washington
Mrs. Virginia Thompson (Adloff), New York City
Professor Amry Vandenbosch, University of Kentucky
Professor Karl A. Wittfogel, Columbia University
Professor Mary Wright, Stanford University
Admiral Yarnell

The following, including Mr. Lattimore and some others of the 31, attended the Round Table at the Department October 6, 7, and 8 to discuss Far East Policy:

Joseph W. Ballantine, The Brookings Institution,
  Washington, D. C.
Bernard Brodie, Department of International Relations,
  Yale University, New Haven, Connecticut
Claude A. Buss, Director of Studies, Army War College,
  Washington, D. C.

Kenneth

Kenneth Colgrove, Department of Political Science, Northwestern University, Evanston, Illinois.
Arthur G. Coons, President, Occidental College, Los Angeles, California.
John W. Decker, International Missionary Council, New York, New York.
John A. Fairbank, Committee on International and Regional Studies, Harvard University, Cambridge, Massachusetts.
William R. Herod, President, International General Electric Company, New York, New York.
Arthur N. Holcombe, Department of Government, Harvard University, Cambridge, Massachusetts.
Benjamin H. Kizer, Graves, Kizer, and Graves, Spokane, Washington.
Owen Lattimore, Director, Walter Hines Page School of International Relations, Johns Hopkins University, Baltimore, Maryland.
Ernest B. MacNaughton, Chairman of the Board, First National Bank, Portland, Oregon.
George C. Marshall, President, American Red Cross, Washington, D. C.
J. Morden Murphy, Assistant Vice President, Bankers Trust Company, New York, New York.
Nathaniel Peffer, Department of Public Law and Government, Columbia University, New York, New York.
Harold S. Quigley, Department of Political Science, University of Minnesota, Minneapolis, Minnesota.
Edwin O. Reischauer, Department of Far Eastern Languages, Harvard University, Cambridge, Massachusetts.
William S. Robertson, President, American and Foreign Power Company, New York, New York.
John D. Rockefeller, III, President, Rockefeller Brothers' Fund, New York, New York.
Lawrence K. Rosinger, American Institute of Pacific Relations, New York, New York.
Eugene Staley, Executive Director, World Affairs Council of Northern California, San Francisco, California.
Harold Stassen, President, University of Pennsylvania, Philadelphia, Pennsylvania.
Phillips Talbot, University of Chicago, Chicago, Illinois.
George E. Taylor, University of Washington, Seattle, Washington.
Harold M. Vinacke, Department of Political Science, University of Cincinnati, Cincinnati, Ohio.

All of the memoranda and all of the views above referred to were of course submitted in confidence by their authors, and the Department could not expect these people to be frank unless it respected that confidence. The Department would not and did not, however, in any way interfere with publication of any memorandum by its author. In fact, the substance of Mr. Lattimore's article was published in an article which he wrote for the January 1950 issue of The Atlantic magazine.

14. Senator McCarthy said at Chicago: "But let me give a brief resume of the official Communist Party program for Asia -- there is no secret about that. Number 1, destroy the armies of Chiang Kai-shek. Number 2, get the United States out of Korea. Number 3, force the withdrawal of United States forces from Japan; and number 4, prevent the formation of a Pacific Pact against Communist aggression.

"Now

"Now, what does Lattimore tell Jessup our policy in Asia should be? Listen to this if you will: Number 1, abandon Chiang Kai-shek; number 2, get out of Korea; number 3, withdraw United States forces from Japan; and 4, deny the need of a Pacific Pact."

The Facts. This is another repetition of a refuted McCarthy charge.

The United States' record and policy in the Far East, as it relates to the points made by Senator McCarthy may be summarized as follows:

(1) The United States poured tremendous amounts of aid into China in efforts to bolster the government of Chiang Kai-shek.

(2) The United States has led the fight for a free, democratic Korea; has taken its case to the United Nations; and, since the establishment of this government, has contributed substantial economic and military support.

(3) The United States as the principal occupying power in Japan will not enter into any peace treaty which makes impossible adequate protection of United States' security interests in the Western Pacific.

(4) The United States has publicly indicated that it would look with sympathy upon a regional alliance of Pacific nations, provided the impetus for such an association came from the nations themselves.

- - - -

Following is the material referred to on pages 3 and 4:

Exchange of correspondence between Mr. John E. Peurifoy, Deputy Under Secretary of State, and Mr. Peyton Ford, Assistant to the Attorney General, (referred to on page 3):

May 1, 1950

Dear Mr. Ford:

In his address on April 20, 1950 to the American Society of Newspaper Editors at the Hotel Statler in Washington, Senator McCarthy said:

"One of those arrested was John S. Service. He was never convicted; he was never tried, he was never indicted.

"J. Edgar Hoover, Director of the FBI, publicly stated at the time of the arrests that this case was a 100-per-cent air-tight case of espionage. At the time the case broke John S. Service was picked up by the FBI. Mr. Hoover made that statement, and he seldom errs on the side of overstatement, as you well know."

The Department of State is naturally interested in whether or not this statement of Senator McCarthy is an accurate one. As a result, I would appreciate it if you would inform the Department as soon as possible whether the Director of the Federal Bureau of Investigation made any statement similar to that attributed to him by Senator McCarthy.

Sincerely yours
JOHN E. PEURIFOY
Deputy Under Secretary

The Honorable
Peyton Ford,
The Assistant to the Attorney General.

- -

May 8,

May 8, 1950

John E. Peurifoy, Esquire
Deputy Under Secretary
Department of State
Washington, D. C.

Dear Mr. Peurifoy:

This is in reply to your letter dated May 1, 1950, inquiring as to the accuracy of a statement alleged to have been made by J. Edgar Hoover, Director, Federal Bureau of Investigation, at the time of the arrest of John S. Service and other suspects involved in the so-called "Amerasia" case. You are advised that Mr. Hoover did not make the statement which has been attributed to him.

Yours Sincerely,

PEYTON FORD
The Assistant to the Attorney General

EXCERPTS FROM GENERAL SNOW'S LETTER TO THE NEW YORK HERALD TRIBUNE
(Referred to on page 3)

Because of the reputation of the New York Herald Tribune for fair and objective reporting, I am taking the liberty of calling your attention to the headings of two articles which appeared in your issues of May 3 and 4, respectively, regarding the conduct of the John S. Service case by the Loyalty Security Board of the Department of State, of which I am Chairman . . . .

Nor is it true that Mr. Service is being given any illegitimate advantage in the matter of access to papers. Mr. Service has not been given and will not be given access to the loyalty or personnel files which were gathered by the FBI and other investigatory bodies and which were refused by the President to the Senate Committee. Mr. Service is entitled, however, as a matter of elementary fairness to see and put in evidence, any reports or other papers in the files of the State Department which were prepared by him or in connection with the missions on which he served, which may be material to his defense. Action by the Department of State is necessary to permit him to show them to counsel. To date, the only confidential documents on which this action has been taken are documents actually written by Mr. Service himself. This is all there is to that part of the story.

The Loyalty Security Board of the Department of State is a judicial body set up for the purpose of giving to an employee accused of disloyalty, or of being a security risk, a fair hearing. While under the regulations he has no opportunity to confront and cross-examine witnesses who have given confidential information to the Board, or even to see a transcript of their statements, he is advised of the substance of the accusations, and must be given a fair opportunity to defend himself, not only by his own testimony, but also by the production of any witnesses or of any documentary evidence that may tend to establish his innocence of the accusations. The Board has an obligation to give him the fullest opportunity to prepare and present his defense.

Exchange

Exchange of correspondence between Mr. John E. Peurifoy, Deputy Under Secretary of State, and Mr. Edward P. Morgan, Chief Counsel, Foreign Relations Subcommittee Investigating the State Department:
(Referred to on page 4)

May 16, 1950

Dear Mr. Morgan:

In connection with the analysis of Senator McCarthy's speech to the American Society of Newspaper Editors forwarded on May 12, 1950 to the Society by Assistant Secretary Barrett, Senator McCarthy has stated, as quoted on May 15 by the Associated Press:

"The State Department also states that Jessup belonged to no Communist front organizations. I gave photostatic proof to the committee that he was affiliated with five organizations listed by the Attorney General or congressional committees as fronts for the Communist Party.

"He was a director of one of the worst of such organizations named by the Attorney General, namely the China Aid Council of the American League for Peace and Democracy."

At Atlantic City on the same day he said:

"... Now, the thing they forget is that I have presented to the Committee photostats showing that he belonged, that he was affiliated with not one, but with five Communist front organizations; and that he not only belonged to, but was a Director of one of the worst of the lot, named as such by the Attorney General..."

In view of these assertions of Senator McCarthy, it would be very much appreciated if you could make available to this Department copies of the photostats which the Committee has received from him.

Sincerely yours,

JOHN E. PEURIFOY

Mr. Edward P. Morgan,
Chief Counsel,
Foreign Relations Subcommittee,
The Capitol.

- -

May 17, 1950

Mr. John E. Peurifoy
Deputy Undersecretary
U.S. State Department
Washington, D. C.

Dear Mr. Peurifoy:

Reference is made to your letter of May 16, 1950, referring in turn to the remarks, as quoted by the Associated Press, of Senator Joseph R. McCarthy relative to Dr. Philip Jessup, as follows:

"The State Department also states that Jessup belonged to no Communist front organizations. I gave photostatic proof to the committee that he was affiliated with five organizations listed by the Attorney General or congressional committees as fronts for the Communist Party.

"He was

THIS PAGE IS DECLASSIFIED IAW EO 13526

"He was a director of one of the worst of such organizations named by the Attorney General, namely the China Aid Council of the American League for Peace and Democracy."

* * *

". . .Now, the thing they forget is that I have presented to the Committee photostats showing that he belonged, that he was affiliated with not one, but with five Communist front organizations; and that he not only belonged to, but was a Director of one of the worst of the lot, named as such by the Attorney General. . .."

Relative to your request for photostatic copies of the material stated to have been turned over to the subcommittee by Senator McCarthy, you are advised that after a careful and diligent search of our files, we find no record of any material having been turned over to the subcommittee by Senator McCarthy indicating that Dr. Jessup has been associated with Communist front organizations.

For your information, however, in the course of Senator Hickenlooper's examination of Dr. Jessup, he offered in evidence, at page 530 of the transcript, a photostat of a letterhead of an organization known as the American Law Student's Association on which "Prof. Philip Jessup" of Columbia University is listed on the "Faculty Advisory Board", along with other named individuals. The Subcommittee has been supplied no other documentary material concerning organizational affiliations or associations of Dr. Jessup.

After hearing of Senator McCarthy's statements referred to above, I immediately called his office requesting the photostatic material to which he referred. Again on May 16, 1950, I called Senator McCarthy personally, advising that the subcommittee had not been supplied the photostatic material concerning Dr. Jessup to which he had referred and requested that he supply the same for our record. As yet, I have not been supplied the photostats in question.

Should they be received by me, I shall be glad to make copies thereof available to your office.

Sincerely yours,

EDWARD P. MORGAN
Chief Counsel
Subcommittee Investigating
the State Department.

RESOLUTION CONDEMNING ATTACK UPON PAST COMMANDER PHILIP C. JESSUP ADOPTED AT A REGULAR MEETING OF UTICA POST #229 AMERICAN LEGION, HELD ON APRIL 6TH, 1950 (Referred to on page 4)

WHEREAS, Utica Post #229 American Legion is proud to number among the list of its Past Commanders a distinguished comrade, friend, and charter member, Ambassador Philip C. Jessup, whose record of patriotic devotion and continued helpfulness to our Country over a period of many years is a source of great satisfaction, pride and distinction to Utica Post and to its entire membership; and

WHEREAS,

WHEREAS, the sterling character, splendid reputation, and unquestionable loyalty and patriotism of Past Commander Philip C. Jessup, both privately and in his public capacity as U.S. Ambassador-at-Large, have recently been subjected to scurrilous, unprincipled, and wholly unjustifiable attack by one Joseph McCarthy, who in so doing has sullied the office of U.S. Senator which he presently holds,

NOW THEREFORE, BE IT RESOLVED that Utica Post $229 American Legion and its entire membership shall and do strongly resent, condemn and decry the unprincipled, unjustified, unsportsmanlike, un-American and intolerable conduct of Senator Joseph McCarthy in his wanton attempt without proof or reason to smear and destroy the good reputation and high standing of so devoted and patriotic a citizen as our esteemed and valued friend and comrade, the Honorable Philip C. Jessup, U.S. Ambassador-at-Large; and be it further

RESOLVED, that Utica Post $229 American Legion and its members in meeting duly assembled feel privileged at this time to reaffirm their continued trust and confidence in, their esteem and devotion to, and their lasting friendship for a distinguished public servant, a loyal patriot, and a great citizen, the Hon. Philip C. Jessup, a Past Commander of this Post; and be it further

RESOLVED that this resolution be inscribed upon the Minutes of this meeting, that a copy thereof be delivered to our comrade, Ambassador Jessup; that a second copy be delivered to the public press; and that a third copy be mailed to Senator McCarthy with the admonition that his reckless and despicable conduct in this instance cannot be condoned by any right thinking American and should never be repeated if he hopes to retain a shred of public respect.

* * *

DEPARTMENT OF STATE

FOR THE PRESS

MAY 25, 1950
NO. 549

FOR RELEASE AT 7:00 P.M., E.D.T., THURSDAY, MAY 25, 1950.
NOT TO BE PREVIOUSLY PUBLISHED, QUOTED FROM OR USED IN ANY WAY.

The Department of State today made public the following analysis of some of the factual inaccuracies in the speech delivered by Senator Joseph R. McCarthy at Atlantic City, May 15, 1950, to the Sons of the American Revolution:

(1) Senator McCarthy said at Atlantic City: "/as to/ the skeleton files which the President has given to the Tydings Committee ... I have made photostats of a report /of House investigators/... based partly on FBI investigations of the files... they set forth in some detail that ... some of them have been completely rifled ... that practically every one in the Division had complete and free access..." (Emphasis supplied)

The Facts: This charge has already been demonstrated to be false. It was previously made by Senator McCarthy at Chicago on May 6, 1950, and the Department commented thereon in its press release of May 20. It was there pointed out that the files transmitted to the Subcommittee were complete files; that Senator McCarthy was referring to a report submitted by investigators of the House Appropriations Committee in 1948 and that the Senator had misquoted the language of the report by substituting "the State Department" for "the Division of Security". It is noted that the Senator at Atlantic City repaired his quotations by using "the Division" in place of "the Department of State."

At Atlantic City Senator McCarthy added one new element. He refers to an "FBI investigation of the files". The "FBI investigation" he refers to was a survey of the Security Division made for the Department by the FBI at the Department's request. In the language of the House Investigators, who conducted their investigation in the Fall of 1947:

"In April 1947, the Federal Bureau of Investigation, at the request of the State Department, made a survey of the Security and Investigations Division ..."

There was no suggestion, either expressed or implied in either the FBI or the House Report, that the condition of the files in 1947 was purposeful or suspicious. Senator McCarthy's use of the word "rifled" in speaking of the files was entirely without substantiation. The constructive criticism and suggestions invited from the FBI and the House Investigators have been of great help.

In 1950 these files are as rigidly controlled, accurate, and complete as it is possible to make them. The files delivered to the Subcommittee are complete files -- State Department reports,

FBI

THIS PAGE IS DECLASSIFIED IAW EO 13526

FBI reports, interrogations, hearings, administrative memoranda, even pencilled working papers -- everything. On May 10 when the committee started examining the files, Senator Tydings is quoted as saying:

"These 81 files contain not only all of the data which the State Department investigators have assembled, but also all of the loyalty data which the FBI has gathered and referred to the State Department and which has been made a part of these files.

"Thus the Committee will have the complete record from all sources... ."

(2) Senator McCarthy said at Atlantic City: "Now to those in the State Department who say that Soviet Russia's aims have changed in the last few years and that she no longer wants to enslave America... ."

The Facts: Senator McCarthy insinuates that there are those in the State Department who do not realize that Soviet aims and propaganda are directed against America's free institutions.

The United States is striving, by all possible means, to preserve these free institutions. The Department and its personnel have no illusions about the methods or the aims of the Soviet Union and the Communist Party here or abroad.

Ambassador Jessup -- whom Senator McCarthy has accused of having "an unusual affinity for communist causes" -- expressed the viewpoint of the entire Department when he told the press of India and the world at New Delhi, February 23, 1950:

"Since the end of the Second World War, history has recorded the extension of a new imperialism that has brought more than a dozen countries under the domination of a single expanding power. The device used by this expanding power in extending its imperialism is to hold out the glittering promises of communism as a beacon light for the rescue of peoples who are suffering from economic underdevelopment or who are trying to remove the shackles of the old traditional kinds of colonialism. However, where communism gains control, it becomes immediately apparent that the peoples are not allowed to determine their own future, but must conform to a single policy laid down in Moscow."

Similarly, Counselor George Kennan wrote in an article appearing in the March issue of The Reader's Digest:

"The Russian leaders believe our downfall is inevitable. They would do anything they can to hasten it. ..."

On March 16, 1950, Secretary Acheson said at Berkeley:

"We can see no moral compromise with the ... theses of international communism: that the end justifies the means, that any and all methods are therefore permissible, and that the dignity of the human individual is of no importance as against the interest of the state.

"To our minds, these principles mean, in their practical application, the arrogation to individual human leaders, with all their inevitable frailties and limitations, of powers and pretenses which most of us would be willing to concede only to the infinite wisdom

and

and compassion of a Divine Being. They mean the police state, with all that that implies; a regimentation of the worker which is hardly distinguishable from slave labor; a loss to society of those things which appear to us to make life worth living; a denial of the fundamental truths embodied in all the great religions of the world."

(3) Senator McCarthy said at Atlantic City: (Referring to Mr. Owen Lattimore:) "... the architect of our eastern policy, Owen Lattimore."

"... Mr. Acheson's architect."

"... this architect of the new Lattimore-Acheson Pacific plan ... ."

The Facts: This characterization of Mr. Lattimore also has been repeatedly disproved. On April 29, 1950, Senator Tydings released letters he received from Secretaries Hull, Byrnes, Marshall and Acheson conclusively showing that the description of Lattimore as an architect of our Far Eastern policy is false. Although it appeared widely in the press at the time, the text of this correspondence is attached, because of Senator McCarthy's twice renewed disregard of the facts.

(4) Senator McCarthy said at Atlantic City: "... after all, doesn't Mr. Lattimore... say in his secret instructions to the State Department... ."

The Facts: As has now been publicly set forth by the Department several times, Owen Lattimore was one of a group of 31 persons who submitted written memoranda in response to requests made in August, 1949, by Ambassador Jessup. Mr. Lattimore was also one of 25 private individuals participating in a round-table discussion on October 6, 7, and 8, 1949 arranged by the Office of Public Affairs for the purpose of exchanging views with informed private citizens on United States foreign policy toward China.

Allowing for duplications on the two lists, over 50 non-Departmental persons participated in the two projects. Included were former Ambassadors William Bullitt and Joseph Grew, General George C. Marshall, Harold Stassen and many other prominent and informed citizens representing many shades of opinion. Their opinions had never been treated or referred to as "instructions" until Senator McCarthy began to foreshadow his reiteration of the theme in March, 1950 when he referred to Mr. Lattimore as the "top adviser" of the Department.

As early as March 31, immediately after Senator McCarthy's references on the Senate floor to Mr. Lattimore, and long before his ASNE speech of April 20, the Department made public the full facts about the Lattimore memorandum. The names of the participants submitting memoranda were:

Former Consul General Joseph W. Ballantine, now at Brookings Institution.
Professor Hugh Borton, Columbia University.
Former President Isaiah Bowman, Johns Hopkins University.
Dr. A. J. Brumbaugh, American Council on Education, Washington.
Former Ambassador William Bullitt.
Former Under Secretary Castle.

Former

Former Consul John A. Embry
Professor Rupert Emberson, Harvard University
Dr. Charles B. Fahs, New York City
Professor John K. Fairbank, Harvard University
Dr. Huntington Gilchrist, New York City
Professor Carrington Goodrich, Columbia University
Former Under Secretary Grew
Colonel Robert A. Griffin, former Deputy Administrator, ECA China
Former Ambassador Stanley K. Hornbeck
Roger Lapham, Former Administrator, ECA China
Professor Kenneth S. Latourette, Yale University
Professor Owen Lattimore, Director of the Walter Hines Page School of International Relations, Johns Hopkins University
Oliver C. Lockhart, Export-Import Bank of Washington
Walter H. Mallory, Council on Foreign Relations
Professor Wallace Moore, Occidental College, Los Angeles
Professor Edwin O. Reischauer, Harvard University
C. A. Richards, Economic Cooperation Administration
Former Minister Walter S. Robertson, Richmond, Virginia
Dr. Lawrence K. Rosinger, New York, New York
Mr. James Rowe, Washington
Mrs. Virginia Thompson (Adloff), New York City
Professor Amry Vandenbosch, University of Kentucky
Professor Karl A. Wittfogel, Columbia University
Professor Mary Wright, Stanford University
Admiral H. E. Yarnell

The following, including Mr. Lattimore and some others of the 31 listed above, attended the Round Table at the Department October 6, 7, and 8 to discuss Far East Policy:

Joseph W. Ballantine, The Brookings Institution, Washington, D. C.
Bernard Brodie, Department of International Relations, Yale University, New Haven, Connecticut
Claude A. Buss, Director of Studies, Army War College, Washington, D. C.
Kenneth Colgrove, Department of Political Science, Northwestern University, Evanston, Illinois
Arthur G. Coons, President, Occidental College, Los Angeles, California
John W. Decker, International Missionary Council, New York, New York
John A. Fairbank, Committee on International and Regional Studies, Harvard University, Cambridge, Massachusetts
William R. Herod, President, International General Electric Company, New York, New York
Arthur N. Holcombe, Department of Government, Harvard University, Cambridge, Massachusetts
Benjamin H. Kizer, Graves, Kizer, and Graves, Spokane, Washington
Owen Lattimore, Director, Walter Hines Page School of International Relations, Johns Hopkins University, Baltimore, Maryland
Ernest B. MacNaughton, Chairman of the Board, First National Bank, Portland, Oregon
George C. Marshall, President, American Red Cross, Washington, D. C.
J. Morden Murphy, Assistant Vice President, Bankers Trust Company, New York, New York
Nathaniel Peffer, Department of Public Law and Government, Columbia University, New York

Harold S.

Harold S. Quigley, Department of Political Science, University of Minnesota, Minneapolis, Minnesota
Edwin O. Reischauer, Department of Far Eastern Languages, Harvard University, Cambridge, Massachusetts
William S. Robertson, President, American and Foreign Power Company, New York, New York
John D. Rockefeller, III, President, Rockefeller Brothers' Fund, New York, New York
Lawrence K. Rosinger, American Institute of Pacific Relations, New York, New York
Eugene Staley, Executive Director, World Affairs Council of Northern California, San Francisco, California
Harold Stassen, President, University of Pennsylvania, Philadelphia, Pennsylvania
Phillips Talbot, University of Chicago, Chicago, Illinois
George E. Taylor, University of Washington, Seattle, Washington
Harold M. Vinacke, Department of Political Science, University of Cincinnati, Cincinnati, Ohio

The full facts were reiterated, and again documented with the names of the individuals involved, in the Department's analyses of the Senator's ASNE and Chicago speeches. Despite this, Senator McCarthy has repeated this discredited charge on each occasion, and at Atlantic City repeated it again.

(5) <u>Senator McCarthy said at Atlantic City</u>: "I have presented to the Committee photostats showing that he (Dr. Jessup) belonged, that he was affiliated with not one, but with five Communist front organizations, and that he not only belonged to, but was a director, a director of one of the worst of the lot named as such by the Attorney General."

<u>The Facts</u>: Senator McCarthy has submitted no photostats as of this writing. Mr. Edward P. Morgan, Chief Counsel of the Tydings Subcommittee, to which Senator McCarthy said he gave "photostatic proof", has informed the Department:

"...We find no record of any material having been turned over to the subcommittee by Senator McCarthy indicating that Dr. Jessup has been associated with Communist front organizations.

"For your information, however, in the course of Senator Hickenlooper's examination of Dr. Jessup, he offered in evidence, at page 530 of the transcript, a photostat of a letterhead of an organization known as the American Law Student's Association on which 'Prof. Philip Jessup' of Columbia University is listed on the 'Faculty Advisory Board', along with other named individuals. The Subcommittee has been supplied no other documentary material concerning organizational affiliations or associations of Dr. Jessup.

"After hearing of Senator McCarthy's statements referred to above, I immediately called his office requesting the photostatic material to which he referred. Again on May 16, 1950, I called Senator McCarthy personally, advising that the subcommittee had not been supplied the photostatic material concerning Dr. Jessup to which he had referred and requested that he supply the same for our record. As yet, I have not been supplied the photostats in question."

The Department checked by telephone again today with Mr. Morgan's office. The photostats referred to by Senator McCarthy have not been received by it.

With

With regard to the general charge, this has been repeated and refuted at least three times. Senator McCarthy originally claimed that Doctor Jessup had an "unusual affinity" for Communist causes. Before the ASNE, he claimed Dr. Jessup was a "perennial joiner" and at Chicago he said the Doctor was a "great joiner" of Communist fronts. Doctor Jessup himself discussed Senator McCarthy's original charge in careful detail in his statement before the Subcommittee, and the Department refuted the ASNE and Chicago repetitions in its analyses of both speeches.

In renewing this charge at Atlantic City, Senator McCarthy added one innovation: that Doctor Jessup belonged to and was a director of "one of the worst" Communist fronts cited by the Attorney General. In a supplementary statement to the Associated Press on the same day, Senator McCarthy said:

"He was a director of one of the worst of such organizations named by the Attorney General, namely the China Aid Council of the American League for Peace and Democracy."

Ambassador Jessup is not and has never been a director of the China Aid Council. This charge evidently is based -- intentionally or carelessly -- on the fact that not Mr. Jessup, but his wife, was listed in 1944 as a Director of the China Aid Council. However, at that time, Mrs. Jessup was taking no active part in the work of the Council and attended no meetings. Prior to 1942, Mrs. Jessup had been active in the American Committee for Chinese War Orphans, formed under the sponsorship of Mme. Chiang Kai-Shek to raise money for orphanages in China.. This organization has never been cited by the Attorney General or the House Committee on Un-American Activities. In 1942 Mrs. Jessup turned her attention to the American Friends Service Committee in Philadelphia, for which she worked full time until 1946. Meanwhile, however, the China Aid Council absorbed the American Committee for Chinese War Orphans and continued as of 1944 to carry Mrs. Jessup's name on its letterhead.

Dr. Jessup is a member of a number of highly respectable non-communist front organizations, including Utica Post #229 of the American Legion, which, on April 6, 1950, resolved that the Post and its entire membership;

> "...strongly resent, condemn and decry the ... intolerable conduct of Senator Joseph McCarthy in his wanton attempt, without proof or reason, to smear and destroy the good reputation (of) Phillip C. Jessup... ."

(6) Senator McCarthy said at Atlantic City: "(This) publication was being supervised by Mr. Jessup (and) was being used to spear-head the smear against the anti-Communist forces in China... ."

The Facts: This twice refuted yet now reiterated statement refers to Dr. Jessup's association with the Institute of Pacific Relations and its publication, Far Eastern Survey. In the Department's analyses of the ASNE and Chicago speeches, it has been demonstrated that:

1. Senator McCarthy has merely parroted thoroughly discredited charges leveled by one Arthur Kohlberg against the Institute of Pacific Relations (an organization which the Rockefeller Foundation has referred to as "The most important single source of independent studies of the problems of the Pacific Area and the Far East").

2. Dr. Jessup never "supervised" the Far Eastern Survey.

(9) Senator McCarthy said at Atlantic City: "I have presented to the Committee checks totaling $3,500 which represent Communist money paid ... the Institute of Pacific Relations... . I have gotten photostats of additional checks which now total $6,500.00 of Communist money... ."

The Facts: The charge, expressed or implied, that the Institute of Pacific Relations was bought and paid for by "Communists" is among the most thoroughly refuted charges the Senator has advanced. The Institute of Pacific Relations and the Department have repeatedly presented the facts in careful detail.

Senator McCarthy's evidence consisted of photostatic copies of checks signed by Frederick Vanderbilt Field. Mr. Field's contributions to the Institute of Pacific Relations were made in the course of a campaign for funds sponsored by Mr. Juan Trippe, President of Pan American Airways, and Mr. Henry Luce, of Time, Life and Fortune. At the time, Dr. Robert Gordon Sproul, President of the University of California, was Chairman of the American Council of the Institute of Pacific Relations; Mr. Francis Harmon, Vice President of the Motion Picture Export Association, was Treasurer; and Mr. William R. Herod, now President of the International General Electric Company, was Chairman of the Finance Committee.

Characteristically, however, Senator McCarthy included among the new photostats shown at Atlantic City a $500 check from Fields payable, not to the Institute of Pacific Relations, but to the American Council on Soviet Relations. The American Council on Soviet Relations is a well-known organization listed as subversive by the Attorney General. The Institute of Pacific Relations is in no way related to it. The two organizations have never before been thus confused.

As pointed out in previous releases, the Institute's expenses averaged $100,000 a year; therefore, Mr. Field's $6,000 represented only a drop in the bucket as compared with total expenses of $300,000 for the three-year period.

Texts of Letters on the Lattimore Issue:

April 17, 1950

Dear General Marshall:

It has been stated by Senator McCarthy during the course of the hearings now being held by the subcommittee of the Senate Foreign Relations Committee under S. Res. 231, that Mr. Owen Lattimore is "the principal architect of our Far Eastern policy".

It is important for our committee to determine the truth of this contention for whatever bearing it may have on other evidence adduced in the Lattimore matter. For that reason, I would appreciate it greatly if you would inform me at your earliest possible convenience of the extent to which, in your opinion, Dr. Lattimore was "the principal architect of our Far Eastern policy" or the extent that Dr. Lattimore influenced our Far Eastern policy during the period in which you were Secretary of State.

I am addressing a similar letter to Secretary Acheson, Mr. Hull and Mr. Byrnes.

Thanking

Thanking you for your kindness in giving the committee this information, I am

Very respectfully,

MILLARD E. TYDINGS.

- - - -

April 22, 1950

My dear Senator Tydings:

I have received your letter of April 17 in which you refer to a recent statement, in connection with the hearings of the subcommittee on Foreign Relations under Senate Res. 231, that "Owen Lattimore is the principal architect of our Far Eastern policy". Your letter then asks the extent to which, in my opinion, "Lattimore was the principal architect of our Far Eastern policy" during the period in which I served as Secretary of State.

The statement referred to above is completely without basis in fact.

So far as I and my associates can recall I never even met Mr. Lattimore.

I take the liberty of commenting on the harmful effect on our foreign relations of such statements, charges or insinuations broadcast with so little regard for the truth. They undoubtedly confuse our friends abroad, undermine and weaken our position before the world and actually lend assistance to the powers that would destroy us.

Faithfully yours,

G. C. MARSHALL

- - - -

April 24, 1950

Dear Millard:

I have your letter of the 17th asking the extent to which, in my opinion, Mr. Owen Lattimore was "the principal architect of our Far Eastern policy" or the extent he influenced our Far Eastern policy during the period I was Secretary of State.

I do not know Mr. Lattimore. If he ever wrote me about the Far Eastern policy the letter was not called to my attention. If, while I was Secretary of State, he discussed our Far Eastern policy with any officials of the department concerned with that policy, in their discussions with me, they did not quote him.

Early in December, 1945, General George C. Marshall went to China and thereafter his reports to the President and me influenced our policies in China and the Far East. I do not think General Marshall was influenced by Mr. Lattimore.

To my former colleagues, I take the liberty of adding that, regardless of the merits of complaints as to what has heretofore occurred, the President and the Secretary of State have given proof of their desire to restore the bipartisan policy in our foreign affairs, and I earnestly hope the members of the Senate will cooperate in that effort.

While

While I was Secretary of State I found I could talk to Senator Vandenberg with the same freedom with which I talked to Senator Connally and to my assistants, and I profited by his advice. I am sure that in his absence other Republican Senators will cooperate just as did Senator Vandenberg. It is extremely important at this time, in view of the tenseness of the situation in world affairs, that we do not give to either our friends or enemies abroad the false impression of a serious division among us in our policies as to the Soviet Government. Seldom in history have our people been so united on any issue.

I hope that, regardless of our differences on domestic issues, our political leaders can present a united front in our foreign relations.

Sincerely yours,

JAMES F. BYRNES

- - - -

April 20, 1950

My dear Senator Tydings:

I have your letter of April 17 in which you inquire concerning the extent to which, in my opinion, Dr. Owen Lattimore was "the principal architect of our Far Eastern policy" or the extent he influenced our Far Eastern policy while I was Secretary of State.

In my opinion, he was in no sense the "principal architect" of our Far Eastern policy during the period I served as Secretary of State. Although his position in academic circles as a student of and writer on some aspects of Chinese life and history was, of course, known to us, I am not aware that during this period he had any appreciable influence on our Far Eastern policy. I do not remember having consulted with him on that subject or on any subject at any time.

Sincerely yours,

CORDELL HULL

- - - -

April 27, 1950

My dear Senator Tydings:

In a letter dated April 17, 1950, you asked that I inform you of the extent to which, in my opinion, Mr. Owen Lattimore was the "principal architect of our Far Eastern policy", or the extent to which he influenced our Far Eastern policy during the period in which I have been Secretary of State. On April 17 Mr. Peurifoy, Deputy Under Secretary of State, wrote you in full detail concerning Mr. Lattimore's connections with this department in the past. The Far Eastern policy of this Government, like all other foreign policy, is the responsibility of the Secretary of State and has been made by me in my administration subject, of course, to the direction of the President.

I welcome

I welcome this opportunity to state personally and categorically that during the period in which I have been Secretary Mr. Lattimore, so far as I am concerned or am aware, has had no influence in the determination of our Far Eastern policy. There is clearly no basis in fact for describing Mr. Lattimore as the "principal architect" of our Far Eastern policy. I might add that, so far as I am aware, I have never met Mr. Lattimore.

The Far Eastern policy of the United States has at all times been determined after careful study by the responsible officers of the department and an objective evaluation by me of all of the facts available to this Government. The Department of State has explored all avenues to arrive at the relevant facts. The measure of the participation of Mr. Lattimore, so far as this department and I are concerned, is fully and fairly indicated in the letter of April 17 from Mr. Peurifoy.

Sincerely yours,

DEAN ACHESON

United States Senate

MEMORANDUM

For Col. L. [illegible]

THIS PAGE IS DECLASSIFIED IAW EO 13526

DEPARTMENT OF STATE

FOR THE PRESS

JUNE 17, 1950
NO. 648

CAUTION
FUTURE RELEASE
NOTE DATE

FOR RELEASE AT 7:00 P.M., E.D.T., SATURDAY, JUNE 17, 1950. NOT TO BE PREVIOUSLY PUBLISHED, QUOTED FROM OR USED IN ANY WAY.

The Department of State made public the following analysis of some of the factual inaccuracies in the speech delivered by Senator McCarthy at Milwaukee, Wisconsin, to the Republican State Convention of Wisconsin on June 9, 1950.

Several misstatements which Senator McCarthy made at Milwaukee, he has repeated since in his speech of June 15 at New London, Connecticut to the Convention of the National Editorial Association. In particular, he repeated at New London the first misstatement dealt with here -- Senator McCarthy's perversion of the record of Secretary Acheson's position in the matter of the loan to Poland. The actual record of the Senate Committee which explored this matter is set forth in this release. He has also since repeated his assertions -- which are here once again shown false -- about United States policy with regard to Poland and China and about State Department files.

The analysis follows:

1. Senator McCarthy said at Milwaukee: "From October 1945, to March of 1947, Acheson's law firm was retained by the Communist government of Poland to obtain a 90 million dollar loan from the United States. The loan was put through and Acheson's firm received a fee of over 50 thousand dollars, according to Acheson's sworn testimony. During this time, Acheson was Assistant Secretary... He admitted in January 1949, that he was charged with responsibility of making that loan! Fifty million of that ninety million went to equip and arm the Communist army and the dreaded ... Communist secret police... It was Mr. Acheson who placed the guns, the whips, the blacksnakes and the clubs in the hands of those Communists. [and] ... who furnished them with bullets to keep a Christian population under Soviet discipline..."

The Facts: This charge, with its innuendoes, is utterly false and based on a deliberate distortion of the public record. The circumstances of the loan to Poland were carefully scrutinized by the Senate Committee on Foreign Relations in January 1949, prior to the confirmation of Mr. Acheson's nomination as Secretary of State. The Committee's hearings established that Mr. Acheson had severed all connections with his former law firm five years before the Polish loan was approved by the Department of State, that he acted on the loan only after it had been recommended by the various divisions of the Department, including Mr. Will Clayton's economic divisions, and the political divisions; and that the Department at that time still had hopes that the Mikolajczyk Government, then in power in Poland, might be saved from Russian domination.

Any

Any person really desiring the facts would carefully have examined the record of the Committee on Foreign Relations. The entire published record of this Committee's hearings dealing with this question is set forth below:

"The Chairman. There have been charges over the radio that there was some activity by that firm /Covington, Burling, Rublee, Acheson & Shorb/ with regard to a Polish loan while you were in the State Department. Can you tell us about that?

"Mr. Acheson. Yes, Mr. Chairman. I shall be glad to do that.

"The Chairman. I assume, of course, that while you were in the State Department you had severed your relationships with the firm as far as the receipt of any portion of their revenues as compensation.

"Mr. Acheson. On the 1st of February 1945 /subsequently corrected to February 1, 1941/, when I took the oath as Assistant Secretary of State, I severed all connection of any sort with my firm. The interest which I had in it was valued, computed, and paid to me by the firm, and I had no further connection with it until I returned to private practice on July 1, 1947.

"The Chairman. Was your name dropped from the firm?

"Mr. Acheson. My name was not dropped from the title of the firm. It was dropped from the list of partners who were connected with the firm. The name and style of the firm remained the same.

"The Chairman. Like many firms, they wanted the firm name to go on, as I understand.

"Mr. Acheson. That was the desire of my partners, a desire in which I acquiesced.

"The Chairman. But on the list of attorneys in the firm, your name was not included?

"Mr. Acheson. Certainly not.

"Senator Wiley. You had no financial interest in it?

"Mr. Acheson. No, sir.

"The Chairman. You were starting to tell us about the charge with respect to the Polish loan in which your firm, while you were in office, had some unusual interest. Tell us about that.

"Mr. Acheson. This matter, Mr. Chairman, was a matter which was begun and finished at a time when I had no connection with the firm whatever. In October 1945 the Polish Supply Mission employed the senior partner of that firm, Mr. Edward B. Burling, and some of his associates, to work with that Supply Mission in the drafting of contracts, papers, and so forth, having to do with a loan which the Supply Mission wished to make with the Export-Import Bank. That work continued from October 1945 until March 1947. It consisted in drawing up in legal form various conditions which were to be imposed to the granting of that loan. After the loan was granted and approved by the Export-Import Bank, there were various legal documents having to do with the nature of the payment and repayment, in which the firm assisted. After the loan began to be paid out, there were contracts which were made between the Polish Supply Mission and various suppliers in the United States. The firm assisted in that matter.

"In March 1947, after the President of the United States made a strong statement of disapproval of the activities of the Polish Government, the firm notified the Polish Supply Mission that they were no longer at its service.

"It has been stated somewhat extravagantly that the firm received in the neighborhood of a million dollars for its services. Its services for the period October 1945 to March 1947 were paid for on the basis of the time of the various people engaged in it, and the total fee was $50,175.

"The Chairman.

0281

THIS PAGE IS DECLASSIFIED IAW EO 13526

"The Chairman. No sir; it was not that.

"I think it would be appropriate at this points, in view of the charges that I had something to do with the granting of this loan, which was of benefit to a firm with which I had been connected, to state the facts in regard to that matter. The Polish Supply Mission and the Polish Government approached the United States in 1945 for two credits. One was a credit of $40,000,000 to be used for the purchase of coal cars. The other was a credit of $50,000,000 to be used for the purchase of surplus supplies owned by the United States, located in Europe. The matter of this loan was discussed with the Secretary of State, who was in Europe. It was discussed in 1945 and 1946.

"On April 24, 1946, at a time when I was Acting Secretary of State, the various division of the State Department, including the economic ones under Mr. Clayton and the political ones under the political officers, recommended that these credits should be granted on certain conditions. That recommendation was approved by me, and on April 24, 1946, a release was given stating what the conditions were and stating an exchange of notes between the Polish Government and the Government of the United States.

"Subsequently, some of the conditions imposed were, in the opinion of the Government of the United States, not fulfilled by the Government of Poland, and again, as Acting Secretary of State, I suspended the loan until those conditions were met.

"A matter which was not stated as a condition of the loan, but was a consideration which entered into the making of it, was that there should be free elections in Poland. Those elections were held. They were not regarded by the State Department or by the President of the United States as free elections. The President made a statement on that subject, and so did I. However, since this matter was not a condition to the loan, the loan was not again suspended.

"The consideration which led to the granting of $40,000,000 for the purchase of coal cars was the great necessity of supplying Polish coal to western Europe. That coal is now being supplied in very substantial quantities with the use of these cars.

"The Chairman. May I ask you one question: Did your former firm have any relation whatever to the policy matters that were determined, or was it purely a legal arrangement about these contracts and drafting of the instruments that were necessary to bring about the loan?

"Mr. Acheson. It was purely a legal matter, Mr. Chairman. The firm had nothing to do with the question of whether or not the loan should be granted.

"The Chairman. That is what I had in mind.

"Senator Vandenberg. At that point, Mr. Acheson, was it the policy of the Government to make the loans subject to these suspensions and reservations that you have indicated?

"Mr. Acheson. That was correct, Senator Vandenberg.

"Senator Vandenberg. Would these be the instructions also to our Ambassador at Warsaw?

"Mr. Acheson. I do not think I understand that question.

"Senator Vandenberg. To come right down to the bare bones of it, why would there then be a dispute, or an alleged dispute, between the American Ambassador at Warsaw, in respect to this thing and our representatives in Paris?

"Mr. Acheson.

"Mr. Acheson. There was throughout the consideration of this loan a difference of opinion between the American Ambassador in Warsaw and the officers of the State Department, including the Secretary and myself, who were charged with responsibility in it. That was a difference of view. It was one in which the unanimous opinion of the officers of the State Department was on one side and the Ambassador took a different view.

"It has been stated, and I have seen it in the press, that the Ambassador resigned on account of this loan. That is not the fact. The loan was made on the 24th of April 1946. The Ambassador resigned on the 31st of March 1947.

"Senator Vandenberg. Was this Polish Government, which your firm represented in this connection, what we would call a satellite government, or was it still a government which pretended--at least, through the cooperation of Mikolajczyk--to still be, in pretense at least, a coalition government?

"Mr. Acheson. It was the latter, Senator Vandenberg. This was the Mikolajczyk Government, and there was during that period, a hope that it might in some respects be free from complete Russian domination.

"Senator Wiley. I want to make an inquiry. I under stand, Mr. Acheson. that you claim that you yourself, personally, in no way profited from this transaction that your firm had; that at the time that the firm was engaged by the Government of Poland you had no legal or financial interest in the firm; that you had really stepped out from it; is that correct?

"Mr. Acheson. That is correct, Senator.

"Senator Smith. Mr. Chairman, might I ask another question in that connection?

"The Chairman. Yes.

"Senator Smith. Mr. Acheson, I understood you to say that in February 1945, when you became Under Secretary of State, you severed your connection with the firm. I also understood you to say that prior to that time, in 1944, if I have the figures correct, you were Assistant Secretary of State in other matters in the State Department. Were you an active member of your law firm during that period?

"Mr. Acheson. No. Senator. You misunderstood me, I think. What I believe I said was that on the 1st of February 1941 I entered the service of the Government. At that time, I severed all connection with my firm and did not reestablish any connection with it whatever until July 1947, when I returned to private life.

"Senator Smith. Thank you. That is what I wanted to bring out. I was not quite clear about that.

. . . . .

"Senator Tydings. I think you said in your direct testimony that at one time this loan was suspended. Is that correct?

"Mr. Acheson. That is correct, Senator Tydings..

"Senator Tydings. At that time, was your former law firm still representing the Polish Government?

"Mr. Acheson. Yes, sir; that is correct.

"Senator Tydings. Then it seems to be an inference that the steps and your part in the suspension of the Polish loan were adverse to the interests of your law firm. Is that correct?

"Mr. Acheson.

"Mr. Acheson. That is correct, Senator Tydings.

"Senator Tydings. I would like to ask you now if the first name in your firm does not represent the name of a man who is deceased, Mr. Harry Covington.

"Mr. Acheson. That is true.

"Senator Tydings. Isn't it a matter of fact that when a law firm is organized, in a matter of law, and any member dies or withdraws from the firm, that in the nature of the partnership the good will of the name itself, even though a member leaves the firm, the remaining partners can continue to keep his name as a part of the firm?

"Mr. Acheson. That is true, Senator Tydings. It is a very common practice.

"Senator Tydings. I think it is supported by numerous cases in the court.

"Mr. Acheson. I should believe so.

"Senator Tydings. Where a man leaves a law firm, the remaining partners are entitled to the good will created by the old name, and in case of death the same thing applies. It belongs to the partnership, and not to the individual once the good-will label is created. Is that correct?

"Mr. Acheson. I believe so. I can't answer authoritatively. I have not look it up.

"Senator Tydings. During the negotiations between the State Department and the Polish Government concerning this loan did your law partners at any time talk to you about the loan or urge its rejection, adoption, modification, or alteration?

"Mr. Acheson. No, Senator. I had no conversation with any of them of any sort.

"Senator Tydings. Then, when you severed your connection with your law firm as you have stated, during the time you filled the Government position, none of your partners or associates in your office in any manner, shape, or form contacted you to assist them in work that was in the office that might also have some connection in the State Department; is that correct?

"Mr. Acheson. That is correct, Senator.

"As I can recall it, and I think my memory is clear, in the 6 1/2 years in which I was in the State Department I had one call from one member of that firm, and that was to tell me that a client that he represented, who was an exporter of materials, would like to know whether the State Department would be pleased if that firm ceased exporting materials to Japan. I told him that the State Department would indeed be pleased at that action, and that action was taken, and I believe that is the only conversation on any matter of business which I had with any one of my partners in 6 1/2 years.

"Senator Tydings. That is all, Mr. Chairman.

"Senator Vandenberg. Do you think there is any chance for public misunderstanding through the retention, let us say, of the name of the Secretary of State in the title of a law firm?

"Mr. Acheson. I should think that there might very easily be, and it will be my recommendation to my partners that they would please me very much, and I think serve themselves, by dropping my name from the title of the firm." (The firm name now is Covington, Burling, Rublee, O'Brian and Short)

2. Senator

2. Senator McCarthy said at Milwaukee: "... I have here a limited number of photostats showing that the FBI gave the State Department a detailed chart three years ago showing that there were a total of 124 Soviet agents, Communists, Communist sympathizers and suspects in the State Department.... And ladies and gentlemen, in my book when the Federal Bureau of Investigation says these men are Communist agents, when the FBI sends over a formal report to the State Department saying we have the evidence, that to me is proof..."

The Facts: The Department, in a general statement on June 6 and in a detailed analysis on June 9, has thoroughly discredited the charge which Senator McCarthy here nevertheless characteristically repeats. In its analysis, the Department established that:

a. The FBI did not and has never submitted to the Department of State any such chart as that referred to by Senator McCarthy.

b. The designations on the chart in question were not made by the FBI nor were they based upon FBI evaluations of State Department personnel.

c. The chart in question was a mere work sheet prepared four years ago by subordinates in the Department's own Security office. The names it carried were those of Departmental employees concerning whom the Departmental Security office had at that time (May 15, 1946) received allegations appearing to warrant further investigations.

None of the persons whose names appeared on that chart are now employed by the Department except those whose loyalty has since been thoroughly checked, evaluated, and reviewed.

(Copies of the Department's June 6 and June 9 statements are available at the office of the Special Assistant for Press Relations, Mr. McDermott.)

3. Senator McCarthy said at Milwaukee: "I pointed out to the Senate four days ago that some of those men who the FBI listed as Soviet agents are still working in the State Department shaping our foreign policy at this very moment."

The Facts: What Senator McCarthy actually had said to the Senate four days before was that:

> "At least three of those listed as Communist agents by the FBI three years ago are still holding high positions in the State Department.... Those names I have checked and I know the persons are working in the State Department.... I... have the proof that those men are working in the State Department as of this very moment."

Instead of proof, Senator McCarthy now produces a watered-down version of his previous charge, which the Department also refuted in its statement of June 9.

In his speech to the Senate, Senator McCarthy further stated that the names of the three so-called "agents" still in the Department were also among the 106 submitted by him to the Tydings Subcommittee. In actuality, of a total of 20 persons hypothesized on the chart as "agents," there is only one who--after thorough reinvestigation, including a full FBI investigation, and clearance under the Department's loyalty and security procedures--is still

in

THIS PAGE IS DECLASSIFIED IAW EO 13526

in the employ of the Department. That one does not hold a "high position." His grade is GS-9. Furthermore, that one is not on the list of 106 which Senator McCarthy gave the Subcommittee.

4. Senator McCarthy said at Milwaukee (immediately after asserting that "untouchables" in the State Department were plotting the "Communistic enslavement of the world" and that the Administration was protecting "Communists and traitors in Government"): "As an example, I would like to give you the complete case proven on Dr. Philip Jessup, the State Department's Ambassador-at-Large.... This is the man who, under the guidance of Lattimore, is determining to a large extent our Far Eastern Policy.... The documentary evidence shows that Jessup belonged to five organizations which had been officially declared as fronts for and doing the work of the Communist Party..."

The Facts: On the Senate floor on June 6, and under the protection of his Senatorial immunity, Senator McCarthy had gone even farther--he virtually said that Ambassador Jessup was a member of the Communist Party:

> "Their /The Communist Party's/ top aim was to get some of their members on that Executive Committee /of the Institute of Pacific Relations/, to control that. For example, we find Frederick V. Field, we find Philip C. Jessup, and Harriet Moore, a very well known Communist."

Ambassador Jessup, in his testimony before the Tydings Subcommittee, demonstrated the complete falsity of Senator McCarthy's allegations, and the Department has repeatedly set forth the facts--particularly in its analysis, on May 27, of Senator McCarthy's May 25 speech at Rochester, New York, and of the various documents which he presented at that time as "evidence."

These facts demonstrate not only that Ambassador Jessup has never belonged to the Communist Party or been in sympathy with it, but that, of the organizations referred to by Senator McCarthy, Ambassador Jessup has never belonged to a single one which had been cited by the House Committee on Un-American Activities or by the Attorney General as a Communist front. Of the six organizations named by Senator McCarthy and in his documents, two are organizations with which Ambassador Jessup has had no connection, and two are not Communist fronts at all. As for the fifth organization, Ambassador Jessup signed a "call" which resulted in its formation but had no further connection with it. For the sixth, he was listed among the many sponsors of two dinners which he himself did not attend.

5. Senator McCarthy said at Milwaukee: "So far, those who object to our methods in this present fight have offered as their only alternative that we go back to the method used for the past sixteen years during which the Communists have been permitted to take control of our State Department, infiltrate our government, and work with the Soviet Union to accomplish the two major Russian aims:

"1. To create a Red China; and

"2. To create a Red Poland."

The Facts:

The Facts: The Department of State has strenuously objected to the methods adopted by Senator McCarthy. The objection stems from the irresponsible and destructive approach which the Senator has seen fit to adopt in his attacks. The Department has actively solicited constructive suggestions and criticism from the Congress, private organizations and individual citizens regarding the conduct of our foreign relations, so that the policies of the Department may be as representative of the best thinking of the American people as possible. Senator McCarthy's repeated misstatements concerning the Department and its policies obviously do not fall into this category.

In Poland, the Department did everything in its power to bring about free elections and the establishment of an independent democratic government. That this effort so far has been unsuccessful is strictly attributable to the realities of the situation which Senator McCarthy deliberately ignores; viz., the geographic proximity of Poland and the Soviet Union combined, with the political blackjack of scores of Red divisions in and around Polish territory. Soviet intransigence left the United States Government only the alternative of force which even Senator McCarthy, under the circumstances, might hesitate to recommend.

In China, the United States Government poured out billions of dollars for economic, fiscal and military assistance of the anti-Communist forces. This effort was frustrated by the fact that there ultimately ceased to exist in China any political entity with the organic integrity and determination to combat communism on a scale which would make further support practical and effective.

6. Senator McCarthy said at Milwaukee: "For nearly 20 years we have allowed dilettante diplomats to do the 'fighting' for us with kid gloves in perfumed drawing rooms..."

The Facts: The members of the United States Foreign Service are drawn from all States of the Union and from all walks of life. Angus Ward, Consul General in China, for almost a year imprisoned with his staff of 18 by the Chinese Communists, saw none of Senator McCarthy's imaginary perfumed drawing rooms. He and his people suffered real hardship in real risk of their lives. Departmental observers were frequently under fire during the Greek Civil war and similarly exposed in the war between the Israeli and the Arabs for Palestine. Consul General Thomas Wasson was killed by a sniper in Palestine in 1948. Officers assigned to certain posts in Southeast Asia are required by Departmental order to carry firearms for their personal protection. Out of some 8,000 officers in the Foreign Service, about 2,000 are veterans. Senator McCarthy is simply repeating, here, frayed cliches based on ignorance or malice.

7. Senator McCarthy said at Milwaukee: "This letter /from the Secretary of State to Representative Sabath/ shows that the Department insisted on hiring 205 individuals who had been declared unfit...by the President's own Security and Loyalty Board... I told him /the President/ I had the names of 57 individuals whose files would indicate that they were with Communists or loyal to the Party...My continual investigation has increased that list to 81... I have given them 25 more names, totaling 106... The FBI gave the State Department a detailed chart... showing that there were a total of 124... two months later 106 ... were still working in the Department..."

The Facts: At Wheeling, West Virginia, on February 9, 1950, Senator McCarthy asserted in a Lincoln Day address:

"... While

"...While I cannot take the time to name all the men in the State Department who have been named as active members of the Communist Party and members of a spy ring, I have here in my hand a list of 205--a list of names that were made known to the Secretary of State as being members of the Communist Party and who nevertheless are still working and shaping policy in the State Department."

The next day, he said he had the names of "57 card-carrying members of the Communist Party" allegedly working in the Department. Later he talked in terms of 81 security risks of various sorts. Then he said he would stand or fall on his ability to prove that there was one "top espionage agent" in the State Department. Recently he has directed his attention to the Civil Service clearances, seven years ago, of two Chinese for Office of War Information employment. Reverting to his numbers game, he now injects a new "106," paired with another big "3".

To date, Senator McCarthy has utterly failed to prove that there is a single Communist or pro-Communist in the State Department.

8. Senator McCarthy said at Milwaukee: "He. /President Truman/ announced that he would make available not all of the files, but the loose leaf, raped and denuded State Department files in some of the cases--files which, according to a House Committee report based on an FBI survey, had been extensively tampered with."

The Facts: Here Senator McCarthy dishes up once again a previous assertion already refuted by the Department--most recently in its May 25 analysis of the Senator's May 15 speech in Atlantic City.

As the Department then pointed out, these files are now as rigidly controlled, accurate, and complete as it is possible to make them. The files delivered to the Subcommittee are complete files--State Department reports, FBI reports, interrogations, hearings, administrative memoranda, even pencilled working papers--everything. On May 10 when the committee started examing the files, Senator Tydings is quoted as having said:

> "These 81 files contain not only all of the data which the State Department investigators have assembled, but also all of the loyalty data which the FBI has gathered and referred to the State Department and which has been made a part of these files.
>
> "Thus the Committee will have the complete record from all sources..."

9. Senator McCarthy said at Milwaukee: "It is the Lattimore-Acheson plan for Soviet conquest of the Pacific... This is what he/Owen Lattimore/ says...This...by the architect of our State Department Far Eastern Policy...Lattimore's master plan...bought lock, stock and barrel by Acheson... The Lattimore-Acheson axis served the purpose of the Kremlin..."

The Facts: Both the State Department and Mr. Lattimore himself have repeatedly reiterated the falsity of these assertions. Mr. Lattimore is not an employee of the State Department and is not the "architect" of its Far Eastern policy. Senator Tydings asked Secretaries Hull, Byrnes, Marshall and Acheson whether such a characterization of Mr. Lattimore was true or false. They all replied that it was false.

10. Senator

0288

THIS PAGE IS DECLASSIFIED IAW EO 13526

10. Senator McCarthy said at Milwaukee: "This is the Acheson who reinstated and put in charge of personnel in the Far East, John Stewart Service..."

The Facts: The following letters from the then Secretary of State, Mr. James F. Byrnes, and former Undersecretary Joseph C. Grew clearly set forth the circumstances of Mr. Service's reinstatement to the Foreign Service--by Secretary Byrnes on the recommendation of the Foreign Service Personnel Board:

"August 14, 1945

"My dear Mr. Service:

"I am advised that the Grand Jury, after hearing the testimony of witnesses, has found nothing to warrant an indictment against you.

"One of the fundamentals of our democratic system is the investigation by a Grand Jury of criminal charges. By that process you have been cleared.

"I am advised that at the time of your arrest you were placed on leave of absence with pay. I am happy to approve the recommendation of the personnel board that you be returned to active duty. You have now been reassigned to duty in the Department for important work in connection with Far Eastern Affairs.

"I congratulate you on this happy termination of your ordeal and predict for you a continuance of the splendid record I am advised you have maintained since first you entered the Foreign Service.

"With all good wishes,

"Sincerely yours,

"JAMES F. BYRNES

"John S. Service, Esquire,
"American Foreign Service Officer,
"Department of State,
"Washington 25, D.C."

- - -

"August 14, 1945.

"Dear Service:

"The Secretary has just told me of the letter he has written you expressing his pleasure at your complete vindication. I just want to add a personal word of my own.

"When I learned, only a few days before your arrest, that your name had been coupled with thefts of official documents I was inexpressibly shocked. Having known you for some time and of the high calibre of your work I could not believe that you could be implicated in such an affair. As the Secretary has stated, you have been completely cleared of any such imputation by operation of our democratic machinery of investigation and law enforcement.

"I am

"I am particularly pleased that you are returning to duty in the field of your specialization, Far Eastern Affairs, where you have established an enviable record for integrity and ability.

"With all good wishes,

"Sincerely yours,

"JOSEPH C. GREW.

"John S. Service, Esquire,
"American Foreign Service Officer,
"Department of State,
"Washington 25, D.C."

Mr. Service has never been in charge of personnel in the Far East. At the end of 1948, Mr. Service was assigned to the Department in line with the established policy of rotating Foreign Service officers and bringing back to the United States those who, like Mr. Service, have spent considerable time in the field. For three months in 1949, Mr. Service served on the Foreign Service Selection Board, which includes public as well as governmental members. The Board recommends promotions throughout the Foreign Service, but it does not deal with assignment and is not in charge of field personnel in the Far East or anywhere else. During the remainder of his Washington assignment in 1949, Mr. Service served as a special assistant in the Division of Foreign Service Personnel but had nothing to do with appointments or assignments in the Foreign Service. He has never been in charge of the Foreign Service personnel in the Far East.

11. Senator McCarthy said at Milwaukee: "...Jessup was in charge of the publication of a Communist front known as the Institute of Pacific Relations. This publication under Jessup spearheaded the Communist Party line and spewed forth the Communist Party line perfumed sewage... This publication was supported by Communist money. Along with the material being furnished you are photostats of checks totaling $6,000, all signed by the self-proclaimed Communist, Frederick Vanderbilt Field."

The Facts: Once again--as it has done following each of Senator McCarthy's ASNE, Chicago, Atlantic City and Rochester speeches--the Department states these facts:

a. Senator McCarthy grossly exaggerated Dr. Jessup's relationship with Far Eastern Survey, the publication to which he refers, based on the single fact that in 1944 Dr. Jessup served on the Research Advisory Committee of the American Council of the Institute of Pacific Relations.

b. As for Senator McCarthy's charges and implications that the Institute or its publication were bought and paid for by "Communist money," about half of the Institute's budget was met by the Rockefeller Foundation and the Carnegie Corporation. Mr. Field's contributions were only a drop in the bucket as compared with the generous donations of large industrial concerns.

Senator McCarthy in previous speeches, had claimed to have "evidence" of contributions from Mr. Field totaling $6,500 in two years. Significantly, however, following the Department's exposure of the fact that one of the photostated checks included in that "evidence" was payable, not to the Institute of Pacific Relations, but to the American Council on Soviet Relations, a totally unrelated organization, he now reduces his figure to $6,000.

In 1941,

In 1941 Ambassador Jessup was Vice Chairman of the American Council of the Institute of Pacific Relations. Ray Lyman Wilbur was Chairman. The Treasurer was Francis S. Harmon. In addition to Henry R. Luce, of Time - Life - Fortune, William R. Herod, President of the International General Electric Corporation, Phil Parker, of the Standard-Vacuum Oil Company. and other outstanding bankers, industrialists, lawyers, etc.

For the 1942-43 period, the persons responsible for overall and financial affairs included the same distinguished names referred to many times before -- Dr. Robert Gordon Sproul, President of the University of California; Mr. Francis Harmon, Vice President of the Motion Picture Export Association; Mr. Herod; Mr. Juan Trippe, President of Pan American Airways, and Mr. Luce.

MEMO FOR THE RECORD AND NOTES ON
RICHARDSON PAPERS BY COL. NITSCHE

6-A137-A
-44

THIS PAGE IS DECLASSIFIED IAW EO 13526

?0 Jan 1962

Brigadier General Noel F. Parrish
Director, Research Studies Institute
Air University
Maxwell AFB, Alabama

Dear General Parrish

The enclosed "Richardson" file is forwarded per Gen Page's letter to you of 29 December and our discussion of several weeks past. The files have not been screened for applicability. It seems that we have gone from one higher priority project to another.

It is my opinion, based upon very rapid screening, that they should be looked at very closely before being published. If you will recall, many of these were written by General Richardson in what might be called a transition period. Perhaps a better way of explaining it would be to say that things or ideas occurred at a rapid rate and were not necessarily related to one another.

It is my understanding that Col Abbott's shop (Long Range), and specifically Sy Molyneaux, is responsible for maintenance of the permanent Richardson file. Since I am not in a position to express a Plans opinion in the conceptual field, it might be well for whoever takes on this project in your office to direct queries to Long Range.

Although these papers are not classified -- not even marked For Official Use Only -- I have nonetheless sent them to you by registered mail, believing that there just might be some sensitive areas, or treatment of areas, which might require some safekeeping until final determination can be made.

Sincerely,

DONALD F. MARTIN
Lt Colonel, USAF

THIS PAGE IS DECLASSIFIED IAW EO 13526

MEMORANDUM FOR RECORD 29 June 1962

Colonels Hill, Snyder and Nitsche have, collectively, reviewed the Richardson legacy papers in its entirety. The purpose of this m/r is to indicate the status of the project at this time.

On my most recent two trips to Hq USAF in late April and May of this year, I discussed the file at some length with Col Tom Abbott, Col Bill Smith, and Lt Col Paul Deems. Even though several of the papers were updated (No. 3, 14, 18, and 20 as shown on the index) by Col Abbott's people, several months earlier, at the time of my visits the interest in the file itself and in the subject matter it contained definitely was not a priority matter. Even when asked which of the papers might possibly be of use in anticipated or current Air Staff actions, we were not able by refering to the index to identify any in this category.

Col Snyder intends to discuss certain of these papers with Gen Richardson when they visit his headquarters as a part of the trip in which he and Col Frazier are accompanying Gen Parrish. It may be that certain of these papers will then have renewed ~~inst~~ interest or perhaps that Gen Richardson may introduce still others into the group. However, unless this

THIS PAGE IS DECLASSIFIED IAW EO 13526

is done there is no information which has come to my attention xjxx that would suggest any action can be anticipated within the predictable future on the current Richardson legacy papers.

Where appropriate comments have been penciled into the margin concerning content. While it was considered somewhat presumptious to attempt to assign a military security classification to these papers where appropriate -- particularly since they have passed through a great many hands previously and the individuals who reviewed them apparently did not see fit to assign security classifications -- it is my view, however, that the file should continue to be afforded protection from a military security standpoint equivalent to that required for SECRET information. Most, if not all, of the information contained in these papers probably has appeared inprint somewhere at some time in an unclassified form. Nevertheless, x when these several pieces of presumably unclassified information are put together in one package they at least tend to create an additional bit of information which in my view xxxxx at any rate does not qualify as unclassified in all cases. It was not considered appropriate during the time the file was active to indicate all instances where possible military security classification might be involved.

THIS PAGE IS DECLASSIFIED IAW EO 13526

I recommend that the file be retained in a dormant state within the Concepts Division unless or until some notification from outside RSI causes one or all of the Richardson papers to become a matter of current interest.

Should the subject matter become active, I believe Col Snyder is the most knowledgeable person concerning the subject matter and the historical developments concerning the review of the Richardson legacy papers.

JOHN E. NITSCHE
Colonel, USAF

Colonel Nitsche's notes on Richardson Papers.

On Index --"S" on items refers to Colonel Smith in War Plans, Hq USAF. These papers are ones which were updated as to content but not as to language by Colonel Smith and Colonel Paul Deems several months ago. Copies of revised papers are contained in file.

Where letters "AFOS" are used, refers to table of contents of the AF Objective series papers dated 12 December 1961, contains titles similar to those used by General Richardson.

Make new index -- original + 3.

"A", "B", "C" on papers 1-37 on 12 Feb index were received from the Air Staff under a cover letter by L/C Martin about the same time the three which were originally numbered A, B, C, later 38, 39 and 40 were received directly from General Richardson in a letter to General Parrish.

Those that are shown as numbers 41-45 were received subsequently from General Richardson in letters to General Parrish but because they were concerned directly with the paper on which Colonel Snyder was working, they were refered to him rather than to Colonel Nitsche. Shortly before Colonel Snyder departed on his trip to Europe with General Parrish, he turned over these papers to Colonel Nitsche with notation that General Parrish had indicated no further action was appropriate.

(1) Alternative "Sword" Strategies for Consideration by the US

THIS PAGE IS DECLASSIFIED IAW EO 13526

Strategies for Consideration by the US

K-A139-1

THIS PAGE IS DECLASSIFIED IAW EO 13526

AN ANALYSIS AFXPD-LR

of

ALTERNATIVE "SWORD" STRATEGIES FOR CONSIDERATION BY THE US

The developments discussed in other parts of this paper suggest that the United States must now determine a security policy for the missile era which fully takes into account new Soviet strategic capabilities, the emergence of other atomic powers, and the growing weaknesses in the current concept that relies wholly on the United States will and ability to retaliate with our general war forces in response to any and all acts of aggression. Additionally, any new strategy must leave the United States increasingly free to devote time and resources to space. These are the requirements that dictate a change in the present concept.

Three courses of acttion - potential Free World Security concepts - have been proposed to meet the above requirements. These are basically variants of the current sword and shield relationship.

One solution would be to create a Supreme Allied Strategic Command, for free world deterrence and retaliation and to pool all strategic forces, as they develop, under collective (NATO?) control.

Another solution would be to provide NATO in Europe (SHAPE) with its own regional strategic retaliati on and deterrent capability, while retaining the United States capability under unilateral control, but trying to persuade the U.K. and France to put their atomic contributions into the SHAPE effort, or failing in this accepting their unilateral existence.

A third solution would be to accept the development of unilateral French, British, and later, other allied strategic deterrent and retaliatory forces, and to seek to associate these with the allied shields of NATO, SEATO, and CENTRO, in coordinated plans and in the same manner that SAC has been committed to support the shield effort to date.

These are the alternatives. A fair evaluation of the pros and cons of each now seems desirable to determine the best Free World security strategy for the missile era, 1960 to 1970.

The concept of graduated deterrence, or similar ideas that envision seperate and overlaping resources to fight all levels of aggression is not considered an alternative worth considering for the reasons set forth in Section VIII.

THIS PAGE IS DECLASSIFIED IAW EO 13526

COLLECTIVE STRATEGIC DETERRENCE

The concept of Collective Strategic Deterrence envisions the establishment of an Allied (NATO) Strategic Command (ASC). This command would be parallel on the chart to that of SACLAND and SACEUR. It would group under it all of the Free World strategic delivery systems, to include U.S. systems in SAC, Polaris, carriers with a strategic role, the British V-Force and any new strategic delivery systems developed by Nth Countries such as the France planned French "Fore de Frappe."

This concept has been proposed from time to time. It has never been thoroughly studied since, on initial analysis, it seemed unlikely that we, the United States, would agree to the surrender of control over the commitment of our strategic forces to an inter allied authority. Additionally an allied strategic command would lead to insolvable atomic law and security problems.

This concept has merit if one believes that the future of the Free World depends on increasing collaboration in defense matters as a necessary step towards establishing as Atlantic community, and further, if one believes that any alternative is better than to permit the growth of independent national strategic capabilities even within the large and responsible powers who are now members of the Alliance.

Arguments in Favor of the Establishment of an Allied Strategic Command

Our Allies, particularly in NATO, have always resented the unilateral control enjoyed by the U. S. over the free world's principle strategic forces. Both the British and French have indicated from time to time that they would to have some say in the employment, deployment, and use of these units.

Their arguement is that any war that might result from this use will effect them as much as it will us.

The U. S. has always resisted this. There appears to be no doubt but what this U. S. attitude has been a major factor, and an incentive, in the development of national atomic capabilities in both France and England. It can be said, therefore, that were the U. S. to surrender this control, even nominally to an Allied authority such as the NATO Council, allied solidarity and relationships would be improved.

Purely from a military organization point of view, the establishment of an Allied Strategic Command which would group all resources for strategic war is sound. It would place strategic targeting, as well as operational control of the strategic forces of all services and nations under one commander and in one staff. It would, therefore, maximize coordination and operational effectiveness and minimize duplication and waste, particularly in targeting, and in the development of weapon systems.

From a psychological, public relations point of view, the pooling of free world strategic resources under allied control would be a popular move in Europe. On the other hand, it could well be construed as reducing the security of nations in the Far and Near East who did not enjoy membership in NATO and, hence, would not have a say in the use of the strategic effort on their behalf. These countries would rationalize that the U. S. might commit its strategic resources to the defense of Far Eastern countries under some circumstances in which the European nations of NATO would not agree to their use.

The principal advantage of the establishment of an Allied Strategic Command in NATO would seem to be the impact this would have on the so-called

Nth Country problem. Obviously, such a command could not be established unless all NATO countries agreed to pool any strategic nuclear resources they might develop. This would mean, for practical purposes, the elimination of the so called Nth Country prospect, and the establishment of maximum stability over the use of strategic nuclear forces.

<u>Arguments against the Establishment of an Allied Strategic Command</u>

The principal argument against the establishment of an Allied Strategic Command stems from the resulting loss of unilateral U.S. control over forces which we require to insure our basic survival.

It seems highly unlikely that the U. S. Government, or the Congress, would agree to surrendering its authority over these forces in time of peace. Therefore, even if one could make a theoretical case for this concept as a solution to our present Free World defense problems, it does not appear to be practical solution. Atomic Security laws alone would make its implementation difficult if not impossible for at least five to ten years.

There are countries outside NATO that depend upon the U. S. strategic capability to deteraggression against them, or to assist them in the event of aggression. While our commitment to these other countries, particularly in the Far East, is less categorical than our commitment to NATO, the principal of "Sword and Shield" still applies in their minds as well as in ours. In view of this, any surrender of control over the U. S. strategic forces, or any major portion thereof, to the North Atlantic Treaty Organization would be paramount to withdrawing the allocation of these forces to the support of other major segments of the shield such as SEATO and CENTRO, whose countries are not members of the NATO Council. These countries would feel

THIS PAGE IS DECLASSIFIED IAW EO 13526

that such an act had reduced their potential to deter aggression and that it would lead to invitating the Chinese to attempt limited aggression without fear of our retaliation.

The principal U. S. national objective is to deter wars, both general and limited. The placing of our strategic forces under collective political control would weaken the deterrence of war since it would dilute the decision mechanism.

If ever the Russians entertain a plan for a limited act of aggression, they have to consider the response the U. S. is likely to make. While they may feel that we would not respond with our strategic atomic forces to some particular act of limited aggression, they must remember that they also felt we would not respond at all in Korea, in Greece, and in Lebanon. Based on these experiences, they must think that even though it may seem illogical, our immediate response to any soviet act of aggression is within the powers of one individual, the President, and this individual could well decide that the time had come to honor our commitments to our allies and order the strategic effort to retaliate, provided he had sole control over the decision as is now the case.

On the other hand, should the U. S. strategic forces come under allied control, the Soviet could be reasonably certain that their use in response to many limited acts of aggression would only take place after extensive debate in Allied (NATO) Councils. Under these conditions they would logically assume that those nations not effected by the limited act of aggression would actively oppose the use of the Allied strategic arms. The resulting debates and delays would open the question of use or non-use to public and Congressional argument in the United States. Under these circumstances,

there would be little or no risk from the Soviet point of view of sudden and quick act of retaliation which would give our strategic effort the advantages of a pre-emptive strike on the Soviet long range nuclear forces.

It seems quite clear, therefore, that were we to surrender unilateral U. S. control, over the use of our strategic forces to allied direction, we would greatly weaken our deterrent to limited aggression, if not to general war.

Another argument against the establishment of an Allied Strategic Command in NATO is that it would probably lead to unduly weakening the Shield forces in all areas. This would result from the fact that many countries maintain their contribution to the Shield at a high level due to the realization that the probability of the U. S. using its strategic forces on their behalf would vary with the size and intensity of the act of aggression. This being true, a certain level of Shield force is required to trigger the U. S. effort.

If all NATO nations participated in the direction of the Free World strategic capability, many would quickly rationalize that they could risk to reduce their shield forces to roughly the equivalent of the lowest common denominator level, since in the last analysis they would have a say in whether or not the strategic forces were committed in their defense. As such, they would not have to hedge against this possibility by providing more local force than they desire to fund and support for economic and political reasons. This would lead, in effect, to the adoption of a collective massive retaliation complex within NATO and to reductions in local defense forces to an unsafe level and undue reliance on strategic retaliation for even minor acts of aggression.

In Summary

The advantages of a concept of collective security for the 1960-1970 era are more than offset by the disadvantages. It is also unrealistic to assume that such a concept could be acceptable to the U.S. Congress in this time frame even if it could be demonstrated as desirable. This solution to our National Security Strategy in the Free World deterrent area is therefore rejected.

U. S. UNILATERAL AND ALLIED COLLECTIVE DETERRENCE

Some have suggested that the Nth Country problem, and the problem of allied credibility in our strategic retaliation in the event of local aggression, could both be solved if SACEUR were given a capability to attack some strategic targets in the U. S. S. R.

This concept involves providing NATO (SACEUR) in Europe with intermediate or long range ballistic missiles, initially Polaris. Its proponents assume that in return for our placing a few of these weapons under the allied control of SACEUR and NATO, the major allied nations in Europe, particularly France and England, can be pursuaded to surrender to SACEUR's (NATO) control any national nuclear delivery forces they have or develop. Let us examine the advantages and disadvantages of this concept.

Arguments in Favor:

If one rejects as unrealistic the assumption that France and England will be willing to surrender their national atomic forces to SACEUR's control, without the U. S. doing likewise, then there are really only two valid arguments in support of this concept.

The first argument stems from the growing tendency among NATO nations to feel that they need not "hand together" in order not to "hand separately" in a future general war. With the advent of ICBM and space systems some now see the possibility of a general war between the U.S. and the U.S.S.R. in which small peirpheral powers could sit on the sidelines as spectators who could contribute little towards victory but save themselves from loss and devastation by neutrality. A prerequisite to this outcome from their point of view is to disengage from the U.S./Soviet conflict by eliminating from their soil weapon systems which might invite attack by either side in such a bilateral general war.

Since the above trend is a divisive influence in the NATO alliance, and weakens our collective defense efforts, there are those who would deploy strategic systems within NATO nations at any cost in order to insure that in the event of a general war, those countries would also be hit and, hence, must remain inevitably committed to participate with all their resources, facilities, and bases on our behalf.

The second argument for this concept is one that stems from the first. It suggests that the provision of strategic weapons to SHAPE, and to NATO through SHAPE, would add prestige to SHAPE and to NATO at a time when the prestige of the military alliance is decreasing. Basically this was the concept behind the IRBM offer. The IRBM offer never had the blessing of the U. S. Joint Chiefs of Staff when it was made to the NATO Council, nor was it ever determined as a military necessity. It was made by agreement between the President and the Secretary of State with a view to bolstering NATO morale and NATO capability at a time when these were particularly low as a result of the Soviet Space developments.

Arguments Against:

The arguments against the provision of strategic capability to SACEUR seem to be overwhelming even though the trend towards this course of action continues.

First of all, providing a strategic capability to NATO in Europe will add exactly nothing to Free World deterrenc. No one, least of all the Russians, could conceive of the U. S. agreeing to let SACEUR retaliate against Russian targets without our concurrently attacking with our own strategic forces.

THIS PAGE IS DECLASSIFIED IAW EO 13526

Since SACEUR is a U. S. officer, and since we also have a vote in the NATO Council, there is no danger NATO in Europe could hardly launch an attack without U. S. agreement. If the U. S. were to agree and attack simultaneously, it is quite clear that we would use our own, more effective, strategic forces on all primary strategic targets rather than rely on systems manned by allies, or even under allied control, for their destruction.

Another major weakness of this concept is that it sould no doubt detract from the shield effort, as it has already done in the case of the Thor/Jupiter units. The military assistance money that went into the IRBM program could have been much better employed had it been used to augment or modernize U. S. or allied shield forces. At present, SACEUR's forces are short of the MC-70 goal, his Air Forces are highly vulnerable for lack of funds to provide adequate hardening or dispersal, his land forces lack modern equipment; yet, at present SACEUR seems to be, as king for missiles to hit Russia - i.e., to participate in SAC's job - when he can't even meet his own minimum requirements to do his assigned defense "shield" task.

Once we start mixing up the task of the "shield" that is the task to "hold and defend", with the task of the "sword", - to conduct the offensive war against the U.S.S.R. - while at the same time retaining full unilateral national capability for the latter task, we will so mix up functions and allied versus national roles that the ensuing problems will far exceed any benefits that might be derived.

The conduct of an effective strategic war against the U.S.S.R. demands global coordination of strategic capabilities. The range and nature of the equipment involved does not permit its distribution to areas or theater command seeks to attack it at the same time.

The need for global targeting in the strategic field has been recognized not only by the Air Force, but more recently by the Secretary of Defense in his decision to assign these responsibilities to the Commander of the Strategic Air Command. This being true, any solution to the Free World problems of Nth Country, ani credibility, that involve spreading our strategic resources among more commanders instead of centralizing them under one commander will reduce their effectiveness. Such solutions would clearly violate the global control essential to a sound strategic campaign.

The provisions of a strategic capability to SACEUR would be wasteful and would duplicate the U. S. resources. It has already proved wasteful in the case of the Thor/Jupiters since, to our knowledge, the presence of thes in Italy and England has not been credited by Europeans with solving any of their problems nor has it allowed us to reduce in any way our U. S. capability. So long as the U. S. will not surrender its national capabilities to wage an effective war to allied control we will have to retain a full measure of forces even though it duplicates allied forces. Thus, if the reasons set forth in SECTION V above for not surrendering the U. S. capability to NATO control are valid, then the same reasons are equally valid for not reducing the U. S. capability below the level of a complete and rounded out force able to act with or without concurrent participation of any forces under control of SACEUR.

The provision of a strategic capability to SACEUR will in no way solve, or prevent, the Nth Country problem. Notwithstanding the fact that some people seem to think that France and England would desist from their strategic development in this event, every evidence is to to contrary. In fact the nations concerned have clearly stated that they have no intention whatsoever of surrendering their national strategic efforts to a combined NATO effort under SACEUR control.

Summary:

The provision of a strategic retaliatory capability to NATO forces in Europe (SACEUR) will not solve the free world security problems and should be rejected as a solution.

The current tendancy to do this - which seems to have its base in the desires of some services to reduce the cost of U. S. - SAC by spreading the counter-force aspects of its mission to theater commands and reducing the global inter continental capability to a minimum deterrent force should be resisted.

SACEUR's requirements should be limited to modernizing his shield forces - which include gradual provision of a tactical missile for use against theater targets but does not include ICBM's or IRBM's with which to target Moscow or Soviet forces of any type in Russia proper.

THE CONCEPT OF MULTILATERAL "SWORDS"

1. The concept of multilateral "swords" continues the currently successful "Sword and Shield" relationship, but accepts the gradual evolution of the strategic retaliatory sword element from a primarily U. S. effort into a closely coordinated but separately controlled multiple effort. Each new strategic deterrent force will be committed to, and related with, the shield effort in the same manner as is now the U. S. effort.

2. This concept accepts, on the one hand, the basic principle of the heretofore successful "sword and shield" concept, and on the other hand, the inevitable development of atomic capabilities by other nations in the 1960-1970 era. Instead of resisting these principles and trends, it seeks to exploit them for the best interest of the Free World.

3. The development of more than one strategic "Sword" within the Free World has many advantages:

a. It is a logical follow-on, as other nations acquire a nuclear capability of their own, to the sound security policies adopted by the U. S. under the "New Look".

b. It solves the credibility problem for most nations by, in effect, giving those directly threatened a finger on the strategic trigger.

c. It precludes any need to attempt to match each level of local threat with an equivalent local or U. S. mobile capability at the expense of the U. S. general war and space efforts, or at great additional cost.

d. It recognizes the fact that the peoples of Europe are not likely to fight a third major war on their soil while the U. S. stands by unscathed.

e. It allows the Shield forces to be maintained at a "minimum" essential strength to insure that any aggression warrants strategic retaliation by those Free World entities under attack.

f. It greatly increases deterrence of a Soviet surprise attack as a result of diversifying the political decision mechanisms controlling retaliation and at the same time deploying the Free World's retaliatory forces on a global basis.

g. It will improve the survivability of strategic deterrent forces by exploiting land areas in the Southern Hemisphere for the deployment of some elements.

h. It can be accepted and implemented initially without liberalizing U. S. atomic energy laws since the additional swords are to be built around U. S. boosters but indigenous warheads.

i. Multilateral deterrence would probably be acceptable as a Free World security policy to both the French and British since it aids them in their quest for a unilateral national strategic capability.

j. This concept would give a real role, and increased prestige, to those allies who participated such as Canada, Australia, etc.

4. The concept of a multilateral strategic deterrent system, on a regional or a national scale, does not and need not in any way detract from alliances such as NATO, SEATO, etc. as has been alleged. Today, the alliances, and particularly NATO, concern themselves with a combined

THIS PAGE IS DECLASSIFIED IAW EO 13526

effort to pro-ide an effective Shield, while the Sword that complements the allied Shield is now and will continue to be a national U. S. activity that backs up this allied defense effort. The fact that more than one Sword might be created to back up the combined Shields does not change in any way, the nature, mission, or requirement for these Shields nor need it necessarily detract from them.

5. As other nations acquire a capability to produce nuclear weapons, we can expect that these weapons will be channelled initially into strategic systems, as we ourselves did. The fact that France and England now have this capability, and show no inclination to develop it for their NATO Shield forces, suggests that these new national forces must be integrated on some basis other than within NATO.

6. Now that two other Free World nations possess sources of atomic production, with others soon to follow, the United States no longer has to face the problem of surrendering its warheads, as a prerequisite to adoption of a Free World security concept which accepts the fact that other nations can unilaterally decide to launch strategic nuclear strikes at the USSR proper.

7. Since France and England both are involved with colonial empires, unions, commonwealth organizations, etc., the atomic capability generated within each of these spheres of influence could be deployed in areas other than within the home countries concerned without unacceptable political opposition.

THIS PAGE IS DECLASSIFIED IAW EO 13526

8. Specifically, today and under present strategic deployment plans, the obliteration of the United States proper by a surprise Soviet attack would eliminate almost all of the Free World's strategic retaliatory capability, with the exception of a few Polaris which, even when fully deployed, will account for only about 7% of the total megatons required. On the other hand, if hardened ICBM's were deployed in Central Africa, French island possessions, Australia, New Zealand, and perhaps elsewhere—not as part of the U. S. effort but as elements of a British Commonwealth, Franco-German, or French Union effort—the Soviets would have to attack simultaneously many dispersed areas of the world to deal decisively with the Free World's retaliatory punch.

9. Even if it could be argued that the strategic capabilities which could be maintained by our allies would not individually match the Soviet capability, it seems quite obvious that the USSR could not risk an exchange with any one group of strategic powers while the other two remained untouched on the sidelines free to combine and exploit the results.

10. If the cost factors foreseen for Minuteman are valid, once R&D is retired and the initial U. S. strategic requirements are met, the capital investment in missiles and hardened sites required for a Minuteman Squadron will not exceed by much—if at all—that required for a modern jet fighter squadron, not counting the fighter base. Maintenance and operation costs, once the ICBM squadrons are in place, are negligible in comparison with those of an aircraft unit of similar size, and manpower requirements are also very small by comparison.

11. The fact that areas under British Commonwealth control, and under French Union control are close to Soviet target systems will allow the use of very large high-yield warheads suitable for counterforce targeting. By coordinating the targeting employed in a simultaneous Free World strategic retaliation effort, a fully effective pre-emptive counterforce punch should be easily realized. Likewise, the effectiveness of a second strike counterforce capability would be:

a. Assured if the initial attack was limited to only one of the several strategic powers, and

b. Much improved by virtue of the global deployment of the forces, if the Soviet could ever rationalize and mount a simultaneous attack against the entire Free World effort.

12. By creating regional strategic capabilities within the zones of influence of the United States, United Kingdom and France, we would be building these around the three existing or potential sources of nuclear weapons production. This means that the principal U. S. contribution could be limited to delivery vehicle development and production assistance, and the knotty problem of surrendering control of atomic warheads to our allies would not arise initially--although assistance along these lines to other allies might later prove desirable.

13. If we could group the various swords under regional direction--e.g., Franco-German, Western Union, etc.--other Free World countries could associate themselves in due course with a regional entity whose geographical interests were equally jeopardized. Since in this area a threat against one is credible as a threat against all, response would be assured.

14. Additional political ties between the Shield forces of NATO and SEATO and the three strategic Swords would further guarantee a combined effort under any circumstances and at any place where the Shield proved inadequate.

15. Major Free World countries can afford to buy their strategic boosters from U. S. production just as easily and more cheaply than they now buy aircraft. In addition, the more advanced countries could take the U. S. technical knowhow under our Mutual Weapons Development programs and build boosters within their own areas under license. The example set by Germany in its contract to build F-104's to European specifications and sell them to NATO and other countries could easily be repeated in the case of Minuteman. France could make a similar arrangement with Boeing to produce a simplified and scaled-down form of Minuteman that could subsequently be bought outside the dollar area by other countries willing to participate in regional strategic efforts.

16. Unless the U. S. supports the inevitable trend towards the acquisition of national strategic atomic capabilities, and seeks to channel these into regional control arrangements and coordinated target planning, we are going to find that these national forces will emerge without our aid. The allied attitude, which will grow out of reticence to help them achieve their goals, will destroy the solidarity of NATO and ultimately SEATO. Concurrently our refusal to accept multilateral deterrence will lead to attempts to pour money and resources into an abortive attempt to build up local defense capabilities by building up theater forces.

THIS PAGE IS DECLASSIFIED IAW EO 13526

17. Where a country possesses nuclear warheads of its own, or will soon possess them, and has aircraft for their delivery, even if only on a one-way basis, that country has a unilateral strategic capability. This being true, it is irrational to pursue a policy designed to prevent such a country from achieving their own nuclear capability by being difficult about providing assistance to improve delivery vehicles. Nothing is accomplished by such a policy except to make it more difficult for allied nations to do well that which they can and will do anyhow.

SUMMARY

18. Of the various security concept currently proposed to solve the Nth Country and credibility problems, the concept of multilateral deterrence appears the most realistic, acceptable, and easiest to achieve. It perpetrates with modification a proven deterrent system and will do most for allied solidarity by supporting allied aspirations instead of frustrating them.

19. The alternative to finding a solution which relies on strategic forces for deterrence and/or defeat of general or major limited acts of Soviet aggression is to build local forces to do this effectively along the entire periphery of the USSR. Such an effort would drain resources from our national survival capability and space activities without achieving the desired result due to the cost, if not lack of will, to fight major local wars in the future.

20. Pending other solutions, multilateral deterrence is recommended as the basic philosophy for Free World defense in the 1960-1970 era.

AN AMERICAN TRAGEDY: THE ORGANIZATION
OF OUR NATIONAL MILITARY EFFORT

THIS PAGE IS DECLASSIFIED IAW EO 13526

AN AMERICAN TRAGEDY
THE ORGANIZATION OF OUR NATIONAL MILITARY EFFORT

Since the end of World War II a great number of Americans have viewed with increasing alarm the growing number of acid and vindictive debates which seem to characterize many of the major inter-service relationships in the Pentagon and which in recent years have been on the increase. These debates and controversies have in large part their roots in the national defense organization which continues to recognize the land, sea, and air media as the fundamental criteria by which military tasks are performed. This problem in turn has been compounded in its complexity by the exploding technological revolution in weaponry. It may be sad, but it is true, that missiles, space vehicles, thermo-nuclear energy, and other modern weapon developments do not recognize the traditional lines of separation between the Army, Navy, Marines and Air Force.

Twenty years ago, our country could tolerate separate military services, separately funded and separately quartered in Washington, prepared to fight separate and different types of war in different media, and joined only loosely by the President himself. For until the Joint Chiefs of Staff arrangement was created in 1942, there was no formal organizational arrangement (other than for a few boards and committees) to bring the Armed Services together below the office of the Nation's Chief Executive. The disaster of Pearl Harbor gave mute evidence of that intolerable condition as the Congressional investigation of that catastrophe proved.

Today, however, we no longer can afford to tolerate divisive forces among the Services in the Pentagon. We must develop and maintain a truly national military capability responsive only to national military tasks. Anything less is totally unacceptable. This is especially true in face of the total challenge which the Communists offer the Free World in almost every aspect of man's livelihood from his basic freedom itself, through his economic, scientific and political achievements, to the military forces he maintains to protect himself.

Separate types of warfare fought by separate military services are gone forever. President Eisenhower has stated thisxon several occasions. In fact, this was one of his principal arguments in support of the 1958 Defense Reorganization Act. Yet, notwithstanding the 1958 legislative reforms, the organization of the national defense structure still acknowledges separate types of warfare to be fought by separate military services. Today, all of the military services have an equal voice in the formulation of national military policy (irrespective of their individual contributions to any particular national military task) since their senior military officers have co-equal status in the Joint Chiefs of Staff/Joint Staff system. This committee-type organization has become a type of debating society in which consensus is obtained only through compromise and negotiation. That is, compromise and negotiation by representatives of separate services which

advocate separate types of security policies. One of the basic questions which should be thoroughly investigated by the Congress and the next President is whether or not programs and policies developed through compromise are necessarily the best national military programs and policies obtainable?

Are they the kinds of national military plans and policies which our country needs to meet the variety of Communist military threats which face us and our Free World allies? America's confidence in her military forces is not reassured, but rather is deeply troubled by the growing record of contradictory statements of our senior military leaders. Over the last few years, military testimony before Congressional committees and before the public has been filled with charges and countercharges on the adequacy of our military strength.

Essentially what we have done is to create an organizational scheme in the Department of Defense which emphasizes service responsibilities over national responsibilities and which holds our senior military officers more accountable for their individual elements (Army, Navy, Marine Corps, and Air Force) of the total national military capability than for that total capability itself. Whose fault is this? It certainly is not that of our professional military officers, but rather is a product of historical trends and organizational forms which were created initially to meet the military requirements of the 18th, 19th, and early 20th Centuries. Because the systems, procedures, and organizations were satisfactory in the past, it is no reason to expect that they are adequate and sufficient for the "missile" and "space" eras we are now entering.

This national tragedy can only be eliminated by a vigorous, forward-looking President supported by a Congress determined to destroy those ultraconservative and reactionary forces which are dedicated to perpetuate yesterday's way of doing our national military business. Yes, yesterday's way of doing business in today's new and changing world. No wonder, charges of waste, inefficiency, and inadequacies have been levied time and again over the last few years against the Defense Department by many senior Senators and Representatives.

It is not a problem which can be solved by our loyal military officer corps. It is beyond their charters -- way beyond -- although, or course, their advice must be solicited.

This is a national problem, a national tragedy, a national disgrace. It requires solution by political leaders of vision and dedication, be they Republicans or Democrats. It requires in this one area the application of that type of American frontier spirit which to date has made our country the greatest guardian of freedom in the world. We can never affort to lose this heritage. However, it is perhaps past the time when it should have been brought to bear on the organizational problems of our national defense establishment.

THIS PAGE IS DECLASSIFIED IAW EO 13526

The literature on the organizational issues of the Defense structure is now fairly large and has been expanded greatly in recent years by a number of Congressional hearings and speeches. In this Congress, some five separate bills calling for various degrees of defense reorganization have been introduced by Senator Cooper, Senator Symington, and others. Other Congressmen, such as Senator Engle and Representative Laird, have made long speeches on the need for improving our defense establishment. Representative Mahon and Senators Douglas and McCormack have for years been concerned over certain procedures of the Military Departments. This is but a partial listing of many Congressional voices which have been heard.

Furthermore, an increasing number of newspaper and magazine reporters and editors have commented on the inadequacy of the existing defense organization. Private study groups, such as the Rockefeller Brothers Fund and many university centers, have issued long and thoughtful reports on the necessity for changing our defense structure so that our country can more effectively meet the requirements and threats of this troubled modern world.

Lastly, of course, if we should dismiss these sources on the grounds that their spokesmen either are politically motivated or lack that close association and experience from which to judge the defense organizational issue, we cannot ignore the almost unanimous criticisms of the national defense structure by such knowledgeable and distinguished retired officers, as General Gavin, General Vandenberg, General Ridgway, General McNarney, General Spaatz, and, most recently, General Taylor. All of these dedicated officers reached the pinnicle of military success only to find themselves so frustrated that their post-retirement writings are filled with constructive criticism.

Unfortunately, these military and civilian critics of our defense plans and organization do not agree on the basic causes of the trouble nor upon the remedies. What is pointedly clear, however, is that something serious is wrong with our national defense organization and corrective action is needed. Where there is so much smoke -- so much concern -- there must be fire!

The majority of the criticisms leveled at national defense can be grouped under one or more of three major headings:

- First, are criticisms of our national security policies and how these are originated, developed, approved, and implemented;

- Second, are criticisms of our national defense organizations with particular reference to the respective roles of military and civilian officials, and to the ability of the military to respond effectively to any and all possible threats; and

THIS PAGE IS DECLASSIFIED IAW EO 13526

- Third, are criticisms of waste, duplication of effort, managerial inefficiency and other matters relating to the expenditure of taxpayers' dollars.

On National Security Policy and Its Formulation

One of the basic issues in an analysis of the formulation of national security policy (as Senator Jackson's Committee is developing) is not so much whether or not existing policies are adequate, but rather whether or not the principal "operating factors" -- to borrow a phrase from the Russians -- and procedures for their development are sound. It appears that they need change.

Our national security policies must undergo continuous change to meet the requirements of changing international circumstances. It seems neither useful nor particularly beneficial to analyze the current policies of the National Security Council on a one-time basis. What we can do, however, is to investigate the organization, methods and procedures from which these policies flow to determine if they produce optimum recommendations in the national interest.

Since World War II, the United States unquestionably has become the "leader" of the Free World's forces. Many of our most controversial post-World War II domestic problems, including the public's acceptance of the necessity for an unprecedented peacetime defense effort, have arisen from the process of this adjustment. Yet this adjustment is not yet complete; much remains to be accomplished.

Also in the post-World War II era, the emergence of the "cold war" has made it more and more necessary for the United States to consider its over-all military posture in direct relation to its major domestic and international programs. The 1946-1948 impassioned debates over universal military training and the peacetime draft forewarned of the danger of attempting to separate the military element from the formulation of other major national policies. Similarly, as the "technological" revolution has unfolded, still another major stimulus has been added to the necessity of considering military policy as inseparable from other national programs. The geometric increase in the cost of modern weapons clearly underscores the close relationship between our military posture and the federal budget. Recently, the relationship of overseas military expenditures to the growing imbalance in our international payments accounts has re-emphasized the impact military matters can have on other major national questions.

As the United States gradually accepts an international order marked by protracted international conflict and unparalleled developments in technology, we must never lose sight of the fact that national military policy may directly affect other national programs for scientific development and economic growth. Major fluctuations in defense expenditures can make millionaires in one industry while simultaneously bankrupting manufactures in another.

THIS PAGE IS DECLASSIFIED IAW EO 13526

Thus, the relationship of military affairs to our broader national security policies and to other major national programs is often one of a delicate balance. We, therefore, have the right to inquire as to how military judgements are developed in today's defense organization. Herein we find evidence of weakness and the need for change.

Most of the military recommendations which condition national security policy are compromises among the Services. Often, however, not even military compromises are achievable and our politically appointed defense officials must then submit "military" judgements.

In providing strategic plans and direction to the Armed Services, and military inputs to national security policy, the Joint Chiefs of Staff/Joint Staff present their draft plans and programs to the individual military departments for comment, review and concurrence. The normal result of this procedure is that approved "joint" plans represent the lowest common denominator upon which all the Services can agree. Sometimes, under current procedures, a lowest common denominator cannot be found and a paper is "split" three or four ways.

Under the above circumstances, compromised "joint" positions are not necessarily the best national strategic plans obtainable. In the contemporary "cold war" era, with its concurrent "technological revolution," there exists the strong possibility that many optimum strategies would require major change in the present organization of the Services, and, particularly, in the assignment of military roles and missions.

The absence of a modus vivendi by which Service differences may be easily resolved in the JCS forum apparently has led upon occasion to decisions based on the record of past JCS agreements and actions and not necessarily on the merits of contemporary issues. Past agreements seem to take on an unnatural permanency, or importance. In military matters where objectivity and decisiveness are all important, "juridical precedence" may result in overly cautious programs which may not be adequate to the requirements of modern situations.

As long as Service influence remains dominant in formulating "joint" plans and policies, agreed strategic plans may reject desirable changes in the status quo if one military department is inordinately affected. At the national defense level, the senior military staff must be able to prepare national strategic plans, unhampered by past precedents and by the tumultous administrative and coordinative responsibilities which seem to have submerged much of the time and effort of the Joint Staff. Senior military planners should consider the views of the separate Services, but cannot be limited by them.

Strategic planning must represent something more than a series of compromised positions of the military services. If a "joint" planning

THIS PAGE IS DECLASSIFIED IAW EO 13526

staff merely creates another administrative battlefield on which inter-service differences are waged and aired, it cannot perform its national tasks.

General Taylor, in his recent book, criticizes our national security policies and its machinery as "The Uncertain Trumpet." It seems that the existing JCS organization contributes "uncertain notes" which, when further disrupted by foreign, economic and political compromises at the Presidential level produce the discordant sounds of "The Uncertain Trumpet."

It appears that we cannot hope to obtain the bold, clear, positive military judgments we need in this day and age with a Joint Chiefs of Staff/Joint Staff type organization. Unanimous agreement among the Services on all military matters is not only an anachronism (as is also the need for "distinctive" land, sea, and air expertize in the missile age), but it produces the "uncertain trumpet" that so aptly describes our defense posture today.

An initial goal, therefore, should be to change the Joint Chiefs of Staff/Joint Staff system, and the Service structures, so that we will be assured of the development of clear, bold, military judgments that rest only on national military considerations.

On National Defense Organization

Many of our major national security policy problems stem from the organizational arrangement of the Joint Chiefs of staff structure. There are at least two other major national military problems which emerge from this organizational weaknesses:

- The incompatibility of a "joint" direction over the Armed Forces with the realities of modern emergencies, and

- The excessive and increasing intrusion of civilian direction into purely military matters.

Although Mr. Eberstadt, in testifying on previous organization legislation, has eloquently insisted that "unified" command should be limited to the field or to "functional" levels of military activity, the realities of modern war do not substantiate his thesis any longer. If the U. S. is to enjoy a "ready" and responsive defense establishment, and one immediately transferable from an effective peacetime activity to an equally effective wartime activity, we must somehow provide for single military direction over operational matters at the top. We do not have this today.

There is increasing recognition that national military policy, and the organization which supports it, must be flexible and responsive to a variety of conflicting national demands. Modern weaponry and the complexity of strategic threat requires that the peacetime military establishment be so organized that rapid and intelligent decisions may be rendered on a multitude of domestic and international issues which have major military implications.

Approved strategic concepts indicate that the initial phases of future wars will be critical, be they limited or general wars. There will be no time for lengthy conferences and compromises on the various combatant measures to be taken as were possible during World War II and Korea. The organization of the defense establishment must permit the dispatch and implementation of combat orders within a few minutes. Success will depend on the U. S. ability to mount one powerful, integrated effort in a coordinated manner from the onset of hostilities. The peacetime military organization must be capable of meeting its wartime obligation without organizational change in the event of sudden, unexpected military conflict.

In meeting the requirements of approved national military strategy, the peacetime military establishment must also support other national objectives. There is much evidence to suggest that the present "co-equality" of the military departments in the over-all direction of the national military effort does not satisfy these requirements. To the extent that such an allegation is true, this fundamental objective is not achieved.

Existing divisions of responsibility among the military Services result in many areas of combined military operations requiring lengthy discussion, coordination, and committee consideration before decisive action may be taken. When this is the case within a major combat functional area, such as theater airpower (which in some overseas theater commands is distributed among two and even, at times, among three of the Services), decisive action is so difficult to obtain that it may affect the outcome of combat operations. The same is true of our "limited" war forces which in some theaters are controlled by two or three different subordinate commands.

Likewise, similar concern may be evident in the air defense structure wherein the combat employment plan requires all Service elements to act as one force. Any delay in decision, or, alternately, any lack of coordination, may result in national fatality.

In past wars in which the U. S. has been involved, the authority of committing military forces in battle was delegated to field or sea commanders. As long as the allocation of resources to the commitment areas was properly controlled and coordinated, the conduct of the military operations in those areas did not require excessive or instantaneous coordination with operations in other areas. In World War II General Eisenhower could commit Allied Forces in Europe without constant coordination with Admiral Nimitz or General MacArthur in the Pacific.

Since the U. S. was not under attack, the central source of military power was not threatened. During the time necessary to move forces and weapons to combat areas, ample time was available for the coordination and discussion of over-all military operations. The final outcome of combat operations was not jeopardized. In future wars, this certainly will not be the case.

THIS PAGE IS DECLASSIFIED IAW EO 13526

The global ranges of delivery systems provided by airpower, the ICBM, and other new weapon developments require significant change in the control of war. Similarly, the same is true of our limited war forces in small war conditions. In future military actions, the military power of the Free World will be projected from multiple points around the world against one focal point -- our Communist adversaries. Under these new conditions, the power of mobilizing our military forces will be fused with the authority to commit our combat forces in battle.

As a result, the defense organization cannot permit division of authority among separate Services if such a division may result in wartime decisions being delayed by debate, coordination, discussion, or compromise. Adequate coordination of nuclear or limited war efforts can only be achieved if they are directed by one "unified" organization, the command of which must be established and tested before hostilities commence. Again, we find a clear need for a single source of military direction, which is not leadership by "committee."

A second basic concern over our existing defense structure lies in the increasing role of Department of Defense civil servants and political officials in "military" decision-making. This has been an inevitable product of "joint", or committee-type military leadership and the existence of three equal, though relatively antonomous Services. The nation requires single military judgments, not three or four military voices. In other words, the existing organization invites -- in fact, encourages -- civilian intrusion into essentially military matters. Someone has to make a decision!

At the top of this ussued lies the accusations of General Taylor to the effect that "political" policy has been extended in the administration and direction of the JCS. At the bottom of this issue we find that many loyal and competent civil servants have gradually been promoted into more and more key positions in the Office of the Secretary of Defense and in the Services. Since these civilian personnel stay in the same jobs, and in the same areas, while their military staff counterparts are obliged by law and custom to rotate frequently, there is little wonder that these civil servants accumulate tremendous influence and authority. They are becoming the experts. This problem demands solution.

An effective national defense organization must assure professional military decision on essential military matters. This does not challenge the principle of civilian control. It reinforces it. However, we must guard against the possiblity that vital military decisions (under the guise of civilian control or efficiency measures) are unduly influenced by political or economic criteria or by officials with no military background or military responsibility.

THIS PAGE IS DECLASSIFIED IAW EO 13526

The necessity for providing civilian checks, balances, and limited power over the national military organization is essential in a democracy for many reasons, not the least of which is that the peacetime military establishment is an organized power concentration equipped and trained to commit violence.

In achieving effective civilian control, complex administrative procedures which prevent the effective commitment of our military forces, if ever necessary, must be avoided. This objective is hard to obtain, particularly in light of the short tenure of office of top defense officials. Yet, the national military establishment must remain under effective civilian control. It must create an environment in which its officer corps respects civil authority. It must be responsive to both the Chief Executive and to the Congress.

It seems to me that one cure for excessive civilian intrusion in operational military matters lies in reorganizing the JCS into some form of single directing agency.

As long as we have a hydraheaded military structure there will be both a need for civilian referees to settle disagreements on military matters, and an opportunity for civilian staffs to control, under guise of coordinating, many activities in the support and research field.

On Waste and Duplication in Defense

In addition to criticisms of defense policies and defense organization as such, we hear a great deal about waste and duplication in the defense structure. Many improvements in procurement procedures have been made. Yet, serious misallocations of some types of funds still occur as the findings of the General Accounting Office and Seantor Douglas have revealed.

The real "savings" in the Defense Department, however, will require adjustments in roles and missions as well as integration of activities under single control and direction.

If we are to deal effectively with the real duplication and waste in defense we must create an organization in which the various elements are collectively balanced. We can no longer afford the luxury of having all the Services compete for the privilege of rescuing our Vice President in Venezuela, nor of all Services seeking to develop a major role in space.

Today, the Army is spending taxpayers' dollars to give wings to senior officers and train new pilots, while the Air Force has an extensive program to reduce its pilot personnel. This is a classic illustration of the type of waste which stems from the maintenance of separate personnel structures and policies by the Services.

Although the Navy is developing the Polaris system as one more national strategic system, it apparently is not planning to reduce any of its other forces, such as its carrier fleet, which has the same missions as will be assigned to the Polaris system when it is operationally ready. To read the public information literature of the Marine Corps and the Army leads one to conclude that we have not one but two principal limited war forces.

Even though MATS (the Military Air Transport Service) was created as a single airlift force in 1948 for all the Services, the Navy and Marine Corps have built large air transport fleets of their own and the Army is now embarking on a similar program. Various types of tactical aviation is now flown by the Navy, Marines, Air Force, and Army.

Each of the Services has its own basic flying school, bases, and system. Each has its own research and development structure. The personnel policies for the various officer corps are quite different.

It is in areas such as these that real "savings" and the elimination of waste and duplication can be achieved.

It seems that we should prohibit specifically the expenditure of funds to train specialists in one Service when similarly trained people are in surplus in another. Not only would such action produce economies but it would force the Administration to introduce or present personnel policies which will permit the free flow of officer and men between the Services on the basis of supply and demand in furtherance of the national interest.

The battle for roles and missions is another area where waste and duplication result. It is also a basic factor in the Nation's inability to obtain a truly valid appraisal of competing weapon systems.

Assume for example that the Army or Marines in its innermost councils determines that its development program for a tactical missile is technically or tactically infeasible or unsatisfactory. Should this occur, would the Army or Marines admit it and cease expenditures on the system? The answer is probably no. The natural tendency would be to re-shape the development program, for if such an admission were made when another Service asserted that it possessed a superior weapon, the entire responsibility which goes hand-in-hand with a weapon might be lost. To lose a weapon system then becomes the loss of a major mission and role.

The result of tying hardware to roles and missions is that the Services are inclined to argue for, justify, and seek procurement of those weapon systems which support their particular tasks. This may lead to costly waste and is becoming more and more of a problem with missiles which can be fired in a wide variety of configurations over ranges from 10's to 1000's of miles.

It is the inability to shed, even temporarily, a weapon system or activity due to its importance in preserving the role or mission that goes with it that creates a condition wherein the American people cannot obtain an objective evaluation of competing weapon systems. The present tri-service structure of our national defense nourishes this condition.

Thus, we see that regardless of who is right or wrong the fact that roles and missions -- hence prestige, publicity, and power -- are affected by hardware can lead to either the perpetuation or purchase of unsound or obsolete weapon systems. The same is true in other activities.

With all Services constantly seeking the star role in every emergency situation from police actions to general war, there is little wonder that duplication in development, transport, base requirements, etc., is rampant.

In brief, we are in an era in which the greater part of every Service budget is allocated to aircraft (or the support, thereof), missiles, airmen or missilemen, and development activities. Yet we support an organization of co-equality in future war for land, sea and air forces; an organization that presumes the need for special "expertize" in land, sea and air warfare when the principal weapons of land, sea, and air forces increasingly are distinguished only by the Service labels painted in large letter upon them or by the vehicle from which they are launched.

In the past the principal weapon systems of each Service were clearly associated with the media in which that Service primarily operated. There was no question of the Air Force building capital ships, the land forces building heavy bombers, or the Navy organizing tank battalions. In the fields of the primary Service responsibility, such as land warfare, control of the seas, or air operations, there was little inter-service competition of consequence. As a result, the "ownership" of most major weapon systems prior to, and during World War II, automatically gave the Service concerned somewhat of a "copyright" on the roles and missions that accompanied the weapon systems. In by gond days, the Navy, for example, could cease production of an unsatisfactory vessel without fear of losing a particular Naval mission. Furthermore, there was no serious question of whether or not there should be a Navy. Likewise, the other Services had a relatively free hand in the development of their major weapon systems, uninhibited by the fear that any unilateral actions would prejudice the retention of roles and missions. Today, modern weaponry has changed the game.

As missiles assume the dominant role in strategic firepower delivery, it becomes more and more difficult to identify the missions and dominant weapon systems of the land, naval, and air services if all are to share the principal deterrent mission. If the present trend continues, our national military capability may be endangered. The United States might well find itself in a position of having three competing "strategic" forces to the detriment of satisfying equally as necessary, but less glamorous, military responsibilities. The same problems areis in consideration of other promising development projects such as those in the biological and chemical fields.

Under existing legislation "national" military planning is the responsibility of the Joint Chiefs of Staff. Yet, national military plans, when approved, can only be implemented if the individual Services budget for their respective shares and promulgate them by unilateral policies and programs. As more and more operational functions and missions are surrendered by the Services to the unified commands, a host of subsequent problems of adjustment for the Services emerge.

For example, each of the Services desires a capability to destroy the enemy's major targets. Yet, the dependability of many weapon systems, however, is not the same and frequently another Service's weapon may do the job more effectively, or at least equally as well. In Europe for instance, many enemy targets are now within range of Air Force fighter aircraft, Air Force tactical missiles, Army tactical missiles, Naval carrier aircraft, Naval ship-based missiles, Air Force strategic bombers, Naval Polaris submarines, and Air Force ICBM's. This is an example of where a new weapon system may duplicate the capability of existing weapon systems. It is also an example of where the historic "land, sea, and air" responsibilities may not be in consonance with the capabilities of modern weapons.

Still another troublesome characteristic of modern weaponry is the promise of development of multiple-capacity weapons. Some new weapons combine offensive, defensive, and reconnaissance capabilities. When multiple capacity weapons are added to the defense inventory, questions will arise not only as to which military Service should be assigned principal responsibility for their development but also as to which overseas or U. S. command should be assigned responsibility for their operational employment.

Finally, once a weapon system is assigned to a military Service and that Service associates itself with it by a role or mission, it becomes increasingly difficult to reassign responsibility for the system or cancel its responsibility should a newer, more advanced system be developed. Military roles and missions should be transferable. The national military establishment must be capable of re-assigning and abolishing existing roles and missions and assigning new weapon responsibilities solely on the basis of national military requirements.

The Defense Problem in Perspective

To provide the United States with an effectively organized and administered national defense establishment in these modern times requires substantive change in the existing defense structure. We need singleness of purpose and singleness of dedication among the personnel of the military Services. Anything less might result in a national catastrophe should our military capability be seriously challenged.

The soluation requires political action in our Congress and bold Presidential leadership. Anything less is unacceptable to the American people, for this is a problem our dedicated military officers cannot solve themselves.

ANALYSIS OF DETERRENCE AND RELATED CONCEPTS

Brig Gen. R. C. Richardson
AFXPD-LR

ANALYSIS OF DETERRENCE AND RELATED CONCEPTS

1. What do we mean by a policy of "deterrence" and by such terms as "minimum deterrence"; "mutual deterrence"; and balanced or "stable deterrence"?

2. To what extent should our national objective "to deter war" effect military programs, weapons, policies, and plans?

3. There is a great deal of loose thinking with respect to these questions. This paper will strive to answer them as briefly as possible.

Definition of Deterrence.

4. When a nation, or individual is persuaded not to take a given action by virtue of the fear of the consequences we can say that the factors which led to the decision, when taken collectively, constitute the "deterrent."

5. "Deterrence" when used in connection with National Security refers to all military and non-military factors which, when taken together, will present to any potential aggressor convincing evidence that the costs or risks involved in initiating war outweigh his chances of gain under any circumstance he can create.

Deterrence a Cold War Objective.

6. Measures taken to deter an enemy focus on his decision-making process. Their purpose is to deter him from initiating war. Obviously, therefore, if war occurs the primary deterrent effort has failed. Deterrence of war, therefore, is a Cold War objective and undertaking. As such, it has no valid role in affecting the outcome of war once a war has started, except as it might operate in a secondary and different context to deter the use of some weapon system or the expansion of small wars.

Requirements to "Deter" or "Fight" Can Differ.

7. The forces and measures which might deter the initiation of war are not necessarily those best suited to prosecuting a war. A credible or obvious war winning capability under

THIS PAGE IS DECLASSIFIED IAW EO 13526

any circumstances provides an optimum deterrent to war. On the other hand, it can be argued that war can be deterred by a military posture which does not possess a war winning capability. This is what "minimum deterrence" offers.

8. This is a vital point generally misunderstood. For example, the certainty that war will result in heavy population and economic loss -- say a hundred cities -- is a deterrent. These losses alone, however, can leave the military capability intact and able to win the war. In this case, the deterrent is not absolute since all it does is to place a high price on victory - a price which an enemy might be willing to pay, particularly if he knew that having destroyed these cities we had no further capacity to fight.

9. Again, a small allied strategic atomic capability has great deterrent power against the USSR, but no useful war winning capacity. Here the deterrence stems, not from fear of the military capability per se, but from the fact that its use would likely "trigger" off the U.S. capability under circumstances of our choosing. This is the French concept behind their "A" effort.

10. Deterrent measures focus on enemy intentions, not capabilities. They combine military and non-military actions. On the other hand, war winning requires measures that focus on enemy capabilities and depends almost exclusively on military actions. These basic differences make it possible to maintain a credible deterrent posture without concurrently maintaining an effective capability to win a war should it occur.

<u>The Fallacy of Minimum Deterrence</u>.

11. The advocates of "minimum" deterrence would reduce the U.S. strategic forces to a small, highly protected, retaliatory capability suitable only for "city busting." Their goal is to minimize the cost of the strategic effort, or alternately upgrade the worth of missile systems whose characteristics limit their usefulness to engaging area targets. The concept has three weaknesses:

a. It does <u>not</u> provide a war winning capability. Having used up our missiles in destroying his cities, we remain open to equal or worse destruction by his undamaged military forces.

b. It does <u>not</u> deter limited aggression. The enemy will realize that we would only initiate

THIS PAGE IS DECLASSIFIED IAW EO 13526

an exchange of cities as a "last resort," and never in retaliation for acts that did not directly threaten our survival. Thus, it invites limited war by killing "massive retaliation" -- i.e., strategic response against limited aggression.

c. It is not a rational military strategy in the atomic age. The destruction of cities as a means of defeating an enemy is a vestige of an era in which the key to victory lay in a nation's industrial potential to support the war effort. In atomic war post D-day production contributes little or nothing to the outcome, hence its destruction can only be rationalized as an act of revenge.

On Mutual Deterrence or Stalemate

12. The stalemate thesis holds that when a symmetrical strategic capability exists neither side will use these forces for fear of retaliation. This requires, however, (1) equally adequate weapons; (2) equally adequate ability to deliver; (3) equally effective force survival measures; and (4) equally ineffective active defenses. The fallacy of this thesis lies in the unlikelihood that this symmetry can exist over any period of time in the face of technological progress.

13. Even if the conditions for mutual deterrence prevailed at a given time, the resulting stability in the strategic equation is jeopardized by the very existence of an independent third party capability. The "stalemate" or "mutual" deterrence thesis is only valid in a "Two Party" game, which no longer exists now that the U.K., and soon France, own atomic weapons.

14. The concept of "minimum" deterrence is an outgrowth of the so-called "stalemate" or "mutual" deterrence idea, which as we have seen is in itself fallacious. By combining the arguments that general war will never intentionally occur since both sides will fear retaliation, with the argument that if general war did occur even through accident, the U.S. strategic capability will always be hit first (which assumes an enemy first strike counter force capability) one arrives at "minimum" deterrence as an adequate strategy on the assumption that a counter force capability is useless if the enemy birds have "flown the coop."

THIS PAGE IS DECLASSIFIED IAW EO 13526

On Stable Deterrence.

15. This thesis holds that war by accident is the greatest threat. It assumes the existence and validity of a condition of "mutual deterrence" or "stalemate," and seeks to obtain further economies at the expense of the strategic effort by eliminating readiness to respond as a survival measure. This is little more than a conceptual rationalization to eliminate air alert, airborne dispersal of weapons, automatic response to warning and hence the need for BMEW's, satellite warning systems, etc.

16. Stable deterrence ignores entirely the war-winning requirement and would protect only "minimum" deterrent forces by hardening, ground mobility, or submarine bases with the argument that even our "minimum" deterrent forces should not retaliate until after deliberation, and no force should be maintained so ready to respond as to risk inadvertent reaction.

Deterrence and Military Programs.

17. The primary, and only valid, military objective is and remains readiness to defend the nation successfully in war.

18. The military cannot properly accept force programs or concepts that gamble our survival on our ability to prevent war, - i.e., -deterrence - alone, and that admit defeat, or at minimum, mutual destruction should deterrence fail.

19. Deterrence is a valid national Cold War objective to which the military posture contributes. Deterrence requirements cannot be allowed to govern the military posture, which must always be optimized for the prosecution of war.

20. Military policies, plans, and programs while contributing toward influencing enemy intentions (deterrence) must aim primarily toward coping with enemy military capabilities. This means enemy forces or that which makes them effective.

21. Concepts of "minimum deterrence," "stalemate," "mutual deterrence," "stable deterrence," etc., are little more than rationalizations for reducing the cost of national defense, or elements thereof, by gambling on enemy intentions and the ability to prevent general atomic war at the expense of accepting defeat or annihilation if the gamble fails.

22. We must be careful, henceforth, not to be awed by catch phrases and parrot these in military planning. We don't

build forces for "deterrence" or even "deterrent forces." We build forces for national defense -- to fight. Their deterrent effect is only a peacetime by-product of their war waging capability. Failure to clearly recognize this fact has led too many people to assume deterrent and war winning force postures as synonymous, and then to accept <u>reductions in the war winning capability based on arguments for a lesser requirement in the deterrent capability</u>.

0358

AN ANALYSIS of AFXPD-LR

Introduction - The Free World Scene, Circa 1961

1. It was not until 1947 that the United States finally realized that the post World War II international order would not be one ruled by Great Power agreement.
2. It is important to note that the majority of international negotiations for postwar international control systems, which were initially launched in 1943 (such as the United Nations), were all predicated on the basic presumption of Great Power unanimity on all major international issues in the postwar era.
3. By 1948 it was generally recognized that the real post World War II world would once again be one of sovereign states, all desirous of exerting their independent status in international affairs. This is not to say that the independent countries were not willing to cooperate on certain specific international matters. However, international "cooperation" perhaps is at a polar extremity to the voluntary surrender of sovereignty to supra-international bodies, such as the U.N.
4. The response of the United States (politically, economically, and militarily) to the international order of protracted conflict that emerged after World War II was based on a broad concept of "containment." Containment rested on three major propositions:

   a. Multilateral military alliances (e.g. NATO);
   b. Foreign assistance (military and economic); and
   c. Regionalism (e.g. WEU, GATT, EPU, etc.).

THIS PAGE IS DECLASSIFIED IAW EO 13526

5. The zenith of the "containment concept" was probably reached in 1955 with the signing of the Baghdad Pact and the creation of the Middle East Treaty Organization (CENTO). Quite obviously a "Master Plan" of containing Russia had been developed, which ringed the Sino-Soviet Bloc with a contiguous series of multilateral security alliances and bilateral security pacts. These were backed up by an unprecedented strategic atomic capability retained under unilateral U. S. control. The only signatory to all of these postwar international security arrangements was the United States.

6. It is essential to review momentarily the conditions which were prevalent in the Free World at the inception of some of these security alliances (and the military capability of the Sino-Soviet Bloc at that time) before assessing the adequacy of these arrangements to meet the requisites of the "missile era," or of the 1960's.

7. The establishment of NATO rested on the acknowledgement of 12 Western nations (later increased to 15) that the principal threat to the Western Free World was the possibility of conventional Soviet military encroachment, or subversion, in Europe!

8. The major European nations, which were unstable economically, precariously weak politically and almost impotent militarily, viewed with alarm -- with a personal fear -- the Communist success of 1948 in Czechoslovakia. This same fear was entertained by the American body politic who reacted, beneath the U. S. umbrella of an atomic monopoly, with extensive foreign

assistance programs, military allocations, and regional security pacts.

9. NATO was thus born in a psychological milieu of common fear, intense desire for economic recovery in Europe, and universal reliance within the Atlantic community upon the United States for the strategic buttressing of Western freedom. In other words, notwithstanding a host of administrative difficulties, questions of sovereignty and military inter-dependence, NATO was relatively easy to create, for the nations concerned then had one primary threat in common and survival clearly rested upon the principle of "hang together or hang separately."

10. The creation of SEATO occurred some five years later at a different point on the periphery of the Communist Bloc and for reasons, quite dissimilar in some respects, but remarkedly coincident in others to the establishment of NATO.

11. By 1954, the United States had lost its nuclear monopoly. Soviet capacities in the atomic field, as well as in others, were increasingly evident to the peoples of the developed nations, and in particular, to the newly emergent and under-developed countries of the world. The Communists had been successful in China. Communist aggressions, with varying degrees of success, had occurred in Malaya, Burma, the Philippines, Korea, and the Indo-China States of Laos, Cambodia, Viet-Nam and Viet-Manih. Quite obviously, Soviet interest had found a new geographic target area.

THIS PAGE IS DECLASSIFIED IAW EO 13526

12. In the early 1950's there was some public recognition of the Communist threat in Southeast Asia. However, in the United States, France and England, there was nowhere near the universal fear of Soviet expansion, particularly in Europe, that had existed in the 1947-1949 period. In fact, it can be reasonably asserted that unlike the creation of NATO, the establishment of SEATO was welcomed not by public acclamation, but rather by public apathy.

13. Of all the new countries in Southeast Asia, SEATO attracted the membership of only three -- Pakistan, Thailand and the Philippines. The first two had historic ties with Britain, quite similar to the rather unique relationship which existed between the Philippines and the United States. SEATO is in fact a Western military alliance in Asia, made up primarily of the U. K., the U. S., France, Australia and New Zealand. The obligatory provisions of its basic charter are far less demanding upon its members than the comparable provisions of the North Atlantic Treaty.

14. Still another element of U. S. "containment policy" in the post World War II period has been the establishment of four bilateral security pacts in Asia. The international conditions prevalent at the establishment of each of these pacts were similar to the conditions which prevailed at the establishment of the NATO and SEATO alliances. Basically, these pacts were reactive responses to fears of continued Communist success in Asia.

15. The United States-Philippines Pact was signed at the time of the Philippines' independence and obligated the United States to the guarantee of Philippine independence which at that time was seriously being challenged by the Huk uprisings in the interior.

16. The United States-China Pact, which was consummated after Communist successes on the Mainland, declared that Mao Tse-tung's phenomenal success would be stopped short of seizing Taiwan and a few other island complexes.

17. The United States-Japanese Treaty was coincident with the promulgation of a Japanese peace treaty with the Free World Allies. It, too, told the Communists that Japan had fallen under the shadow of American military hegemony.

18. The United States-Korean Pact substantiated by formal international agreement the public declarations of President Truman occasioned by the North Korean invasion of that small postwar state.

19. The international security demands of the 1950's were met with the policy of "containment." The threats, international conditions, and attitudes of various peoples were conducive to the promulgation of such a strategic concept, backed up almost solely by the unilateral strategic retaliatory capability of the United States.

20. Few, if any, of the conditions which existed in the 1950's will exist in the 1960's other than ever persistent fear -- indeed, if now awesome respect -- of the Sino-Soviet Bloc's

THIS PAGE IS DECLASSIFIED IAW EO 13526

ever increasing capabilities. The threats of the '60's may be summarized as follows:

a. A condition of nuclear plenty in both the United States and the U.S.S.R.;

b. Nth country atomic developments;

c. Soviet and U. S. space, missile and technological advances;

d. Soviet Bloc economic, political and social developments (including China);

e. Communist political and economic intransigency in Southeast Asia, the Middle East, Africa and Latin America;

f. Intensified political and economic ferment in the under-developed areas, all of which are characterized by an ever increasing number of newly independent sovereign states.

g. Increased economic and political "independence" in Europe, in Japan and, hopefully, in India.

21. Thus, the principal question -- the fundamental issue -- facing the United States as we enter the "missile era" is: "Is the strategy of "containment," backed by a unilateral U. S. strategic monopoly, of the 1950's sufficient to meet the minimal requirements posed by the threats of the 1960's?"

22. There are many pressures already operative in the world which are eroding the very earth in which the roots of the strategy of the '50's have been growing.

23. First, of course, is the fantastic technological developments in modern weapon systems which greatly reduce -- if not eliminate -- the necessity for maintaining large complex overseas base structures for the strategic weapons. For example, the global ranges of the B-52's (with inflight refueling) and the advent of ICBM's all support this trend. In addition, technological developments in some tactical systems have so improved the mobility of our tactical air forces that we need to rely less on the maintenance of pre-D Day deployments than in the early 1950's. The CASF and STRAC units need overseas bases for combat deployment more than for pre-positioning.

24. A second pressure, increasingly evident in Europe and Japan, is the return to what might be loosely called a 19th Century type of xenophobic state system.

25. As the industrialized nations have increased their economic capacities and achieved political stability, they have become increasingly sensitive over the investure of their national military security in the hands of the United States. This problem, of course, has been accentuated by the public declarations of some U. S. leaders that we would not reply to a Soviet aggression with atomic retaliation unless it was directed against us ourselves.

26. In the newly emergent countries there has been an obvious tendency to avoid entangling alliances with both the Western and Soviet nations. To the leaders of many of these countries, commitments to international alliance structures may

seriously impair their attainment of economic progress and political sophistication.

27. Additionally, only the wealthy can afford balanced armaments in today's world. Unsure of the future, caught in the chasm of aspiration, on one hand, and limited capability on the other, pre-commitment to one major power bloc or another is increasingly considered to be nothing more than voluntary destruction in the event one of these two Great Power Blocs becomes dominant in the 20th Century.

28. A third major pressure which has prompted already some withdrawal of U. S. forces from abroad and provoked serious discussion in government of withdrawing considerably more overseas units is that of economics.

29. Rightly or wrongly, the net gold outflow from the United States (which to some national leaders is a danger of calamitous proportions) is about equal to the "out of pocket" expenditures of U. S. troops abroad, or to our net foreign assistance expenditures. To such influential leaders, the reduction in U. S. units stationed abroad, or alternately of U. S. foreign assistance programs, would thus eliminate the net gold flow danger.

30. Another economic pressure, of course, arises from the mandatory adjustment of the military services to the "cost squeeze." The geometric increase in cost of modern weapons, their research and development programs, etc., requires that priorities be assigned to our essential national military

THIS PAGE IS DECLASSIFIED IAW EO 13526

tasks. Politically and fiscally, we as a nation to date have been unwilling to increase Federal budgetary apportionments at the same rate of increase of cost of military hardware.

31. Another factor is the change of emphasis of theater defense versus the general war and space postures.

32. In the past, the NATO defense was all-important. U. S. NATO forces and military aid for our NATO allies could be easily obtained.

33. Today, we are in a period where the focus of national attention has shifted to such questions as U. S. survivability, civil defense, and space. The missile gap has become all-important. At this juncture, the ability to obtain unlimited funds for overseas bases and deployments decreases.

34. We would submit that as space technology improves and additional space developments take place, the focus of public and official attention will shift again, but this time from the "missile gap" to "space." When this occurs, there will be even fewer pressures to obtain money for overseas activities. The "shield" will be left to its own resources. Again, these thoughts are not based on the question of desirability. That really doesn't count. It is really recognition of trends that are now clearly evident.

35. Finally, there is the question of atomic capacity. The principal reasons for U. S. deployments in many overseas theaters has been to provide the atomic offensive punch. We have already observed the Administration's desire to make

THIS PAGE IS DECLASSIFIED IAW EO 13526

available to our allies tactical atomic stockpiles and, ultimately, to give our allies outright control of tactical weapons. If we don't give it to them they will develop it, though this will take longer.

36. When allied forces obtain their own tactical atomic delivery capability, from one source or another, one of the last remaining rationales for maintaining U. S. forces in overseas theaters will disappear. This will leave only the political requirement of having U. S. forces abroad which may be met with token deployments.

37. In brief, the world scene is shifting. Our problem is to accommodate our present concepts to the realities of the new weapons, economic conditions, and political attitudes of the 1960's or the "missile era." We are in a dynamic age, yet, our Free World strategy tends to be rigid and in some cases downright reactionary. Survival dictates that we change these tendencies.

THIS PAGE IS DECLASSIFIED IAW EO 13526

AN ANALYSIS of AFXPD-LR

Introduction - The Free World Scene, Circa 1961

1. It was not until 1947 that the United States finally realized that the post World War II international order would not be one ruled by Great Power agreement.

assistance programs, military allocations, and regional security pacts.

9. NATO was thus born in a psychological milieu of common fear, intense desire for economic recovery in Europe, and universal reliance within the Atlantic community upon the United States for the strategic buttressing of Western freedom. In other words, notwithstanding a host of administrative difficulties, questions of sovereignty and military interdependence, NATO was relatively easy to create, for the nations concerned then had one primary threat in common and survival clearly rested upon the principle of "hang together or hang separately."

10. The creation of SEATO occurred some five years later at a different point on the periphery of the Communist Bloc and for reasons, quite dissimilar in some respects, but remarkedly coincident in others to the establishment of NATO.

11. By 1954, the United States had lost its nuclear monopoly. Soviet capacities in the atomic field, as well as in others, were increasingly evident to the peoples of the developed nations, and in particular, to the newly emergent and underdeveloped countries of the world. The Communists had been successful in China. Communist aggressions, with varying degrees of success, had occurred in Malaya, Burma, the Philippines, Korea, and the Indo-China States of Laos, Cambodia, Viet-Nam and Viet-Manih. Quite obviously, Soviet interest had found a new geographic target area.

THIS PAGE IS DECLASSIFIED IAW EO 13526

12. In the early 1950's there was some public recognition of the Communist threat in Southeast Asia. However, in the United States, France and England, there was nowhere near the universal fear of Soviet expansion, particularly in Europe, that had existed in the 1947-1949 period. In fact, it can be reasonably asserted that unlike the creation of NATO, the establishment of SEATO was welcomed not by public acclamation, but rather by public apathy.

13. Of all the new countries in Southeast Asia, SEATO attracted the membership of only three -- Pakistan, Thailand and the Philippines. The first two had historic ties with Britain, quite similar to the rather unique relationship which existed between the Philippines and the United States. SEATO is in fact a Western military alliance in Asia, made up primarily of the U. K., the U. S., France, Australia and New Zealand. The obligatory provisions of its basic charter are far less demanding upon its members than the comparable provisions of the North Atlantic Treaty.

14. Still another element of U. S. "containment policy" in the post World War II period has been the establishment of four bilateral security pacts in Asia. The international conditions prevalent at the establishment of each of these pacts were similar to the conditions which prevailed at the establishment of the NATO and SEATO alliances. Basically, these pacts were reactive responses to fears of continued Communist success in Asia.

THIS PAGE IS DECLASSIFIED IAW EO 13526

15. The United States-Philippines Pact was signed at the time of the Philippines' independence and obligated the United States to the guarantee of Philippine independence which at that time was seriously being challenged by the Huk uprisings in the interior.

16. The United States-China Pact, which was consummated after Communist successes on the Mainland, declared that Mao Tse-tung's phenomenal success would be stopped short of seizing Taiwan and a few other island complexes.

17. The United States-Japanese Treaty was coincident with the promulgation of a Japanese peace treaty with the Free World Allies. It, too, told the Communists that Japan had fallen under the shadow of American military hegemony.

18. The United States-Korean Pact substantiated by formal international agreement the public declarations of President Truman occasioned by the North Korean invasion of that small postwar state.

19. The international security demands of the 1950's were met with the policy of "containment." The threats, international conditions, and attitudes of various peoples were conducive to the promulgation of such a strategic concept, backed up almost solely by the unilateral strategic retaliatory capability of the United States.

20. Few, if any, of the conditions which existed in the 1950's will exist in the 1960's other than ever persistent fear -- indeed, if now awesome respect -- of the Sino-Soviet Bloc's

THIS PAGE IS DECLASSIFIED IAW EO 13526

ever increasing capabilities. The threats of the '60's may be summarized as follows:

a. A condition of nuclear plenty in both the United States and the U.S.S.R.;

b. Nth country atomic developments;

c. Soviet and U. S. space, missile and technological advances;

d. Soviet Bloc economic, political and social developments (including China);

e. Communist political and economic intransigency in Southeast Asia, the Middle East, Africa and Latin America;

f. Intensified political and economic ferment in the under-developed areas, all of which are characterized by an ever increasing number of newly independent sovereign states.

g. Increased economic and political "independence" in Europe, in Japan and, hopefully, in India.

21. Thus, the principal question -- the fundamental issue -- facing the United States as we enter the "missile era" is: "Is the strategy of "containment," backed by a unilateral U. S. strategic monopoly, of the 1950's sufficient to meet the minimal requirements posed by the threats of the 1960's?"

22. There are many pressures already operative in the world which are eroding the very earth in which the roots of the strategy of the '50's have been growing.

THIS PAGE IS DECLASSIFIED IAW EO 13526

23. First, of course, is the fantastic technological developments in modern weapon systems which greatly reduce -- if not eliminate -- the necessity for maintaining large complex overseas base structures for the strategic weapons. For example, the global ranges of the B-52's (with inflight refueling) and the advent of ICBM's all support this trend. In addition, technological developments in some tactical systems have so improved the mobility of our tactical air forces that we need to rely less on the maintenance of pre-D Day deployments than in the early 1950's. The CASF and STRAC units need overseas bases for combat deployment more than for pre-positioning.

24. A second pressure, increasingly evident in Europe and Japan, is the return to what might be loosely called a 19th Century type of xenophobic state system.

25. As the industrialized nations have increased their economic capacities and achieved political stability, they have become increasingly sensitive over the investure of their national military security in the hands of the United States. This problem, of course, has been accentuated by the public declarations of some U. S. leaders that we would not reply to a Soviet aggression with atomic retaliation unless it was directed against us ourselves.

26. In the newly emergent countries there has been an obvious tendency to avoid entangling alliances with both the Western and Soviet nations. To the leaders of many of these countries, commitments to international alliance structures may

THIS PAGE IS DECLASSIFIED IAW EO 13526

seriously impair their attainment of economic progress and political sophistication.

27. Additionally, only the wealthy can afford balanced armaments in today's world. Unsure of the future, caught in the chasm of aspiration, on one hand, and limited capability on the other, pre-commitment to one major power bloc or another is increasingly considered to be nothing more than voluntary destruction in the event one of these two Great Power Blocs becomes dominant in the 20th Century.

28. A third major pressure which has prompted already some withdrawal of U. S. forces from abroad and provoked serious discussion in government of withdrawing considerably more overseas units is that of economics.

29. Rightly or wrongly, the net gold outflow from the United States (which to some national leaders is a danger of calamitous proportions) is about equal to the "out of pocket" expenditures of U. S. troops abroad, or to our net foreign assistance expenditures. To such influential leaders, the reduction in U. S. units stationed abroad, or alternately of U. S. foreign assistance programs, would thus eliminate the net gold flow danger.

30. Another economic pressure, of course, arises from the mandatory adjustment of the military services to the "cost squeeze." The geometric increase in cost of modern weapons, their research and development programs, etc., requires that priorities be assigned to our essential national military

THIS PAGE IS DECLASSIFIED IAW EO 13526

tasks. Politically and fiscally, we as a nation to date have been unwilling to increase Federal budgetary apportionments at the same rate of increase of cost of military hardware.

31. Another factor is the change of emphasis of theater defense versus the general war and space postures.

32. In the past, the NATO defense was all-important. U. S. NATO forces and military aid for our NATO allies could be easily obtained.

33. Today, we are in a period where the focus of national attention has shifted to such questions as U. S. survivability, civil defense, and space. The missile gap has become all-important. At this juncture, the ability to obtain unlimited funds for overseas bases and deployments decreases.

34. We would submit that as space technology improves and additional space developments take place, the focus of public and official attention will shift again, but this time from the "missile gap" to "space." When this occurs, there will be even fewer pressures to obtain money for overseas activities. The "shield" will be left to its own resources. Again, these thoughts are not based on the question of desirability. That really doesn't count. It is really recognition of trends that are now clearly evident.

35. Finally, there is the question of atomic capacity. The principal reasons for U. S. deployments in many overseas theaters has been to provide the atomic offensive punch. We have already observed the Administration's desire to make

THIS PAGE IS DECLASSIFIED IAW EO 13526

available to our allies tactical atomic stockpiles and, ultimately, to give our allies outright control of tactical weapons. If we don't give it to them they will develop it, though this will take longer.

36. When allied forces obtain their own tactical atomic delivery capability, from one source or another, one of the last remaining rationales for maintaining U. S. forces in overseas theaters will disappear. This will leave only the political requirement of having U. S. forces abroad which may be met with token deployments.

37. In brief, the world scene is shifting. Our problem is to accommodate our present concepts to the realities of the new weapons, economic conditions, and political attitudes of the 1960's or the "missile era." We are in a dynamic age, yet, our Free World strategy tends to be rigid and in some cases downright reactionary. Survival dictates that we change these tendencies.

Col R. C. Richardson

OUTLINE OF BRIEFING ON AFOS PAPERS

I. Present Situation

1. In the Air Staff DCS/P&P is responsible for generating the initial long-range guidance and objective force programs on which USAF plans, programs, research efforts, and force requirements are based.

2. In the past this was done by:

a. Publishing a yearly overall estimate, FSPO.

b. Expanding on FSPO in the WPL.

c. Including in FSPO the objective forces.

3. In 1958, Plans took a new approach to the development of objective forces. This in turn led to a revision of the type and scope of conceptual and strategic guidance on which the force requirements were to be based.

4. In brief, the past system of developing an estimate of the situation and forces - and costing and processing these in one effort - was too long and cumberson for the rate of change in technology, security policy, international alignments, etc. By the time we processed and delivered FSPO a year or more had gone by and much was obsolete.

5. What we needed was a cellular system in which those elements of the Estimate and Concept that remained valid could be recorded once and for all, eliminating the need to agree on new wording to say the same thing each year. We then needed a system where changes could be made quickly in the component parts as the need occurred without re-processing the whole.

6. In addition, the objective force had to blend considerations of desired objectives with realistic facts of past and current programs, commitments and cost. The long-range concepts and objectives used as a point of departure could, on the other hand, take the form of pure requirements or desired goals.

THIS PAGE IS UNCALSSIFIED

7. Since our objectives are largely unadulterated requirements, while the force run-out is requirements largely tempered by capabilities the two do not necessarily track in all respects. This led us to separate, though closely coordinated, efforts - with the forces, based - to the extent practical- on the objectives.

8. Now, let us consider why we need long-range Air Force objectives in the first place.

II. Why We Need an Objective Series

9. The need for long-range objectives seems obvious on the face of it, but there are some who feel that useful and adequately disseminated long-range objectives tend to establish a so-called "party line" and as such, are undesirable.

10. While this may be true to a certain extent, we consider that the valid need for objectives far exceeds the risk in this respect, particularly nowadays when the cost and multiplicity of roles and programs, coupled with the long lead times involved (10 years) requires that the Air Force commit itself to weapon systems years in advance.

11. In addition, inter-service competitiin for roles and funds seems, unfortunately, to be decided in many cases, by the mount of concentrated pressures, and public opinion, that is generated as a result of well-disseminated objectives. (See Navy of 1970 Era)

12. A recent analysis of some 522 typewritten pages of speeches given by senior officers of the Air Force, on Armed Forces Day 1959, indicated that there was little coordinated effort to explain to the public the Air Force position and Air Force views on these matters that are of foremost importance to us at present.

13. Two things were apparent from this analysis. First, relatively inadequate attention is being given to various subjects on which the Air Force is currently interested in putting across its views and objectives For example, the role of the Air Force in space; our desire to obtain greater unification; our views opposing the position of other services on the importance of limited war; and the questions of airlift, survival after atomic attack, and budget.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

14. Second, the views expressed on these matters, when they were discussed were not wholly consistent and often failed to exploit some of the strongest arguments available since these arguments were not collected in any accessible document.

15. This analysis confirmed our feeling that we have not been taking adequate steps to provide within the Air Force an explanation of the views and positions that we in the Air Staff have adopted on basic issues and that we desire to have explained to the American public at each and every opportunity. Our "in-house" guidance on these matters was inadequate.

16. We need only look at the progress of the Army's well publicized objectives - "to establish the priority for limited war requirements on a par with those of the strategic deterrent", - to appreciate what can be done by concerted action.

17. In the past the Air Force did not compete unduly for its roles and missions with others but only for recognition of the importance of airpower. Now, the recognized importance of airpower not only insures adequate funding and public support for reasonable requirements, but leads others to seek airpower roles.

18. In addition, many claim that the new threat is now in economic, political and small war spheres where the dominant role of airpower is far less clear.

19. In the resulting environment of conflict, and doubts as to our defense requirements, plus the prospect of tight defense budgets, the maintenance of a proper role for the Air Force will require not only careful planning, but also concerted effort to achieve our objectives. This in turn calls for our establishing sound long-range objectives.

20. To illustrate the Air Force need for objectives, in comparison with that of other services, we once asked some 20 colonels to answer the following question: "If you had unlimited choice over the roles, functions, and activities of the Air Force what changes would you seek by 1965." There was no consistency whatsoever in the answers we received. The majority could not suggest any substantive changes or objectives as clearly desirable. This suggests that our party line is a status quo.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

21. Now I think we would all agree that a similar question among Army officers would elicit immediate answers asking for "control of continental air defense"; "control of all land-to-land missiles (strategic or otherwise)", on the theory that they were an extension of artillery;"control of tactical air and of airlift for STRAC"; as well as "the dominant role in space." Likewise, the majority of Naval officers know that they are to seek a strategic deterrent role on the basis of the Polaris.

22. We feel strongly that a negative objective policy, based on the theory of retaining what we now have, will not prevail in the future. We must work towards objectives compatible with the facts of technological, political, and economic change if we are to preserve the dominant role of the Air Forces in defense.

III. The New AFOS System

23. In order to meet this new requirement, Plans and Programs established, in January 1958, the Air Force Objective Series. This Series replaces the FSPO and is designed around two simple principles or "gimmicks".

a. Dealing with new ideas, major changes, and substantive objectives on an item-by-item basis.

__. Overall estimates cannot focus attention on vital changes, explain the reasons for the changes, and get general approval where so many factors are involved.

__. Knowledge is not equally advanced in all areas.

__. It is hard to reflect economic, political and service considerations in overall estimates.

__. New issues, and basic policies should first be agreed separately, then introduced in overall studies.

b. Presenting approved long-range guidance and objectives on a distinctive format.

__. We need a bibliography of basic USAF objectives and views on matters affecting forces, force programs, roles, etc.

__. Key officers need a small, up-to-date reference file on the USAF objectives if they are to work in a coordinated manner to achieve these.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

__. We need a place where one can look up the reasoning behind certain changes or AF positions in day-to-day papers. An understanding of why we have a certain view is vital to its further analysis and application. This is lacking at present.

__. We need a system that will allow selective distribution of USAF objectives, some even unclassified. Their achievement requires a broader base of effort than one can permit in overall studies such as FSPO and WPL.

24. This new system substitutes a series of separate papers, we call AFOS, for the previous Long-Range Concept of Operation and Strategic Appraisal in the FSPO papers. There is really nothing very radical about this system. It was felt, however, that it would have the following advantages over the previous custom of including our Objective Force Structure under one yearly "appraisal of the situation".

a. Permits timely guidance on new issues.

b. Allows for diversified distribution and classification.

c. Allows an explanation of the reasons for the objective.

d. Provides permanence and continuity - no annual revisions, where not required.

e. Easier and quicker to process and read.

25. Although the AFOS series is designed to replace the guidance provided in FSPO, there is a vast difference in the type of objective guidance we propose to incorporate in our new series, and that in previous appraisals.

IV. Scope of Objective Papers

26. Our goal is to define the best U. S. national defense structure in any future era, and then state the Air Force role therein, taking into account not only military factors but also realistic allowances for the political, economic, and inter-service situation forecast.

THIS PAGE IS UNCALSSIFIED

27. The purpose of the series is to:

a. Establish, and record, a USAF conceptual philosophy.

b. Concentrate efforts towards selected USAF goals.

c. Provide quickly guidance for desirable changes.

d. Establish a sound point of departure for our Long-Range Objective Forces studies.

28. Our initial objective papers cover four general fields:

a. Policy Objectives. (To get the climate we want)

b. Conceptual Views. (To agree on the nature of war)

c. Force Programs, Roles and Mission Objectives (To indicate USAF roles and the types and nature of the forces required)

d. Miscellaneous Objectives (To achieve limited aims)

Policy Objectives

29. We have an agreed policy. Should it be an objective? We are trying to review the substantive and agreed USAF policies that now exist throughout the Air Staff, and to re-state certain of these as long-range objectives.

30. Policy objectives are important for two reasons:

a. They lend continuity to our efforts and provide a certain amount of guidance for Air Force friends, and others, who would like to know what they should work towards, butfrequently have had to be satisfied with today's views on a subject rather than an agreed goal.

b. Our ultimate job, Force Program Objectives will, of necessity, depend upon the existence of a certain climate to be assumed. The validity of our assumptions here will be greatly enhanced if we have the objective of making the assumptions come true.

31. There is a little bit of the chicken and the egg in this approach. However, I think we all appreciate the fact that once we have agreed upon a program for the Air Force, we obviously want to bring it about. One way to do so is to insure that the assumptions on which it is based are validated by pursuing these as policy objectives.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

Conceptual Objectives

32. These deal with new military concepts and ideas. This is not doctrine. It involves taking issues which now appear in plans or public writings and dealing with them analytically once and for all. This will seek to standardize and disseminate the Air Force view on such matters as:

a. Duration of initial atomic exchange.

b. Nature of limited war and general war.

c. Need for conventional versus atomic capabilities.

d. Quantity versus quality in atomic war, etc.

33. For long-range material and budget planning purposes we must have an agreed idea of the types of wars to prepare for and how they will be fought if we are to narrow the alternative force possibilities to within manageable proportions.

34. Our conceptual objectives seek to introduce the so-called new ideas that people have been clamoring for.

35. One of the weaknesses apparent in a great deal of today's planning and activities is the fact that the great amount of change in new weapons, new techniques, new technical possibilities has not been accompanied by an adequate adjustment of doctrine, tactics, concepts and the fundamental principles of war. (Elaborate here)

Force Programs, Roles and Mission Objectives

36. These constitute our effort to translate the first two areas into guidance, on the USAF roles in defense in future periods and the nature of forces needed to discharge them.

37. Here we deal with separate tasks, and/or functions initially and avoid specific figures, since these appear in the objective force effort.

Miscellaneous Objectives

38. These are objectives which may appear expedient from time to time to be included in the series. These relate to correcting false public impressions, to service policies, and to interim objectives which are deemed to be necessary as a first step toward achieving an approved objective. This

is a catch-all that we are keeping for such occasions as may arise.

IV. Command Distribution & Status

39. In June, after testing the new system within the Air Staff for a year, the Vice Chief approved distribution of AFOS series papers to major commands. You will receive them shortly.

40. The initial distribution will be in a looseleaf binder, designed to be built up as new papers are issued (sample). The delay in getting these out has been due mainly to the well-known problems of reproduction and processing.

41. Now what do we expect from you?

42. While the objectives we send you bear the approval of the Chief of Staff, and represent our best effort within the Air Staff, our information is not always complete. In addition, we are not able to invariably outguess you - the customer - with respect to the areas or topics on which you feel you need authoritative guidance.

43. Bearing in mind that:

a. Processing an AFOS takes from 4 to 10 months.

b. The series must be kept small and focus only on issues of interest to top levels if it is to serve its purpose and

c. We have not as yet scheduled a revision cycle.

__. We solicit in our letter of transmittal any comments you may have for consideration in future revisions, AND additional areas where you feel guidance would be desirable or useful.

6 Conceptual Considerations for Effective Long Range Military Planning

SOME CONCEPTUAL CONSIDERATIONS FOR EFFECTIVE LONG RANGE MILITARY PLANNING

TODAY'S PROBLEM

Of the many problems which face the military establishment, full adjustment to changing technology and to changing weapon-capability is perhaps one of the most difficult. This adjustment, moreover, is made increasingly complex by the equally dramatic impact of the combined political and economic pressures on total government revenue. These pressures limit the resources likely to be made available to maintain and improve our national military posture. Under these conditions, the growing inability of the military to satisfy commitments and programs in the face of relatively fixed resources and concepts becomes the major problem that must be realistically faced and assessed by the long range planner.

Now as never before we are in an era in which the adjustment of military programs to limited military resources has become an element in the daily life of every national military planner and commander. How successful we in the professional military have been in making this adjustment is open to serious question. One thing seems clear, however. If we are to continue in the future to adequately defend the free world, then the military, the "body politic", and our elected officials, will have to analyze very carefully the long range ramifications of today's dynamic national security environment. Adjustments will have to be made, and made successfully; there is no alternative if we are to survive.

Based on today's strategic considerations, it is imperative that long range military planners recognize that their projections must evaluate not only military technology, but also the political, economic, and governmental environment in which future concepts, strategies and forces will be developed.

ANALYSIS OF THE PROBLEM

1. POLITICAL/ECONOMIC CONSIDERATIONS. Resource allocation to non-military programs as well as to military programs are dependent upon governmental revenue.

To arrive at some general parameters of the level of funds available for Defense, the long range military planner must first look at projection trends in GNP, Federal governmental revenues, and non-military expenditures.

The major political/economic factors determining the extent of military outlays can be summarized as follows. (Referencing the attached chart).

First, the Gross National Product.

The projection is based on a three percent growth factor. This factor is based on historical data and, at the same time, is one which would certainly be feasible without inflation. (See attached chart). Specifically, the figures are these:

GNP PROJECTION

Act 1957	Act 1958	Act 1959	Act 1960	Est 1961	Est 1962	Projected 1968
$432B	$435B	$454B	$480B	$507B	$522B	$624B

0395

Second. Working from the GNP projection, one can derive an estimated total Federal Revenue for use as a planning factor. (Note the second line on chart).

Using the estimates prepared by the Treasury for the 1960 Budget, the assumption is made that personal income tax revenues will grow by 4.5% a year which corresponds to an income elasticity of 1.4. Corporate income taxes are projected at 3.0% a year, reflecting an income elasticity of 1.0. Excise taxes grow at 2.5%, resulting in an income elasticity of about 0.8. Other revenues are projected at 1.5%. These projections are based on a study made by the Committee for Economic Development headed by Otto Eckstein.

FEDERAL REVENUE PROJECTION

Act 1957	Act 1958	Act 1959	Act 1960	Est 1961	Est 1962	Projected 1968
$71.0B	$69.1B	$68.0B	$76.8B	$81.3B	$84.3B	$105B

Third. "The 1962 Federal Budget in Brief" summarizes the political/economic pressures which are brought to bear on the total revenue. Listed below, as well as plotted on the attached chart, are data for 1957-1961-1962. In addition, there is a projected figure for 1970. This figure was arrived at from an analysis of the individual requirements for the various non-military programs. The basis and rationale of these projections will be discussed in more detail in future briefs. They have been derived from information available on the trends in each specific area considered. A note of caution is added. Not all programs are assumed to increase. The projections here are intended to be net - not increases in all programs within the group shown below. (All figures are stated in billions of dollars)

		1957	1961	1962	1970
	a. International Affairs and Finance.	$1.9	$2.3	$2.7	$4.5
*	b. Commerce, Housing, and Space Technology.	$1.45	$3.78	$3.37	$6.0
*	c. Agriculture.	$4.5	$4.9	$5.1	$6.0
*	d. Natural Resources.	$1.297	$1.951	$2.138	$3.0
*	e. Labor and Welfare.	$3.0	$4.5	$4.8	$7.0
*	f. Veterans Administration.	$4.7	$5.2	$5.3	$7.0
	g. Interest on Debt.	$7.3	$9.0	$8.6	$9.0
*	h. General Government.	$1.790	$1.982	$2.071	$2.5
	i. Military Assistance (include in Int'l Affairs on chart)	$2.3	$1.7	$1.750	$3.0
	j. Atomic Energy/Stockpiling.	$1.9	$4.3	$2.7	$5.0

* These are shown on the chart under Domestic Affairs.

0396

2. OVERHEAD COSTS. The increased sophistication and performance of new systems has also been marked by a great increase in the costs per unit or weapon. Thus, concurrently with the political and economic pressures, we must also consider the increased costs of R&D, Personnel, and Defense Systems, all affecting the extent of our "ability to deliver", the final factor in our analysis.

Turning first to R&D outlays (see chart), one of the major elements in the rising costs of hardware has been the "revolution" in the research, development, and test performance areas. The over-all R&D effort has, in fact, been a major national undertaking. AEC R&D expenditures for instance have risen from $275 million in 1954 to over $825 million in 1960. Total government expenditures for R&D have risen in a similar fashion, now reaching more than $6 billion annually.

Production costs for almost every new weapon system have increased due to the increased complexity of high performance aircraft/missiles. The cost of the aircraft transparency of the F-80, F-86, B-47 types runs in the neighborhood of $5 per square foot, but the B-58/X-15 type windshield costs approximately 30 times that. The cost of operating and maintaining new systems has also increased. It costs $500 per hour to fly a B-47. But the modern B-52 costs $1300 per hour to fly. This trend in the operations and modification costs of defense has also been encountered in Defense Department communications and electronics systems. The cost of current bombers is 1.5 to 2 times that of their immediate predecessor. The cost of next generation bombers will be double that of the current bombers, or 3 to 4 times those of 1950. In the missile field, research and development have reached a multi-billion dollar figure, and the re-equipping of all types of forces with missiles will be even more expensive.

Since the end of the Korean War, military manpower strengths have been steadily reduced. However, the PERSONNEL COSTS of maintaining a force of 2.3 million men in 1960 are about the same as the Korean period personnel expenditures. Concurrently, the average wages of the "blue collar" civilian employees of the Defense Department have steadily increased, even though the total number of such employees has also been reduced.

The retired pay of military personnel is now less than $1 billion annually. However, within a few years when the retirement rolls are increased by the men who entered the Armed Forces in World War II, it is estimated that our annual retirement costs will exceed $4 billion. Likewise, the costs of maintaining bases and supplying other types of support have increased steadily.

3. MILITARY COMMITMENT PRESSURES. In addition to all these other problems and pressures, our peacetime military commitments have increased. We are now obligated to support a number of multi-national security arrangements, such as NATO, CENTO, SEATO, OAS, and ANZUS, as well as a number of bi-lateral security pacts, such as those with Canada, Japan, Korea, and Taiwan.

If we consider the evolution of military hardware and the concomitant increase in costs against relatively fixed dollar ceilings, it becomes obvious that the quantity of forces has to be reduced. This is what we in military planning call the "Defense Squeeze."

When it occurs, the pressures for more and more money grow more intense within and without the defense establishment, with competing claimants representing almost every functional area and conceptual group.

4. ABILITY TO ABSORB ATTACK. Furthermore, the nature of the changing strategic threat to the United States has resulted in more and more funding allocations whose purpose is the ABILITY TO ABSORB ATTACK. (See chart). This has required us to emphasize "hardening" to increase survivability. (e.g. SAGE Centers and ICBM sites). The airborne alert and base dispersal programs are based on the need to retain a retaliatory capacity should we be attacked. Many support items are being stockpiled. Much of the expansion of funds in the electronics-communications area has been based on the necessity for assuring communications should an attack be made against the U.S.

5. ABILITY TO DELIVER ATTACK. Continuing our analysis, it is important to consider what has happened to the costs of the weapon systems which compose our ABILITY TO DELIVER ATTACK. In USAF fighter aircraft, we have watched the inventory change from F-80's at $100,000 each, through F-84's at $300,000, through F-100's at $750,000, to F-105's at twice the cost of the F-100. The atomic submarine costs 20 times its World War II prototype for just the vehicle - not including its POLARIS missiles. The aircraft carrier since Korea has risen from approximately $100 million (excluding the costs of crews, aircraft, and munitions). The increasing cost of missiles further squeezes the "Ability to Deliver Attack."

As a result, strategic plans have been modified and the number of active units has been decreased. To be sure, much of this quantitative decrease has been compensated for by an increase in capability, but there is some question as to whether the compensation has been sufficient.

6. INFLATIONARY PRESSURES. (Reference price increase triangle on chart). Since the Korean War, the monies allocated to defense have tended to remain in the neighborhood of 40 millions of dollars. At the end of the Korean War we were allocating approximately 12 per cent of the GNP to defense expenditures; by 1958, this allocation had fallen to 9.0 per cent.

In other words, the percentage of the Gross National Product allocated to defense has tended to decrease over the last few years. The real impact upon defense activities has been magnified further by the concurrent inflationary trend which has resulted in the defense establishment receiving successive allocations of dollars with less purchasing power.

7. DEFENSE LINE. (Reference the wide dotted line on chart). As we assess the future, it appears that any sizeable increase in defense expenditures would require a reappraisal of U.S. economic and political views on tax rates, the size of the national debt, and other considerations. Although some increase in the future can be expected, short of war, it seems highly unrealistic to assume that over-all defense expenditures will be greatly increased, especially to the extent necessary to cope with rising costs of new weapons and other defense factors.

On the assumption that over-all defense expenditures were keyed to a constant percentage share of the GNP, more defense programs naturally could be funded. However, it is doubtful if such a change would really satisfy the majority of the claimants. To be sure, some of the more difficult funding decisions could be postponed, but it appears that within several years they would have to be made. (Note the hatched triangle on chart).

0398

8. <u>NORMAL ADJUSTMENT TO THE PROBLEM</u>. Looking at normal adjustments to the problem, we can say that there are several courses of action.

a. Better planning, programming, budgeting in House.
b. Request more money.
c. Eliminate "waste" and "duplication."
d. Reduce stockpiles,"non-essential" programs, etc.
e. Stretch out procurement.
f. Cut research, development and test evaluation (RDT&E).
g. Re-evaluate "uncommitted" forces.
h. Finally accept major changes in concepts and/or commitments.

Better Planning, Programming, and Budgeting must be accomplished by military planners. Heavy emphasis must be placed on these factors and better techniques and procedures developed. Internal improvements along these lines can result in substantial dollar savings, and these improvements must be made. (Because of the importance of this alternative, it will be considered more fully in a separate paper.) Requesting more money is just not the answer because of the three way pressure of overhead costs, political and economic requirements, coupled with the inflationary spiral. A real increase must come from changes in concepts and a growth in productivity to insure greater revenue for both non-defense and defense expenditures. Elimination of waste and duplication is a continuing process, and certainly is one that will contribute materially to a solution of the problem. The reduction of stockpiles and non-essential programs is complicated by differences in the views of the Services as to the proper size of the mobilization base. Do we have a 30-day supply or a 120-day supply? To what degree will we depend on conventional or non-nuclear weapons? These problems must be dealt with before this course would be effective. We have stretched out procurement, but the recovery of dollars becomes very small. Cutting RDT&E, for example F-108's, is like selling your insurance to keep the Cadillac going. In the long run, you really suffer. Re-evaluation of uncommitted forces such as Air/Sea Rescue, ships on the DEW Line, contribute very little. In the final analysis, the solution seems inevitably to lie in changing concepts and/or commitments.

DEFENDING AGAINST THE ICBM

General Discussion

1. With the USSR and the United States both building large long-range missile forces, the nation that first perfects an effective defense against these weapons will achieve a significant military advantage.

2. The ability to destroy enemy-launched ICBMs as far as possible from the United States has become a defense requirement of the utmost national urgency.

3. ARPA is conducting studies and evaluations of several promising anti-missile systems, including some which would make a kill shortly after launch. Extraordinary effort is warranted to accelerate the attainment of an initial operational capability with this kind of system.

AICBM Only a Part of Task

4. Warning and tracking are basic elements of an active defense system. We cannot defend against an ICBM if we cannot find it and follow it. Thus, an equally-high priority accompanying requirement is the need for an early operational capability to track missiles and satellites and to tie this to surveillance for rapid data exchange.

The Danger of Fear

5. While pressing for these capabilities, we must be careful that fear of Soviet ICBMs does not force us into unreasoning acceptance of an expensive AICBM proposal simply because it might be made available sooner than other proposals. If accepted, such a system could sponge up all available defense funds and stop or limit needed research and development of new weapons. The test must be: will it do the job?

THIS PAGE IS DECLASSIFIED IAW EO 13526

Desired Features of an AICBM

6. Two philosophies of air defense are opposed in the approach to an AICBM. One is the point defense system, the other is area defense. An analysis of the differing views is useful to decision in this vital area.

7. The advocates of area defense state that ICBM defense must begin as far as possible from the United States, not directly overhead. Their case rests on four logical and easy-to-grasp arguments:

a. Cost. Area defense protects all included points. Point defense raises the obvious questions: do we defend cities or do we defend strategic strike forces? Costs would be prohibitive of defending all, so which of these do we defend?

b. Difficulty. Area defense seeks to attack an ICBM at its most vulnerable point--the launch phase when it is attached to its large, flame-belching booster, when it is traveling at its slowest, and when the mildest kind of blow can deflect it from its course or destroy it. Point defense, on the other hand, arbitrarily abandons the easiest approach to defense and selects the most difficult--the re-entry phase when it is a small, hard warhead traveling straight down at high speed.

c. Damage to Defended Area. Area defense strives to keep blast and radiation damage out of the defended area. Point defense, attacking a nuclear warhead with a nuclear warhead, raises the damage level in the defended area.

d. Susceptibility to Counter-measures. A number of relatively simple counter-measures are available to sophisticate the ICBM warhead or to make defense against it more difficult. These include such things as decoy warheads, increased speeds, and variable trajectories. All of these measures are available for the re-entry phase; few are available during launch.

Which Direction ICBM Defense?

8. A tested and proved, low-cost point defense AICBM system is useful to overall defense of the United States.

0605

THIS PAGE IS DECLASSIFIED IAW EO 13526

It can best be employed to defend a few selected high-priority targets against a small number of ICBMs.

9. Logic seems to indicate, however, that the most promising defense against the intercontinental missile is an area defense system that will give us useful kill ratios at an economic tradeoff. This means that it should cost us less to knock down enemy ICBMs with this system than it costs him to offset our defense. The United States should press toward this kind of capability as a matter of the highest national priority.

ARTICLE ON "COUNTER-FORCE".

THIS PAGE IS DECLASSIFIED IAW EO 13526

NOT A POSITION PAPER - TALKING PAPER ONLY

AFXPD-LR
1 December 1960

ON COUNTERFORCE

1. Two theories of war pervade thinking on national security affairs today. They are incompatible and thus form the basis for major differences of opinion on which direction our military posture should take. An understanding of these differences is essential to an understanding of military affairs today.

1st Theory -- A Return to Small Wars

2. One theory holds that neither the United States nor the U.S.S.R. will begin an all-out nuclear war because neither side can win. Both commit suicide.

3. Beginning from this premise, the case is then made for creating larger limited war forces. The reasoning goes: while general war is too horrible to contemplate and will therefore not happen, limited wars automically become more likely. For now the U.S.S.R. will realize that it can nibble away at the edges of the Free World under the umbrella of mutual deterrence of the big nuclear war.

4. To meet this threat, this theory holds, we build large limited war forces -- big enough to handle a Korea or even another World War II -- and pay for them out of money saved from cutting down on strategic war systems.

5. This can be done because the United States no longer need prepare to win a general war; it need prepare only to deter it. And an effective deterrent force, the argument continues, can be achieved by possessing the ability to destroy a hundred or more Russian cities. This calls for a much smaller strategic capability ("minimum or finite deterrence") than the United States now has, and funds for limited war forces could come from the surfeit of funds that would thus become available.

2d Theory -- Counterforce

6. The second school of thought, adhered to by the Air Force among others, rejects the minimum deterrence concept. It believes such a deterrent would not be credible to the Russians, since in event of Soviet large-scale aggression against, say, a major ally, the United States would be unwilling

THIS PAGE IS DECLASSIFIED IAW EO 13526

to devastate Moscow [illegible] the price were to have New York or Chicago (or both) destroyed in return. Finite deterrence would put the United States in this position by providing military strength sufficient only to hurt an enemy by destroying his cities--while leaving his weapons untouched and largely free to destroy the United States.

[illegible] Supporters of this second view believe that the Sino-Soviet Bloc under[illegible] only one thing: mass force. Consequently, there can be nothing [illegible] about deterrence; instead, the Free World must confront the Soviets [illegible] incontestably superior military power.

[illegible] This second group believes that effective deterrence is achieved only [illegible] the United States has the ability to prevail in general war if such a [illegible] should occur. They believe that power that cannot prevail will not [illegible]. Believing that deterrence is a by-product of a war-winning capability, [illegible] group thinks the United States must be prepared to fight and win a [illegible] war as well as lesser aggressions.

[illegible] te Force Defined

[illegible] To many people, it seems impossible that one side could win a thermo[illegible] war, given the power and destructiveness of modern nuclear weapons. [illegible] there could be situations in which neither side won. There could, however, be situations where one side emerged with a clear-cut victory, [illegible], if its military capabilities far surpassed that of its opponents.

[illegible] Victory in general war is achieved when the enemy's military forces have been destroyed and there remain adequate friendly military, political and [illegible] capabilities to permit the victors to control the international [illegible]. To build such a war-winning capability, the United States must [illegible] to a military strategy aimed at destroying the enemy's military forces [illegible] than his country or population. That is what is meant by "counter[illegible]" or "counter-military" strategy--using military forces to selectively [illegible] destroy enemy military forces that could otherwise destroy us.

[illegible] Needs

[illegible] requirements for a war-winning capability go beyond pure military [illegible], however. In addition to a counter-military strategy, the [illegible] must have aggressive civil defense and post-attack reconsti[illegible] recovery program.

[illegible] civil defense program must provide maximum protection for the population, including evacuation of major population centers in case of an impending attack. The post-attack reconstitution and recovery program must

THIS PAGE IS DECLASSIFIED IAW EO 13526

provide for the reconstitution of political control and military forces to continue the war and measures to expedite economic recovery. These measures--together with a counterforce strategy--will provide the ability to prevail, and hence to deter.

Counterforce is Traditional

13. In broad historical terms, there is nothing new in the counterforce concept. As a matter of fact, it was a traditional military concept until the 20th Century. The two World Wars, however, added a new ingredient essential to victory--the destruction of the enemy's war-making capabilities.

14. The military technology of that time was such that the decisive phase of war came after two to three years of hostilities, when the production lines began to turn out weapons and equipment for use by massive ground armies. Because of the central importance of war production, certain pivotal industries, e.g., fuel and transportation centers, had to be attacked. Destruction of these facilities destroyed the capability of armies and the will of the people to continue the war effort.

15. Nuclear weapons and aerospace forces have erased the validity of mobilization war concepts in general war. These two instruments of war, joined together, have forced the decision point of war to come at the beginning of hostilities. Consequently, the required war-winning capability must be extracted from the industrial base prior to the initiation of hostilities. The decisive force thus created must concentrate on immediately destroying the fundamental military strengths of the enemy.

The Nature of Access to Targets

16. The most essential element to be destroyed is the enemy's aerospace forces. Once the enemy's aerospace forces have been defeated, access is gained to all other military forces, including other nuclear forces. With this access, the capability to destroy the enemy's remaining forces and otherwise exert pressure on him becomes self-evident and leads to his surrender.

17. In modern warfare there is no longer any requirement to destroy enemy [illegible] is there a need to destroy industries which make no vital contribution after war begins. Under such conditions, striking cities with nuclear [illegible] would signal an irresponsible act of desperation and revenge, calcu[illegible] about the spiteful destruction of civilizations rather than [illegible] victory.

What Counterforce Requires

18. To implement a counterforce strategy demands a well-integrated national military structure. It requires, first of all, strategic offensive forces to

THIS PAGE IS DECLASSIFIED IAW EO 13526

destroy enemy strategic strike forces at their source. Next, strategic defensive forces in depth are needed to destroy enemy strategic weapons in-flight, as far from the United States as possible, but as close-in as necessary. Thirdly, we need military forces to conduct a holding action in conjunction with our allies, to prevent the overrun of friendly territory. And, finally, there must be accurate information on the status and location of the enemy's residual forces which must be destroyed. With these ingredients, the United States will be able to use its military power with discretion in general war just as it plans to do in limited wars.

19. These ingredients must be carefully tailored to their missions. Offensive and defensive weapons must always be in position and ready to strike with precision and accuracy on an instant's notice in all kinds of weather. There is no place in a counterforce strategy for weapons which promise only the inevitable destruction of some few enemy cities. Instead all forces must be geared to destroying all enemy forces that threaten the United States during the decisive early hours of the conflict. In addition to aerospace weapons, the United States must have intelligence capabilities able to locate enemy forces before the outbreak of hostilities so that they may be attacked at the outset of war.

Feasibility of Counterforce

20. The feasibility of a counterforce strategy today varies with the conditions prevailing at the time U. S. forces are launched.

21. If our forces are launched after a surprise attack by the U.S.S.R., their capabilities to carry out counterforce tasks will be handicapped but not eliminated. At the minimum, those forces on airborne alert will be able to strike enemy targets, and U. S. air defense aircraft and missiles will degrade seriously the attacking forces.

22. On the other hand, if U. S. forces are launched in response to an all-out attack on our major allies or on certain knowledge of an impending attack on the United States, their counter-military capabilities will insure U. S. victory.

23. Regardless of the conditions under which hostilities may begin, a counterforce strategy, more than any other, will minimize the enemy's ability to inflict damage on the United States.

Counterforce in the Missile Era

24. In the future this same concept will remain valid. As missiles become the primary strategic weapons of major powers, however, the problems of identifying and striking enemy strategic forces will change. To successfully attack such forces will not be an easy task; and in large part, its difficulty has led to the minimum deterrence concept.

THIS PAGE IS DECLASSIFIED IAW EO 13526

25. Critics argue that since implementation of a counterforce strategy requires destroying all enemy strategic capabilities early in the war, it is not an acceptable strategy when the United States responds to a Soviet attack. In such a situation, they contend, the United States would not know which targets to strike and it would not be militarily sound to hit all missile sites after some missiles have been fired.

[illegible] These difficulties notwithstanding, sound logic demands that the [illegible] States strike all enemy missile sites. Unless its military forces [illegible] to go after these targets, the United States cannot launch a strategic [illegible] against the Sino-Soviet Bloc to come to the aid of an ally. It cannot [illegible] because it cannot hope to win. Even in a situation where the United [illegible] responds to a Soviet attack, the United States must hit missile [illegible]

[illegible] Striking Missile Sites

[illegible] argument most often raised against striking missile sites is [illegible]ly an economic one. It is said it is too "costly" to hit missile [illegible] after some of the missiles may have been launched. This argument, [illegible], does not consider the correct costs. The costs to consider are [illegible] of not striking missile sites which house missiles that could be used [illegible] the United States. In other words, in terms of U. S. survival [illegible], it is much more costly not to strike all known missile sites.

[illegible]. Moreover, if the Soviets attack the United States, not all their [illegible] will be launched on the initial strike. Intent on winning war [illegible] minimizing damage to the U.S.S.R., they will have to concentrate [illegible] on military targets. They will retain a sizeable residual force [illegible] the initial attack to continue to threaten U. S. industrial and urban [illegible], to strike additional lower priority targets or high priority targets [illegible] but not destroyed in the initial attack; to retain a reserve to [illegible] other possible threats from third parties; and to negotiate with or to [illegible]. These missiles will be at their launch sites when the United [illegible] strikes back. In addition, because malfunctions, unready missiles, [illegible] in command and control, and reloading of certain missile sites, [illegible] additional missiles will be in place.

[illegible] these factors might result in as high as 25-30%, or more, of the [illegible] being on site when the United States strikes back. The United [illegible] the means to destroy these targets.

[illegible]

30. In summary, the Air Force recognizes that deterrence is man-made, a [illegible] the United States has created by maintaining superior military

THIS PAGE IS DECLASSIFIED IAW EO 13526

forces in-being. [illegible] recognizable war-winning forces, the Sino-Sov[illegible] that, by threatening to raise the level [illegible] higher scale, it can bend the United States and [illegible] will.

31. For these reasons, [illegible] a counterforce strategy is a fundamental precept of [illegible] of deterrence, and is the most essential ingredient [illegible] capability.

32. Counterforce is feasible, [illegible] of a U.S.S.R. surprise attack on the United States, [illegible] an attack on an ally, or a U. S. response to [illegible] impending attack on the United States.

33. Without [illegible] -military strategy, the United States [illegible] the Free World, it denies itself flexibility [illegible] provocative situations, and it subjects itself to possible [illegible] by the Sino-Soviet Bloc.

34. With counter-military [illegible] States has the means to defeat the enemy's [illegible], to deter general war, or to prevail [illegible]

AFXPD-LR
19 November 1960

ON DOD REORGANIZATION

1. One of the principal points to understand in considering DOD reorganization is that reorganization is a continuing process. As the national defense environment changes, so must the organization and procedures of the national military establishment.

2. Examples of significant changes in the national defense environment over the last few years include:

a. The shift in the "axis of command" from the Secretary of Defense-Service-Combatant Forces to the Secretary of Defense-JCS-Unified Commands.

b. The technological revolution in weaponry.

c. The growing capability of modern weapon systems to accommodate a variety of different functions now assigned to the separate military departments.

d. The rising costs of modern weapons.

e. The passing of separate land, sea, and air warfare.

f. The continuing need to integrate as effectively as possible all elements (military policy, foreign policy, etc.) of national security policy into broad national programs.

3. To meet these new and changing conditions in the national defense environment, the Air Force endorses specific DOD organizational and procedural changes designed to:

a. Secure at the top of the national military organization unity of military direction over all operational and support matters.

b. Obtain a truly national military review of all force and weapon requirements by a national military staff.

c. Eliminate the anomolous responsibilities of the members of the Joint Chiefs of Staff which require them to act as plaintiffs, defendants, jurors, and judges on all major national military issues.

d. Increase the stature, responsibilities and functions of the Joint (or a National Defense) Staff.

e. Develop procedures by which force and weapon requirements are reviewed and adjusted to budgetary ceilings by the national military staff.

f. Place all combatant forces under unified commands.

g. Delimit and clarify the responsibilities and functions of the individual Military Departments.

4. In summary, the Air Force position on defense reorganization:

a. Supports specific measures for change at the top of the national defense organization and "evolutionary" measures at other levels.

b. At this time does not indorse merger of the Armed Forces into what has been called a "single service."

THE ICBM -- HOW MANY? WHEN? WHAT KIND?

General Discussion

1. The value of a weapon changes constantly. In general terms, then, the number you need or even whether you need it at all varies directly with a weapon's usefulness during any particular period.

2. This explains why the program for any weapon has to be reevaluated constantly and why weapon programs have to be readjusted to fit the needs of the new time period. It stands to reason, then, that the more nearly we can forecast the set of conditions that will prevail when the weapon is actually coming into the inventory, the less oonfusion and debate and waste will result from the inevitable readjustments that follow.

3. Forecasting was relatively unimportant when we were dealing with low cost weapons. It is becoming increasingly important as weapon costs rise astronomically. At several millions of dollars apiece, the ICBM is an example.

Soviet Production Overtaking U.S.

4. Some time between 1961 and 1963 Soviet ICBM production will probably overtake U.S. production. The danger in this situation is that, while over-all U.S. strategic strength will remain greater than the USSR's, the increasing Soviet ICBM strength will raise the vulnerability of our manned aircraft not on airborne alert.

5. This danger is aggravated by the fact that during this period we will not have assured warning of a Soviet ICBM attack.

6. In view of these facts, we need a large force of ICBM's as quickly as we can get them.

What Will Be Available and When

7. The Atlas, Titan, and Polaris are the only practical ballistic missiles available during this period. The production of Atlas and Titan has been balanced against the production facilities and the money available. And, although it is not a true ICBM, Polaris can be made available in significant numbers to supplement these ICBM's in this time period.

8. After 1963, Minuteman -- in concrete holes as well as on trains -- will be coming available in large numbers. As Minuteman becomes available, the value and usefulness of the Polaris missile will be markedly affected because of the substantial difference in on-station cost between Minuteman and Polaris.

Polaris' Value Now and in Future

9. Between now and 1963, the U. S. can complete, equip, and send to sea about 15 nuclear Polaris submarines. These will be a welcome addition to the U. S. strategic force for three distinct reasons:

a. They will have a value in supplementing the over-all ICBM strength during a critical period.

b. They will provide diversity to the strategic forces.

c. They will cause the Soviets to spend precious resources to counter this threat.

10. This first value will disappear as Minuteman comes on the scene. This raises serious questions as to the proposed size of Polaris program beyond the time when Minuteman becomes available.

Polaris Compared to Minuteman

11. Cost-effectiveness of a weapon -- the over-all cost versus the over-all effectiveness -- is one of the tests a weapon must pass in order to survive and provide for the national security. While this kind of factor cannot be mathematically precise, cost-effectiveness considers items such as the cost to produce, deploy, and operate a weapon. It looks into percentages of the weapon that will normally be available at any one time, not shut down for maintenance or crew rest. It estimates how well the weapon will survive in action, how reliable it will be, how many an enemy could destroy, and how well it will do its job.

12. Cost-effectiveness studies of Minuteman versus Polaris disclose a ratio of nearly 5 to 1 in favor of Minuteman, a fact which suggests that Minuteman should logically be the preponderant ballistic missile after 1963.

Polaris' Role Post-1963

13. There is no precise formula for deciding how many of a particular weapon we need to get proper diversification of our force. Since diversification of the strategic forces will be the principal purpose of Polaris after 1963, it seems reasonable that the United States should program only enough Polaris missiles to make sure that the Soviet war planners will not be able to ignore this force when considering an attack.

14. Approximately twenty nuclear submarines carrying 320 Polaris missiles seems to be a proper level for this weapon whose principal role now is to help fill a gap and whose principal role later will be to complicate the Soviet's problems.

15. Beyond this level, funds for Polaris would be at the expense of other, better weapon systems -- particularly Minuteman.

THE SHIFTING SCENE IDEA
and
THE IMPACT ON CONCEPTS AND BUDGET PROSPECTS

Some talk today about paying for a return to conventional war as if this were as vital as our general war or space capabilities. The truth of the matter is that as the support for one goes up, the support for the other goes down. This is normally overlooked by most writers. It is what I call the "shifting scene" and can be explained this way.

From 1945 until approximately 1953/54, the only real concern in this country was with the threat to our Allies. Our people did not really believe that anyone was going to bomb Detroit, but they were very much concerned about Communistic aggression in Greece, Korea, Italy, etc. Ninety percent of the writers, military people, diplomats and what-have-you, focused their attention on the overseas defense problem. In this environment we had no trouble in getting five billion aid programs, precedent-setting treaties like NATO, and anything else that would solve the threat to peripheral areas.

From 1953 on, the spotlight moved gradually to a new stage with the realization that the Soviet inter-continental rocket systems posed a real threat to the U. S. proper. At this time a large percentage of the above leaders, and intellectuals, began to write on such subjects as second "strike," civil defense, invulnerable deterrence, Polaris systems, air alert, etc. When this occurred one saw the spectacle of a bi-partisan committee of distinguished Americans - such as the Draper Committee - recommending to Congress an increase in foreign aid, and a Congressional and public response which, in essence, said: "You don't understand the problem. The problem is the missile gaps, strategic survivability, etc. Consider yourself fortunate we don't cut aid even more." This attitude or reception is the product of the change in environment. It had nothing to do with the validity or objectivity of the Draper Committee's arguments. The defense of Allies was no longer the main show.

Likewise, I suggest that in one or two years, give or take two, the environment will change again. The spotlight will shift to a new stage -- that of space. When the Russians put a man on the moon; put a weapon in orbit; or undertake any one of a dozen major possibilities,

we will see the focus of public, military, Congressional and intellectual attention shift to this stage.

When and if this shift occurs, I can visualize myself going before Congress, proving to them we have a dangerous missile gap that jeopardizes our very survivability, asking for funds and being told: "Son, you don't understand the problem. The problem is the lunar base; consider yourself lucky we are not reducing your missile inventory." In this environment if someone comes in asking for a handout for conventional local war forces they will have, in my opinion, about as much prospect of getting it as a snowball in hell.

What I am trying to suggest to you is that there is a tremendous lag between the actual threat and the sale and adoption of concepts to match. These two theories, for example, the need for conventional war capability, and increased MAP were valid and should have been sold and implemented 6 to 8 years ago. The fact that they were valid then was recognized in retrospect. The sales effort then took several years and we now find it progressing in an era in which the requirement no longer makes sense. Likewise, I am sure some people will be selling "invulnerable deterrent" concepts and ICBM's in an era when they ought to be worrying about space technology.

Fortunately, the scene also shifts on the other side. I am sure that Mr. Khrushchev used to get 8 out of 8 briefings on plans to conquer peripheral areas. He now probably gets 7 out of his 8 on schemes to win the world by ICBM or space programs.

In the above environment the one briefer that comes in with a supposedly successful plan to over-run, let us say Italy, on the grounds that the Allies have reduced their local shield forces, U. S. troops have gone home, and our will to defend Italy is doubtful, is probably told: "Don't bother me with problems that threaten to upset the wonderful space schemes I have launched. Communist advance by the local war route and at the rate of one country a year would take 300 years to get to America. I have had briefings all morning that tell me that if I follow the rocket and space routes I can conquer America in 10 years. Therefore, even if we have the advantage against Italy, I don't want it exercized."

The above scenario illustrates the fact that we have to take into account the diversion of resources and interest into the new technological possibilities on the other side. This is why I said at the beginning of this discussion that it is not correct to assume that all past threats remain equal while new ones develop. As interest increases in one direction it, and the resulting threat, decreases in others. Admittedly it is difficult to assess these changes quantitatively, and there are also slippages as between the opponent and the time factor.

USAF BRIEFING ON SPACE

PART I - SPACE AND NATIONAL SECURITY

INTRODUCTION:

Today we would like to explain our views on space, with emphasis on the importance of space systems to our national security in the near future. Additionally, we shall show you our ideas of the space weapon systems that must be developed, what we are doing in the Air Force about these systems, and what our Air Force studies indicate we should be doing in addition if this country is to exploit the potentialities of space in achieving an adequate space posture vis-a-vis that of the USSR.

We will also touch upon the tremendous resources that the Air Force now has devoted to aerospace research and development, in one form or another, and that can be utilized effectively as we shift our emphasis from air and missile toward space activities.

ON MILITARY USE OF SPACE

First of all, there are some who question whether space technology has a valid role in our national security posture at this time. Obviously, any military program in space is conditioned by the views one has on this basic issue.

We in the Air Force have studied the space medium as it may be used in modern war, and we have sought for several years

to establish the relationship between space and national military power. As a result of these studies we are convinced that in the not-too-distant future the space capability is almost certain to become the dominant factor in the determination of national military strength.

Now you may rightfully ask how we arrived at these conclusions, since it is admittedly difficult this early in the game to demonstrate in detail how each and every space vehicle will be used in a war. Such detail is not essential, however, to convince one of the military role that space systems will play in the next 10 to 15 years. Students of defense matters judge the worth of new weapon system proposals on the basis of basic considerations such as historical trends, and how the new capabilities are likely to affect the fundamental principles of war.

If one were to demand detailed justification and an explanation of how every new development will be used as a prerequisite to initiating the development, we would never get anywhere. This would be equivalent to having insisted that the Wright Brothers describe in detail all the military uses of the airplane before we invested in the first one. Yet, as obvious as this example is, there are still those who expect us to set forth all future operational concepts and capabilities, today, before they will support a new weapon system development.

Let us briefly examine some of the evidence on which we base our conclusion that space systems will in due course be the dominant factor in assessing national power.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THE ACCESSIBILITY ARGUMENT

First, and foremost, is the obvious role that space vehicles can play to provide increased access to the enemy, and conversely to deny him access to the vitals of the Free World.

Whenever technology has increased a nation's ability to observe and/or attack its enemy's forces and other vital elements; when the time required to observe or attack has been decreased by increases in speed of military vehicles; and when flexibility of employment has been increased by improved ranges and hence freedom from forward bases, the weapon systems which permitted these improvements have quickly assumed transcending importance in assessing relative national power. Ships, aircraft, ICBM's, and now space vehicles illustrate this progression.

When surface ships provided access to the ports and economies of the world, and when those nations with sea power could move troops freely while denying this freedom of movement to others, national power was measured largely in terms of naval forces. The history of England contains the best examples of that era.

The development of the airplane opened up tremendous new horizons in accessibility. Air power permitted access not only to the sea and enemy shores, but also directly to the hinterland. Control of the air replaced control of the seas as the first prerequisite to victory in war. New concepts were built around the new capability - strategic warfare is an example of

THIS PAGE IS DECLASSIFIED IAW EO 13526

this. And the nation that could mount high performance fighters could deny access to its opponents as was the case in the Battle of Britain. Technical superiority and quality began to replace mass in the composition of decisive forces, as best evidenced in Churchill's famous statement on the role of England's small fighter force when he said: "Never in the field of human conflict has so much been owed by so many to so few."

The advent of the ICBM, with global ranges and short delivery times provided a further increase in accessibility for purposes of deterrence or destruction. This is now reflected in our tendencies to readjust our general war concepts and forces - emphasize 2nd strike, survival measures, civil defense, air alert, etc. Power is now measured more in terms of missile forces - or gaps - then by numbers of aircraft. A few nuclear-equipped missiles can now do the destructive job it took thousands of bombers to do in World War II.

Historically, then, major readjustments have always taken place in force composition, force requirements, and military concepts whenever technology has provided a new and greater means of access. In each such case, time has been compressed, and the nations that controlled access - those that had the means of exploiting access while denying it to others - dominated the world power scene.

THIS PAGE IS DECLASSIFIED IAW EO 13526

Now whatever one may say of space, it is quite clear that as space systems evolve they will provide far greater access than have ships or airplanes. Space systems can provide access, not only to land, sea and air, but also to space and other space systems and space bodies. Time will be compressed further.

Space, therefore, will become the new "high ground" in the military sense. Its worth will become apparent first in the reconnaissance field, as was the case for the airplane, and later in the delivery and air defense field. We will show you shortly some trends in this respect.

ON NEW DISCOVERIES

Even if one questions the importance of space systems as weapon delivery or reconnaissance vehicles, one must appreciate the fact that many major discoveries were made while searching for something else. Columbus was not looking for America. Likewise, the nation that has a decisive lead in space research and that achieves the ability to put instrumented devices and men on other space bodies can be expected to make major discoveries which, if they remained unknown to us, could be brought back to earth and eventually used against us.

The threat in this respect appears so clear that we would certainly be risking the security of the United States if we were to assume that a major Soviet lead in space research and development would not uncover any secrets which could be brought

THIS PAGE IS DECLASSIFIED IAW EO 13526

back to earth and later used against us. This could occur if we do not achieve any such discoveries in the same time frame, so as to exploit them concurrently with our enemies, or, alternatively, develop a guard against them.

ON THE PSYCHOLOGY OF TECHNICAL SUPERIORITY

Lastly, we would like to suggest that the psychological impact of Soviet technological feats in space - such as SPUTNIK and LUNIK - has started to erode the confidence of the free world in United States leadership and military power.

Before the Soviets obtained an intercontinental missile capability our Allies relied fully on our willingness and ability to retaliate in their behalf, and had confidence that we would win if we committed our strategic forces.

When a Soviet long range rocket threat appeared, but before SPUTNIK, there was some doubt evidenced in allied areas as to whether or not the U.S. would be willing to commit its strategic forces on their behalf; but there was no question as to whether or not we would _win_ if we did commit it. In this environment our Allies were still willing to look to us for their security and to seek our leadership.

Since SPUTNIK, however, there is evidence of doubt _not only_ as to our willingness to commit our strategic forces in the defense of allied areas, _but also_ as to whether we would win if we did commit them. If we allow this trend to continue, in the

THIS PAGE IS DECLASSIFIED IAW EO 13526

environment of today's balance of terror, we will eventually lose Allies, as they seek survival or security by neutrality, or are absorbed into the Soviet orbit.

The strength of our Alliances, and the orientation of new or neutral nations towards U.S. leadership may well be determined by their assessment of our relative power position vis-a-vis the USSR over the long term. In any such assessment, demonstrated space capabilities will weigh heavily.

IN SUMMARY

If we are now agreed that there are at least three major arguments in support of space's national security value - (1) Increased Accessibility, (2) the Threat from Unknown Discoveries, and (3) the Impact of Technological Inferiority - we might also note that space systems will provide direct performance advantages in terms of extending the capabilities of current air systems in three ways we can ill afford to ignore: Speed, Altitude, and Endurance.

Space systems will permit speed increases over today's on the order of 10 to 1, unlimited altitude, and almost infinite endurance. These characteristics are those the Allies sought at all costs for our World War II airplanes. It was only by gaining advantage in range, speed, and altitude that we defeated the Luftwaffe and the Japanese Air Forces, gained air superiority, and won the war.

0447

THIS PAGE IS DECLASSIFIED IAW EO 13526

It seems clear, therefore, that failure to exploit the strategic possibilities of space and the improved characteristics of potential space vehicles would be a most risky thing to do. For it is a historical fact that the nation that has military vehicles with greater speed, greater altitude, and greater endurance than its opponents will enjoy a decisive military advantage under almost any concept of warfare.

ON SOLVING MAJOR PROBLEMS

Not only does space technology offer conceptual and military possibilities of paramount importance, but, if properly exploited, it also offers to the U.S. the prospect of solving three of today's major security problems.

INTELLIGENCE POSSIBILITIES

The intelligence imbalance between the US and USSR is well known. The Soviet Union has access by one means or another to practically everything that goes on in America. On the other hand, we have only limited capabilities of penetrating the Iron Curtain. This imbalance is particularly important when it comes to knowing the precise location of strategic missile launching sites.

When intelligence was used only for war planning purposes, or for the assessment of relative military capabilities and the likelihood or effects of new developments, an imbalance in

THIS PAGE IS DECLASSIFIED IAW EO 13526

intelligence effectiveness was not as critical as it is today when intelligence is a vital part of the ability to find and target an enemy's nuclear missile delivery systems.

Failure to right the intelligence imbalance in the ICBM era can mean that the Soviet Union could decisively employ a counter-force strategy against America, whereas we would be unable to respond with an equivalent strategy. Under these circumstances, intelligence becomes of transcending importance to free world survival. The advent of space-based reconnaissance and warning systems offers the possibility of righting somewhat the existing imbalance.

We cannot over-emphasize the advantages to be had from adequate and timely aerophotography and surveillance. The dis-continuance of U-2 type surveillance in recent months has placed an increasing premium on the early availability of SAMOS and follow-on space systems. As an illustration of the type of detail that can be obtained from high altitude photography, this picture shows the _______________ area. You will note that we can see quite clearly such small objects as aircraft parked near runways. This represents a resolution of approxi-mately 20 feet. Now photographic technology promises us, within the next 2 or 3 years, resolutions from space vehicles of as high as 5 feet. This means that one could actually identify an item as small as a bicycle parked in front of a

THIS PAGE IS DECLASSIFIED IAW EO 13526

building. With this sort of aerial surveillance, it would be easy to detect Soviet missile sites, particularly during their construction phase and before they can be completed and camouflaged.

AICBM POSSIBILITIES

One of the great problems of this age is the development of an effective defense against the ballistic missile. As the long range missile capabilities of the USSR and the US approach a symmetrical condition, the development by either side of an effective guard against these would have the net effect of decisively unbalancing strategic general war capabilities. Even a Soviet anti-missile space system that could render only partial returns in terms of effectiveness would be the difference between our being able to retaliate effectively or not. Failure to develop a U.S. capability could invite aggression. Conversely, our possession of an effective anti-ICBM would greatly enhance our capability to deliver a strategic attack and reassure our allies as to our will and ability to defend them.

Here again, space systems offer the most promise. While efforts are going on to develop an effective anti-ICBM for point defense, the tremendous problems posed by overhead interception - exploding the warhead in one's face - and the likelihood of effective penetration aids that will defeat point defense systems,

THIS PAGE IS DECLASSIFIED IAW EO 13526

such as maneuvering warheads, decoys, and electronic countermeasures, make it unlikely that in our time a useful system of this type will be developed. On the other hand, the prospects of destroying an ICBM during the boost phase are particularly attractive.

During the boost phase the ICBM obviously presents only one target. It is a target that can be seen from great distances by infra-red sensors. During this phase, the missile is climbing and has not reached its peak velocity, it also presents a very large radar target as compared to that presented by the warhead after separation, and even marginal damage will render it ineffective. Several proposals have been made by industry to develop an effective anti-ICBM system based on satellite vehicles that can detect and destroy the enemy missile during the boost phase. The prospects here are so attractive we can ill afford to ignore them.

SURVIVAL POSSIBILITIES

Lastly, we have the question of survivability of retaliatory weapon systems. As you know, today we are paying a great deal to obtain survivability from sudden destruction through hardening of ICBM's, air alert measures, and the building of POLARIS submarines. Obviously, the attack of hard ICBM sites would have, at minimum, side effects of some consequence. Additionally, a

THIS PAGE IS DECLASSIFIED IAW EO 13526

technical breakthrough which might allow the detection and sudden destruction of submarines, thus making the POLARIS investment obsolete, cannot be excluded in the 1960's. Both these considerations suggest that air dispersal followed by in-space dispersal of some of our retaliatory forces should be exploited to insure that we will always have a valid capability.

The obvious advantage of space dispersal over air dispersal is the fact that, once the weapons or control centers are in orbit, they have almost unlimited endurance since neither sustaining fuel nor frequent landings will be required, as is now the case with air alert measures.

Additionally, speed and distance factors become almost unlimited. Space thus appears to improve survival possibilities for weapon systems and command posts from numerous points of view.

THE SOVIET THREAT

Now the Air Force believes the above considerations are ample justification for a major space effort whether or not the Soviet is developing a threat in this area. Nevertheless, we would suggest that there is a growing Soviet space threat, and there are some indications that it is oriented toward achieving the power position which space offers to the country which first exploits it effectively.

THIS PAGE IS DECLASSIFIED IAW EO 13526

One can certainly argue that space offers a most attractive route for the Soviets to follow, in their aspiration for world domination. We noted with interest in the newspapers recently that the Soviets have reportedly increased the funds allocated to space research and development. While some would argue that limited or general wars constitute the greater threat, we in the Air Force would like to suggest that as space capabilities improve both of these courses of action become less and less attractive. Why is this the case?

It was quite clear a few years ago that if the Soviet Union desired to use military force to achieve world domination, the only effective use that could be made of such forces was in the conquest of peripheral areas. This was attempted in Greece, Korea, Lebanon and elsewhere. It was the only route opened to military means for the simple reason that the Soviets lacked the inter-continental capability to deal directly with their principal enemy, the United States. Now a simple calculation will show that by the limited war route, and assuming the conquest of one free world nation per year, it would take Russia something over 100 years to reach the U.S.

With the development of an effective ICBM capability in recent years, the Soviet Union can now entertain the prospect of a direct attack against the U.S. This route offers them the advantage of achieving their ultimate goal in a short time. On

THIS PAGE IS DECLASSIFIED IAW EO 13526

the other hand, it entails tremendous risks with regard to the cost to the Soviet Union in terms of what we might do in retaliation.

Considering the time factor by the limited war route, and the high risk and loss factor by the general war route, the Soviet Union could well be studying the possibility of developing a space route to world conquest by seeking through space research a decisive military threat of the type that we held when we had a monopoly on the atomic bomb.

Should such a development occur, they would be in a position to blackmail us out of existence with little or no risk of hot war, or ultimately to apply against us some weapon system so decisive that our retaliatory effort would produce inconsequential results.

The prospects of this are so dire, and the evidence that this course is being researched so clear, that it seems to us in the Air Force that a major effort in space must be made in the free world interest at this time.

ON THE U.S. RESPONSE

Against this background I would like now to discuss our Air Force views with respect to the U.S. response to the Soviet space threat. We are convinced that we cannot objectively consider where we go from here if we are not completely candid with respect to the various problems that we face in achieving

THIS PAGE IS DECLASSIFIED IAW EO 13526

a valid space capability. This chart shows the three factors which we believe most inhibit the effective development of US military space systems.

The first factor is cost. The likely cost of a major U.S. military space program is a matter of grave concern to many people. Obviously, if we are to develop effective space weapon systems, it is going to require a great deal of money. Now this money can be had in one of two ways: (a) As an addition to existing defense spending. This would, of course, cause a major rise in the defense budget and an accompanying rise in the Federal budget, or (b) By eliminating some obsolete or obsolescent forces or weapon systems and concepts.

Unfortunately, with the existing imbalance in land, sea and air activities of the Services, those concepts which might be changed or those weapon systems or forces which might be eliminated in favor of paying for a major space effort would work so to the detriment of the power and prestige of one or more of the separate Services as to be unacceptable in the present environment which presumes relatively co-equal service responsibility and contribution to modern warfare. Our Air Force studies therefore suggest that we cannot pay for space at the expense of other activities until such time as we can devise a national defense organization in which all can participate equitably in that which is to be done on a national interest basis and without division of responsibility in major areas of defense.

THIS PAGE IS DECLASSIFIED IAW EO 13526

When the cost factor is solved, either by the provision of additional funds, or alternately by reorganization and subsequent elimination of obsolete and obsolescent weapon systems, forces, and commitments, we then have to deal with the problem presented by those who would defer our military space developments in the hope that space can be kept for peaceful uses.

Now the Air Force has never been opposed to any principle of disarmament, or to the peaceful use of space or other media. We do oppose, however, unilateral actions which are not part of any valid international agreement or which do not provide for inspection procedures, and which have the net effect of reducing our national power and military position vis-a-vis that of the USSR. In other words, we are gravely concerned that the trend toward maintaining space for peaceful purposes, if pursued on a unilateral US basis, will inhibit the development of effective military systems to such an extent that it could give the USSR a long term advantage should they plan to exploit space as the best means of conquering the world. The Air Force considers, therefore, that while we should pursue the possibilities of an agreement on peaceful use of space, we must not neglect the development of military space systems of all types.

Lastly, we have the problem of the inhibiting characteristic of fragmented responsibility for space research. Now it is not our purpose here to discuss how the military effort in space

THIS PAGE IS DECLASSIFIED IAW EO 13526

should be organized. We do point out, however, that at present NASA has certain responsibilities, the Defense Department has certain responsibilities, and, within Defense, space activities are divided among ARPA and the four services. This sort of a division is bound to have repercussions on the effectiveness of the program since no one single operational media such as aerospace can be effectively exploited by several separate and relatively autonomous agencies without a certain amount of waste, overlap, duplication, friction, and loss of flexibility. We do not propose a solution to this problem at this time. I think we all recognize, however, that it does constitute a problem that has to be solved in due course.

NO TECHNOLOGICAL CONSTRAINTS

Having pointed out the principal inhibiting elements to an acceptable space program I would like to mention one factor which we in the Air Force do not consider a constraint on the development of our space effort. This is technology.

If we examine the history of the development of aircraft, and of airpower as indicated on this chart, we see that the forecast for the use of the airplane back in the days when it first appeared failed miserably to match its actual capabilities. You will also note that the initial employment of the air vehicle was for surveillance purposes only as is the case with

THIS PAGE IS DECLASSIFIED IAW EO 13526

satellites at present. This is perfectly logical in the development of this type of system. Unfortunately, capabilities must usually be demonstrated before they are accepted.

A more dramatic view of what technology can do, however, is indicated on this chart, which shows a comparison of the state-of-the-art of ICBM development when Dr. Von Neuman established the requirements for ATLAS with what we obtained six years later.

In the space of six years, you will note that the ICBM development achieved critical area improvements ranging from 20 to 200 times the capabilities anticipated at the time the program was launched. Now Air Force studies suggest that whereas there are technological problems to be solved before many systems become operational, most of these problems are no more complex and no greater, at least for the immediate future, than were those presented to Dr. Von Neuman when he launched the ICBM project.

With these examples, it should be clear that technology alone cannot be used as an excuse for deferring the positive development of effective military space weapon systems. It is doubtful if the Soviets are unduly concerned about the ability of their technology to develop space systems that will be useful in projecting their political power on earth, and I see no reason why we should be concerned at this time.

Now, gentlemen, I have explained to you why we in the Air Force are convinced from a conceptual point of view that the security of the free world demands an effective space effort.

THIS PAGE IS DECLASSIFIED IAW EO 13526

I have pointed out that failure to follow through on a valid military space program risks our defeat, maybe even without fighting.

I have also pointed out that the prospects of regaining the lead in space are excellent provided we are prepared to face up to the cost, or alternatively to the hard decisions required.

What we would like to do now is to give you a slight feel for what space vehicles and weapon systems will look like in the 1960 to 1975 period, that is, an outline of the operational capabilities that we should seek during this period in our military space program.

(25) Who Manages Peace?

THIS PAGE IS DECLASSIFIED IAW EO 13526

NOT A POSITION PAPER - TALKING PAPER ONLY

AFXPD-LR
1 December 1960

WHO MANAGES PEACE?

General Discussion

1. There is no question that cold war programs, realistic arms control policies, and other peace programs are of vital importance to the United States. However, there are a number of questions concerning how a national effort in these areas might be most effectively organized.

2. One body of opinion believes that the best solution to the problem of obtaining an effective over-all national peace program would be to assign principal responsibility to one of the existing executive departments such as State or Defense.

3. Another group, however, believes that a new executive agency should be created to handle such issues as nuclear test cessation, disarmament, and the like.

The Conflicting Responsibilities Problem

4. Fundamental to the organizational issue of how to monitor and manage national peace programs is the problem posed by the great number of existing executive departments, administrations, and commissions which already have overlapping responsibilities in this field.

The Nuclear Test Example

5. To illustrate: AEC, State, Defense, and NASA all have major programs which deal with various aspects of atomic energy. Any proposal to stop nuclear testing has a direct impact upon their normal responsibilities, plans, programs, and budgets. Thus, any program proposed by another agency which did not consider their points of view would result in inevitable conflict and confusion.

6. In addition, the relationship of nuclear test suspension to the top national security policies transcends the responsibilities of any one governmental agency and, thus, is most properly the responsibility of the senior advisory group to the President--the National Security Council.

The Arms Control Example

7. From another point of view, even though international arms control agreements may be negotiated or discussed in special international conferences, no arms control program can be considered in isolation from basic national security policy. Of all the executive departments whose basic responsibilities would be altered or modified by an arms control program, none is more deeply affected than the Department of Defense. The relationship of arms control measures to our national military capability is a question of the highest national concern and should in no cases be considered without active Department of Defense participation.

The Inter-Relationship of Cold War and Peace Programs

8. There is still another vital relationship that warrants major consideration--the relationship between peace programs and cold war activities. Nuclear test suspensions, arms control measures, space explorations, and other similar programs all have a direct bearing on our national cold war programs. For example, the military assistance program, and the activities of the International Cooperation Administration and of the USIA are all vitally affected by arms control and nuclear test policies.

A Proposed Solution

9. In view of the above considerations, what seems to be needed in the management of broad national peace programs is a system to coordinate and control the multitude of existing agencies already involved in these areas, to direct the individual efforts toward the same national objectives.

10. A coordination system such as the one described cannot be disassociated from the one executive agency of government whose principal responsibilities are inextricably tied to cold war, space programs, nuclear test suspensions, and arms control. That department, of course, is the Department of Defense.

11. It appears that over-all control of such broad national programs can only be achieved at the Presidential level with continuous monitoring by a special Presidential assistant.

WHY ATOMIC WEAPONS WILL BE USED

THIS PAGE IS DECLASSIFIED IAW EO 13526

AFXPD
17 May 1961

TALKING PAPER

ON

WHY ATOMIC WEAPONS WILL BE USED

1. It seems likely, if not inevitable, that atomic weapons will be used in any future wars of consequence. This applies to major limited wars as well as general wars. It certainly applies to any war in which either Soviet or Chicom forces are committed.

2. Since some now argue that there remains a valid choice between using or not using atomic weapons, particularly in major limited wars, it might be useful to examine the feasibility -- as differentiated from the desirability -- of having balanced U.S. land, sea, and air forces fight without atomic weapons in this day and age.

3. The lack of understanding of the impact of technological progress on the prospects of sustaining a conventional conflict has recently led to serious proposals that we should reject the use of nuclear weapons except in general war. While these proposals are argued on the grounds of desirability, they overlook certain practical considerations that need to be kept in mind.

4. Nuclear weapons are a fact of life. Like it or not, we have no control over whether or not the enemy might use these weapons in war. This means, of course, that we have no choice but to prepare our forces to defend against atomic attack in

THIS PAGE IS DECLASSIFIED IAW EO 13526

case of war. The very act of preparing for defense against atomic attack causes us to do three things that, in the doing, close the curtain of atomic inevitability on our plans for any kind of war larger than an incursion, police action, or incident. The Soviets have the same problem. They have undoubtedly solved it in the same manner.

Reposturing the Force

5. Once we accepted in 1953 that the enemy can begin hostilities with atomic weapons, or can introduce them at any time into any level of conflict, then we were forced to change traditional force postures. This means that organizations, tactics, positioning, and the characteristics of weapons themselves were changed to give our forces a reasonable chance to survive an atomic attack in the battlefield. To fail to have done this would have been criminally negligent. Indeed such negligence would invite war by offering the enemy the prospect of quick victory.

6. Survival on the atomic battlefield dictates dispersion, mobility, concealment, and freedom from heavy logistic "tail". These characteristics are the antithesis of the mass, force concentration, and heavy firepower formerly associated with warfare. All these characteristics have been replaced by the atomic weapon.

THIS PAGE IS DECLASSIFIED IAW EO 13526

7. Thus we are faced with a dilemma: Having repostured our forces for atomic warfare, do we any longer have an option to fight conventionally? How do we get mass and heavy fire-power from concealed, mobile, dispersed forces? The answer, of course, is that we cannot, not with non-nuclear weapons.

Quick Response vs. Controlled Use

8. The second by-product of preparing to defend against atomic attack has to do with the conflict between the need to control weapons and the need to be able to respond to attack. The history of the case is that as the enemy atomic threat increased, we were forced to place more weapons in the hands of our troops.

9. The original weapons were kept in stockpiles. Later they were moved to SAC bases for storage. As the time for response shrunk dramatically, we began to position weapons overseas and, finally, we loaded them into aircraft for air-borne alert. Similarly, atomic artillery and Army missile units have little use without their atomic warheads. Carriers and Polaris submarines can hardly be expected to return to port for their atomic bombs, mines, and missiles. And the interceptor pilot cannot ask the aircraft he has identified as hostile to stand by while he returns to base for his weapon.

THIS PAGE IS DECLASSIFIED IAW EO 13526

10. The ability to control the use of atomic weapons in an emergency will obviously vary inversely with the extent to which various echelons physically possess them. Since a successful defense against an enemy atomic attack demands that forces have constantly at hand the means to retaliate in kind, it is obviously idle to speculate that some elements of the forces will not initiate their use. We can expect those whose lives are not in immediate jeopardy to exercise discretion and wait for orders. But we cannot expect those who are in active combat, and whose lives are in immediate danger, to go down in defeat with one hand willingly held behind their backs.

11. It is important that we not fool ourselves with respect to the extent of control we are likely to have over the use of atomic weapons in war. Forces on both sides may very probably find themselves faced with a choice of being defeated or of using all weapons at hand to protect themselves.

The Quantity Factor

12. Delivery systems -- airplanes, guns, missiles, ships, etc. -- reflect the characteristics of the munitions they carry. The relationship between performance, quantity and results cannot be ignored. Therefore, complex delivery systems can only be justified if the firepower they deliver warrants their cost. The greater the destruction we can achieve with

THIS PAGE IS DECLASSIFIED IAW EO 13526

one vehicle or missile, the less vehicles we need, and the more we can spend on performance and sophistication. So we have sought optimum performance for our delivery systems. But we have done so at the expense of quantity and hence of staying power in combat.

13. It is common knowledge that no serious effort was made to develop the ICBM until the scientists could promise a high-yield warhead; the use of multimillion dollar vehicles to deliver a small payload was thought to be impractical. Although this is obvious when applied to ICBMs, it is less obvious, though equally applicable, regarding all modern ships, fighters, bombers, and tactical missiles. The Army's Honest John, for example, at the lower end of the missile spectrum, was designed and justified primarily as an atomic delivery system. And, while modern tactical aircraft still have a capability to deliver hard bombs, no effort has been made to develop and pay for today's fighters in quantities needed for sustained conventional combat.

14. Thus we are faced with the third dilemma posed by preparing for defense against atomic attack: increased reliance on ready forces and improved performance for atomic warfare have been at the expense of quantity. Here again a compromise seems impossible. Lacking quantity -- either in hand, in storage, or readily obtainable by emergency production, sustained conventional operations do not appear practical in the future.

THIS PAGE IS DECLASSIFIED IAW EO 13526

SUMMARY

15. Unless the three dilemmas posed in this paper can be resolved, we risk wasting money on attempts to do the impossible, attempts we may try simply because they seem desirable. The result could easily be a compromise military capability -- inadequate to wage conventional war, easily defeated in atomic war.

16. It seems obvious from the foregoing that the choice lies not between fighting with atomic or conventional weapons. The choice lies between fighting with atomic weapons or not fighting at all.

(37) Why the B-70?

WHY THE B-70?

General Discussion

1. The growing obsolescence of our manned bomber force and the significant increases being made in Soviet air defenses dictate a requirement to modernize.

2. The Mach 3 B-70 best fills this vital requirement for a manned follow-on to the B-52.

3. The B-70 is the only aircraft system now under development by the Air Force. Its introduction into the strategic bomber force is essential to the continued effectiveness of the manned bomber force.

The Mixed Force Argument

4. An effective offensive strategic capability requires a flexible force using manned aircraft and missiles.

5. Properly employed, manned aircraft and missiles can complement each other by attacking those targets for which they are individually best suited. Both are needed. Neither can replace the other. The ratio of bombers to missiles may decrease but we cannot abandon the manned bomber.

6. In addition, a diversified attack forces the enemy to dilute his defenses to cover all speeds and altitudes.

The Unique Capabilities Argument

7. Manned systems possess certain capabilities missiles do not have and are therefore necessary if we are to have a strong strategic posture. A manned system:

a. Can be recalled. This allows it to be launched on less than certain information. Launched in this situation, the manned system could be recalled or proceed on to enemy targets. Being airborne, it would be safe from the attack.

b. Can be used over and over on repeated strikes. A missile cannot be used a second time.

c. Fulfills the important role of obtaining intelligence and damage assessment information vital to planning subsequent strikes. It also provides a means of bringing mobile targets under attack.

d. Can carry large, high-yield weapons as well as multiple weapons. The ICBM can carry only one small-yield warhead.

e. Can bring to bear large yield weapons against such hardened targets as military and government control centers or to attack several targets on the same mission. This large and variable load carrying ability takes on additional significance when considering the possibility that nuclear weapons conceivably would be banned at some time in the future and only TNT weapons could be used. Under such a situation missiles become a very expensive means of delivering TNT against the enemy when compared to the bomber with its capability to carry many conventional bombs and return to carry more.

f. Can seek out, discriminate and attack targets with no sacrifice in accuracy and effectiveness. In short, it can achieve high accuracy using less accurate target data.

g. Offers a great range of flexibility in choice of tactics. For example, it can use any portion of the enemy perimeter to penetrate, with variance in both altitudes and speeds.

h. Provides the distinct advantage of human judgement during unexpected conditions. A man can disregard targets already destroyed and use his weapons on alternate targets. He has the ability to observe, think and make unrehearsed decisions.

THIS PAGE IS DECLASSIFIED IAW EO 13526

The Nuclear Test Argument

8. There exists the possibility that the moratorium on nuclear weapons tests will continue for at least the immediate future. If so, we will be denied the means to develop and improve the ratio of warhead yield to weight, a factor of great importance when related to missiles. Consequently, reliable missile warhead yield growth without testing and within reasonable weight limitations becomes most doubtful. Reliable, extremely large yield nuclear bombs are now in the inventory. When considered in conjunction with possible cessation of further flight testing of long range missiles, this factor lends weight to the continued need for the manned bomber.

The Arms Control Argument

9. Of great significance is the increasing emphasis on arms control. Although complete and general disarmament is probably not attainable within the prevailing or foreseeable political environment, partial arms control is conceivable and may eventually include space weapons, ICBM's, IRBM's, and nuclear weapons. Assuming this possibility, the future security of the nation will, as today, be primarily dependent on the manned bomber force. The continuation of this force must be planned for and programmed now. It cannot be a stop and go proposition, since many years are needed to develop and produce modern bombers and train personnel to use and maintain them.

The Cold War Argument

10. Manned systems offer cold war applications not possible with large missiles.

11. The flexibility of manned systems eases the decision-making process by providing an instrument which may be employed on a graduated scale without an irrevocable commitment to combat.

12. The options provided the decision makers may vary from an increased ground alert posture to launch of the force subject to recall. Examples include:

a. It is difficult in times of strees to let the world know, particularly potential enemies, that the readiness of the ballistic missile force has been stepped up. Nothing happens that anyone can see whereas stepping up the readiness of the manned aircraft force on alert or initiation of an airborne alert is visible to friend and foe alike.

b. To display response in a tense situation, manned vehicles could be sent to where they would be seen by Allies, or even picked up on radar screens of an enemy.

<u>The Follow-on Capability Argument</u>

13. The aging B-47's are planned to phase out of the Air Force inventory by the mid-sixties. Also, during the mid-sixties the earlier model B-52's will begin to phase out. This condition, coupled with an ever-improving Soviet defensive posture, requires modernization of our manned strategic capability. An analysis of payload, range, speed and penetration capabilities shows the B-70 to be the weapon system best suited to fulfill that requirement. <u>The B-70</u>:

a. Will provide the Air Force with the most advanced manned strategic system that the state-of-the-art now permits. It is unique in that it has been designed expressly for continued operation in the supersonic environment.

b. Will travel the entire distance of its very great range at Mach 3, which is roughly 2,100 miles an hour. This represents a major aeronautical breakthrough since it transcends the heat barrier, and conceivably opens the door to much greater speeds and further major advances in aeronautical science. This speed means that if B-70's were on alert over the polar regions and it was decided to attack, they would be over Moscow before an ICBM launched from this country could reach Moscow.

c. Will have excellent penetration capabilities. This capability is derived primarily from the airplane's speed and altitude and would be further enhanced by countermeasures, decoys, and air-to-surface missiles - all used under the monitorship of a human brain.

d. Is designed to carry a variable internal payload. It can carry several large bombs or a great many very small ones.

e. May be useful as a recoverable booster. One of the problems in space research and military space work is the boost required to propel payloads through the lower dense atmosphere into space. It may be possible to realize substantial savings by launching space vehicles from the B-70 instead of from the ground.

f. Offers great potential as an anti-satellite weapon carrier, and possibly as a long range platform for air defense missiles due to its maneuvering ability, speed, and large load carrying capacity.

g. May be adaptable for nuclear propulsion due to its design which has the crew far removed from the engines.

h. Offers the potential for assuming the role of rapid strategic airlift or paving the way for Mach 3 transport aircraft. Just as the B-52/KC-135 developments paved the way for jet transportation, so the B-70 would initiate Mach 3 transportation, freight and passenger. Under conditions of total weapons control a Mach 3 transport utilizing the B-70 design features would provide the U.S. the flexibility of rapidly transitioning from transport aircraft to weapon system should such a need arise.

THE FALLACY OF THE CONCEPT OF MINIMUM DETERRENCE.

THIS PAGE IS DECLASSIFIED IAW EO 13526

(10)

NOT A POSITION PAPER - TALKING PAPER ONLY

Hq USAF, Pentagon
Col R. C. Richardson
AFXPD-LR

THE FALLACY OF THE CONCEPT OF MINIMUM DETERRENCE

A new concept of deterrence has recently appeared. It is known as "minimum deterrence." This concept offers a panacea for the grave economic and strategic problems of our time. Like most panaceas, it is easily stated for it is based on generalizations and over-simplification.

The concept of minimum deterrence holds that a large counter-force capability is not necessary in our strategic offensive forces and, in fact, is ineffective as a deterrent to general war. This premise is based on two assumptions:

- First, that our strategic offensive forces will be used only in response to an enemy attack; and
- Second, that the enemy will have flushed his offensive forces in the initial attack and hence our counter force systems will go against empty air bases and missile sites.
- As a corollary to this second premise, the concept of minimum deterrence states that a large counter force capability which is not usable against the enemy's strategic offensive forces is excessive to our needs--that it can kill many times over the enemy targets which will be available after the initial attack.

Proponents of minimum deterrence have advanced the idea that an adequate deterrent posture can be had with a small, secure strategic force capable of annihilating area targets. In other words, the idea of minimum deterrence is based on maintaining a Free World strategic offensive capability, composed of bombers and missiles only in numbers adequate to destroy an enemy's major centers of population, but not adequate, either quantitatively or qualitatively, to destroy his dispersed and hardened offensive forces. The threat to an enemy's centers of population and industry is presented as adequate to prevent him from initiating general war. Nothing is said, however, about deterring lesser acts of aggression.

This attempt to reduce the present strategic counter-force capability to the less costly job of "city busting" is clearly motivated by budgetary considerations.

- Some seem to fear that one full conversion of the strategic offensive forces from existing weapon systems to advanced bombers and intercontinental missiles, adequate to deal with the current target system, would mean reductions in other forces and capabilities.

- Others would like to see the primary strategic target system changed from counter-force targets to cities since area targets better fit the relative inaccuracies, slow reaction times, and quantitative limitations of such systems as POLARIS.

- And, there are some who recognize that a minimum deterrent posture will provie no deterrence to aggression in peripheral areas, hence it would maximize justification for building up local limited war forces.

Now let us examine minimum deterrence as a strategy for security of the Free World. Is it the most effective means of deterring the Communist Bloc from initiating general war? Could it defeat aggressor forces if deterrence should fail? Could it provide effective deterrence to limited war? Would it, in fact, be cheaper than a deterrent based on counter force capabilities? Unless these questions can be answered affirmatively, the indorsement of a minimum deterrent concept could have serious consequences for the United States and its Free World partners.

What is Deterrence

Of all the threats which we face today, it seems incontestable that general war is the most serious.

General war is clearly more likely in the future than it has been to date. This stems from the great increase in the relative Soviet general war capability and the ensuing possibilities that:

- The Soviets might rationalize a valid "win" strategy which would warrant premeditated initiation of general war, or

— Their improved general war posture may lead them to taking greater risks in cold or limited war aggression, any of which could progress to general war.

Defeat in a general war would end the independent existence of this nation -- probably of the Free World. Only the cumulative effects of defeat in several limited wars could have a like effect. A nationl policy dedicated to deterrence of war, or to victory if deterrence should fail, must therefore be concerned first with the problem of general war and secondly with lesser wars. An ideal solution would be a security system which could deter effectively both general and limited war.

Deterrence is basically a cold war goal. Obviously, if there is a war deterrence has failed. Deterrence seeks primarily to influence the enemy's intentions. We can never know with absolute certainty what the enemy's intentions are or how our actions have affected them, however. Therefore, deterrence of attack by an enemy whose military forces are of the same order of magnitude as ours can never be certain. But differently constituted military forces will have varying degrees of deterrent effectiveness.

Military forces which will extract from an enemy a high price for victory do constitute a deterrent. Their degree of effectiveness however depends on the enemy's willingness to pay. On the other hand, military forces which confront the enemy with a credible threat of defeat under any circumstances provide a much higher degree of deterrence. Further, this second type of deterrent force is designed to support completely the only sound military and national policy, that of winning a war should deterrence fail.

A force which can do no more than make the enemy pay a high price for victory, is clearly not fully responsive to the best interests of the Free World. It should be noted that the military capabilities associated with deterrence are not necessarily synonymous with those best suited to achieving victory in either general or limited war.

It might be said, then, that deterrence is achieved by a combination of military and non-military measures, actions and capabilities designed to dissuade a potential enemy from deliberately initiating war by convincing him that the cost and the risks involved outweigh his chances of gain. A force adequate to deter under most circumstances is not necessarily a force adequate to achieve victory. However,

0490

THIS PAGE IS DECLASSIFIED IAW EO 13526

a force adequate to achieve victory under any circumstances likely to occur, is also a deterrent force to the highest achievable degree.

Relationship to Stalemate Concept

The advocates of minimum deterrence argue that a force adequate to destroy 100 or more cites will deter an enemy from initiating general war. Since both the Communists and the Free World have forces adequate for destruction of cities on this relatively modest scale, it is clear that minimum deterrence is associated with the so-called stalemate concept.

In brief, the stalemate - minimum deterrence thesis holds that since general nuclear war could never be initiated by the U. S., even if provoked by every means short of a direct attack on the homeland, general war can only begin with an initial enemy attack (also assumed unlikely) and in this case the enemy forces must have inevitably "flown the coop".

Thus, by combining the arguments that premeditated general war will never occur with the argument that if a general war does occur, the U. S. will always be hit first, one arrives at minimum deterrence as being an adequate strategy.

Although the fallacy of the "stalemate" theory is recognized in professional circles, there are other considerations that deny the validity of minimum deterrence and the resulting "city busting" strategy even more forcefully.

Minimum Deterrence Evaluated

On the face of it a counter city strategy is suspect. It violates two basic principles:

- First, that the only rational military objective in war is the enemy forces, or targets that affect the forces; and

- Second, that destruction which does not affect the outcome of the war in one's favor is irrational, and politically and morally unjustifiable.

The proponents of minimum deterrence, however, while accepting the above in principle, counter with the argument that:

THIS PAGE IS DECLASSIFIED IAW EO 13526

__ Total atomic war can only result from miscalculation or an irrational act, hence it cannot be conceived of as serving a valid political aim. The classical principles therefore do not apply. The only purpose of total war forces is to deter total war and they can do this as effectively by possessing a "revenge" potential as by possessing a "revenge" potential as by possessing a valid war-winning potential.

__ In the nuclear missile age there is no prospect of destroying enemy forces - even with the initiative since missiles can be easily concealed and/or fired on warning of any attack enroute, AND

__ Even if we could find and destroy the Soviet long-range threat we can't afford the quantity of sophisticated strategic systems required and still meet other threats which may prove equally dangerous in the long run.

The net effect of accepting the above premises is to accept that Free World survival will be gambled on our ability to deter or prevent war, and to admit defeat or at best mutual destruction should deterrence fail. This is the case in a military environment dominated by high yield nuclear weapons delivered over global ranges by missiles or manned aircraft, since one cannot show how the capability associated with a minimum deterrent force can contribute to a satisfactory military outcome should deterrence fail. This being true, it is not even the best deterrent strategy since it does not confront an enemy with a credible threat of defeat.

In addition, destruction of centers of population and industry as a means of defeating an enemy in the atomic era is both anachronistic and inhumane. It is a vestige of an era in which the key to victory lay in mobilization of a nation's potential for delivering destruction - its industry and population. Even in WW II, strategic bombing was limited to targets that were presumed to effect the military capability as evidenced by the U. S. daylight pinpoint targeting of industry, and where cities were attacked, it was justified on the grounds that this disrupted the workers and hence war production indirectly.

In atomic war, it is recognized that post D-day production and mobilization contribute little or nothing to the outcome. If true, it is hard to see what benefit is to be derived from wantom attack of cities, people, and real estate. Today, victory in general war lies not in the ability to destroy the enemy industrial and manpower potential but rather in the ability to destroy his existing capability

for delivering destruction. Hence, a minimum deterrent force is not an effective general war deterrent against a nation which:

- Has on hand, prior to the opening of hostilities, a large stock of nuclear weapons and the means to deliver them,

- Has made some provision for the security of an industrial nucleus for recovery purposes, and

- Has demonstrated willingness to sacrifice human life on an extravagant scale in the attainment of political objectives.

The possessor of a minimum deterrent force cannot take the initiative in general war under any circumstances including receipt of unequivocal warning of attack. To do so would only guarantee his complete destruction by the enemy's untouched forces-in-being.

It is also true that a minimum deterrent force could not respond rationally to initiation of general war by the enemy, for response would be no more than an act of revenge. Annihilation of the enemy's major cities could not prevent the enemy from completing destruction of the responder's nation to the extent and on a time-scale which suited his need and convenience.

A minimum deterrent force will restrain an aggressive nation from initiating general war only so long as the aggressor feels that conquest by means short of general war is a more advantageous course of action. Thus, a minimum deterrent force sets a price for victory, but one which the Communist Bloc may consider reasonable for the attainment of world domination. This concept should perhaps be labeled "partial deterrence" rather than "minimum deterrence."

Next, let us see how effective a minimum deterrent strategy and forces may be in relation to limited war.

If this country were to tailor its strategic forces to a philosophy of minimum deterrence, we could not, by virtue of our "deterrent" forces, prevent the Communists from launching limited wars in areas of their choosing. They would be well aware that our minimum deterrent force would be used only as a last resort if at all, for attack of enemy cities without an accompanying ability to destroy the enemy's offensive forces would be national suicide. A Twilight of the Gods philosophy is not part of our heritage.

0493

THIS PAGE IS DECLASSIFIED IAW EO 13526

What has deterred aggression in Europe, and in other vital areas for the past ten years, has been primarily the counterforce aspect of the general war capability, backed up by the expressed willingness to use any and all forces to defend the Free World if it should become necessary. An enemy nation is most effectively deterred from attempting major acts of limited aggression if he is made to realize that we have both the will and the physical capability to retaliate with general war forces, and that, should we do so, the resulting possession of the initiative and a counter force capability will lead to our destroying his general war retaliatory capability.

We must therefore answer our question: "Could a minimum deterrent force deter limited war?" in the negative.

It is perhaps pointless to pursue a discussion of whether a minimum deterrent force is cheaper than a strategic offensive force with a counter-force capability. A force which cannot deter either general or limited war and which cannot achieve victory is not a wise choice at any price.

We would not attempt to challenge the assertion that a minimum deterrent force would be cheaper in dollars than a counter force capability if the purchase cycle ended there. However it seems to us that a minimum deterrent force creates a requirement for unlimited forces to fight limited wars. If our strategic general war forces can neither deter limited war nor participate in it, we must then create limited war forces in quantities adequate to meet the Communist threat at any point along a 15,000 mile periphery or at several points simultaneously.

This drain on allied manpower and resources would more than offset the apparent saving in general war deterrent forces realized by conversion to a minimum deterrent force. Another effect of adopting minimum deterrence in the U. S. force structure would be to raise the cost of allied security since U. S. mobile forces - even if augmented - can never meet the demands of a limited war capability to defeat the Soviets in the NATO area alone.

Counter Force Targeting

It is often argued that in the missile age we will be unable to locate enemy force targets even if we had the strategic initiative. What are the prospects of finding lucrative force targets in the 1965-1970 time period? Obviously, a counter-force capability has little meaning if we cannot find or hit the force

0494

THIS PAGE IS DECLASSIFIED IAW EO 13526

The claim that ICBM's can be so concealed that their location will be unknown to us is specious. Current intelligence techniques should provide knowledge of the location of hardened sites during the construction period, and they won't move far thereafter. One can conceal a completed site easily by comparison with hiding the building process which requires access to roads or rails, labor, heavy equipment, etc.

While the exact location of mobile missiles may not be known, their great vulnerability to slight overpressures allows us to target these effectively on an area wide basis.

Finally, the advent of constant satellite surveillance, in the time frame of concern to us, should provide adequate back-up for ground intelligence on ICBM movements or site construction. We assume that the Soviet knows all about our ICBM sites, and I see no excuse for granting him a decisive advantage in this respect and with the lead time involved.

Thus, the Free World's strategic force structure and strategic concepts need not be influenced by an assumed unsymmetrical intelligence, recce, or surveillance capability. We must base our plans on the assumption that we can both find and reach all major Soviet missile and bomber bases by one means or another. We must then see to it that this assumption is validated by giving adequate attention to this problem.

This leaves the question of whether or not any nation's warning, decision, and reaction systems can, in practice, respond quickly enough to save the force from surprise attack. Here we can only rely on judgment. Theoretically, it is possible to build a fully automatic response to a missile attack. In practice, I doubt if either side can do so, or would accept the liabilities of doing so in the foreseeable future.

The enormity of the damage involved in unleashing a nuclear war preclude decentralization of the decision to fire ICBM's to the extent necessary to eliminate substantive delays. The lack of reliability of warning and identification devices, and possibilities of spoofing will lead to a requirement for unequivocal knowledge of the attack before responding. And, fear of accidents will keep the human control factor in the firing chain of events.

We must be ready to respond as quickly as possible to take advantage of poor timing or premature firings which would clearly motivate the decision. On the other hand, if a real case could be made for survival by quick response there would be no requirement for hardening, mobility or concealment of strategic missile sites.

THIS PAGE IS DECLASSIFIED IAW EO 13526

In summary, our strategic forces for the foreseeable future cannot rely only on survival through automatic reaction. Likewise, our strategy should not be based on the doubtful assumption that any attack of the enemy forces will be frustrated by the enemy's ability to unload his sites and bases while our attack is enroute.

From the above analysis, it seems clear that a minimum deterrence, counter economy, strategy and related force structure makes no sense in the 1965-1970 period.

Advocates of Stalemate and of Minimum Deterrence Weakens NATO

In a recent presentation on the Berlin situation, Dr. Hans Speir pointed out that Soviet aggressiveness, and the extent to which they are prepared to push the West toward war in this instance, can be attributed in part to pronouncements by responsible American officials to the effect that we would probably no longer honor our commitments to use, if necessary, our strategic forces in defense of our Allies.

There have been numerous public statements in recent months which question the willingness of the U. S. to perform its retaliatory role in the NATO defense strategy, should the Soviets attack Europe. Most of these statements claim that the advent of a Soviet long-range nuclear capability will, from now on, deter the U. S. from using its strategic forces, except in a case of a last resort, that is, in the event we are directly attacked in America, and hence these should be reduced to a level commensurate with minimum deterrence philosophies.

Effective deterrence is composed of two elements. First, a reasonably credible, and demonstrated military capability to inflict unacceptable damage upon the enemy should he engage in aggression; and second, the declared WILL to use this capability. It appears today that there are may individuals who are openly challenging the will to use our principal deterrent force in the defense of NATO.

Soviet planners, in considering the extent to which they can conduct limited aggression with impunity in the NATO area, are obviously taking into account these public statements, made by Americans, which discredit the validity of our approved national security strategy with respect to the NATO area. One comes to the unescapable conclusion that these statements are, at the very least, irresponsible in that they invite limited aggression by increasing the confidence of the Soviets in the fact that we will not retaliate against their homeland notwithstanding our commitments.

Whether the U. S. NATO strategy of the "shield" and

the "sword" is, or is not, valid at this time seems to be beside the point. If this strategy needs to be revised, then it should be revised within the councils of NATO and of the National Security Council, and not in the market place.

Today, the European public and European leaders count on the U. S. strategic retaliatory capability and on our promises that we will use it in their defense to offset the larger Soviet forces threatening Western Europe. Based on the current shield and sword strategy, and on faith in American commitments, the NATO forces have been deployed and organized so as to best complement the strategy of forward defense in Germany and strategic retaliation from the U. S. and U. K. The present efforts to publicly "pull the rug" out from under the retaliatory half of the strategy, by advocating minimum deterrence and stalemate and without solving the resulting problem of how one is to provide an effective deterrent, or a truly credible military capability, to defend NATO without the support of the strategic air arm can only lead to insecurity throughout Europe and the exploitation of the resulting weakness by the locally superior Soviet forces.

It may be useful to recall that NATO force goals have never been downgraded, or reduced, in light of anticipated returns from the U. S. strategic air undertaking.

Since the very inception of NATO, our government has sought to obtain the maximum military contribution that the countries concerned could raise and support, given as much U. S. assistance as could be justified to the Congress and the American people each year.

The first NATO plans established the minimum forces required to defend Europe without the support of the strategic effort. Following the North Atlantic Council meeting in Lisbon, it became clear to the Western world that these minimum force requirements for a local defense of Europe, give or take 20%, could not be generated. The choice, now and at that time, lay between the adoption of a global strategy, which combined strategic retaliation with the maximum NATO capability to provide the strongest possible defensive shield in Europe, or alternately, to admit inability to defend Europe at all.

Had NATO allowed the military of the various NATO countries to advise their political masters that in their opinion there was no prospect of defending their lands with the forces that could be generated or maintained locally, these political leaders would have quickly appreciated the fact that there was little purpose in making a partial effort. They would have selected a policy of neutrality

THIS PAGE IS DECLASSIFIED IAW EO 13526

or compromise with the Soviet Union in the face of no prospect for a successful military defense.

The contribution of the Free World's strategic retaliatory force to the security of Europe must be looked upon as a "rubber gasket" which stretches between the maximum forces that can be maintained locally and the level of military effort required to provide both the military and the governments of Europe with confidence in the fact that a defense effort is worthwhile.

Acting in the capacity of "rubber gasket" to fill the gap between capabilities for local defense and force requirements, the free world's strategic air contribution spans a wide range of differences. At the same time it in no way prevents a continuing effort to maximize the local capability, from developing whereever possible, into a completely self-sufficient defense.

The very fact that NATO force goals constantly exceed the ability of the nations concerned to build the forces is evidence of the effort being made toward self-sufficient defense in Europe. It is also evidence of the futility of this effort in most cases.

If we admit we have no "will" to use the strategic retaliatory forces in the defense of Europe by reducing it to a force which would clearly be used only as a last resort, we must logically reassess the security of our NATO partners on the basis of their local capabilities to deter or defend against Soviet attack. If having done this, the local capabilities still prove to be inadequate to deter or fight aggression without strategic air support, the leaders of the countries concerned will quickly recognize this. As a result they could seek to reorient their foreign policy in such a way as to seek protection through agreement with the Communist Bloc, being unable to find security in any military strategy that NATO can afford.

Even assuming that it were possible to ultimately generate a truly effective and adequate local defense and deterrent capability around the entire periphery of the USSR, the Soviet Union will certainly take advantage of the gap that will occur between the time we could build such a capability and the immediate declarations that the strategic air forces can no longer be counted upon to protect our friends in their hour of need.

In order to capitalize on the budgetary attraction of the offensive element in defense, proponents of a reduced and diversified SAC go so far as to rationalize that the classical pre-war concept of the sword and shield is now reversed. The new twist being that SAC is the "shield"

0498

which prevents either side from using strategic forces, and behind this "shield" the front line limited war conventional armed masses become the "sword" and can return to the classical land warfare games of attack and counterattack.

The minimum deterrent strategy, which is sought by critics of the existing counter force deterrent capacity, is one which would lead to unlimited requirements for limited war. Such a strategy would eventually become a far greater drain on the taxpayer, than the present one if Europe survived long enough to implement it in the first instance.

REMARKS

BY

BRIGADIER GENERAL R. C. RICHARDSON

AT THE

EIA FORUM ON LIMITED WARFARE

MILITARY PANEL

INTRODUCTION

1. In discussing limited war requirements from the Air Force point of view, I assume that this group is not particularly interested, at this time, in the theory of limited war, or in limited war concepts, but rather in the nature of limited warfare as we see it during the next decade, and as it might affect Air Force and weapon requirements, and particularly those that involve communications and electronic systems.

2. Based on this assumption, I would like to examine briefly with you some of the changes in the nature of warfare that appear to us to have taken place in recent years as a result of the tremendous advances that have been made in aircraft and missile technology.

GENERAL CONSIDERATIONS

3. First, it seems to me that there are one or two general considerations and trends that are pertinent to any analysis of the impact of technology on limited or general warfare, and the weapon requirements therefor.

THIS PAGE IS DECLASSIFIED IAW EO 13526

ON THE COST OF R&D

4. In recent years a gradual shift has taken place as between the percentage of funds in major new weapon systems that go into the research and development phase, and that directly attributable to procurement of operational equipment. If we examine past programs for air delivery systems, we find that when they terminated, and all items had been delivered, 80% to 95% of our expenditures were in the buy program. In the case of systems such as B-17's, F-80's, F-84's, and related types of equipment, a very small percentage of the overall program was directly attributed to research and development.

5. Today, in most weapons, this relationship no longer holds true. Practically every new air and missile weapon system that we now require will break out on a 50/50 basis, or near this, as between the cost of the first operational item and the cost of all subsequent items envisioned. For instance, in one particular vehicle that I have in mind, the cost of the first aircraft would run close to one billion with the total program, if fully implemented, being in the order of 2½ billion. This shift in the percentage of the expenditure allocated to production versus that devoted to research and development, has had an interesting impact on our planning.

6. In the past we were able to let our materiel agencies procure several different varieties of like equipment when

these seemed promising. After comparative tests and evaluation of the resulting experimental models, the operators and planners could select, for production, the hardware that was most promising.

7. Today and in the future this is no longer possible. With the high cost of the initial development of most all systems the planners and operators have to frequently participate in decisions as to what we will buy based upon drawing board proposals. As you can see, this limits our flexibility of choice, as well as the certainty of success. It also tends to commit us in many instances way before we would like to be committed with respect to the end items that will be introduced into the forces.

ON TECHNOLOGY VS REQUIREMENTS

8. Another matter of growing interest to industry is the inter-relationship that exists today between the rapid changes produced by technology, the costs of the new weapon systems, and the consistency in our requirements for these.

9. Today we live in an environment in which our military commitments tend to remain relatively constant or increase. We have to cover, through time, essentially these same strategic targets and provide roughly the same number of squadrons to NATO and other commands; while in addition, augmenting our capability in some areas such as space and in the limited war area. This

THIS PAGE IS DECLASSIFIED IAW EO 13526

means that in essence our commitments remain relatively fixed, or else increase, in an environment in which costs for individual systems have been rising along with their effectiveness - though not at the same rate.

10. Now, over say a 10 year span, the rate of rise in cost and effectiveness of new weapon systems has clearly exceeded any rise that we planners can rationally anticipate in defense funding. This is not a judgment but an obvious conclusion since were we to sustain such a rate, we would ultimately overtake the GNP, something which quite obviously cannot happen. When you have a situation in which you are constantly re-equipping the forces with new and more effective hardware, while remaining relatively constant in what you do and in how you do it, you find yourself eventually obliged to make compensatory adjustments either in quantity of forces and weapons, or in commitments, thus taking into account the new effectiveness that technology is providing.

11. Since changes in quantity of forces are rather difficult to come by, because quantitative requirements are frequently fixed by political considerations as much as by hardware capabilities, and since changes in concepts, the way we use the hardware, generally require agonizing reappraisals with respect to the nature of war and relative reliance on new weapons - as was the case in the New Look - we have found historically a

THIS PAGE IS DECLASSIFIED IAW EO 13526

tendency to first offset rising costs by the elimination of alternative systems where possible; systems which had been previously programmed, and ordered on the basis of pure requirements planning in times when initial funds were available.

12. The elimination of weapon systems, once well under way, is always hard both for industry and for the service concerned. To protect against this where possible, we must therefore increasingly consider the long range impact of the technological revolution and resulting cost squeeze and resist the initiation of programs which either have a low probability of being sustained over time, by virtue of the fact that the nature of the requirement or of the strategy that generates it seem to run contrary to technological, economic, political, nationalistic or other obvious trends. In other words, unless we apply in the future a qualified capabilities approach to general or limited war requirements, we see frequent readjustments to programs initiated in good faith but without regard to their long term implications in today's technological revolution.

ON THE NATURE OF LIMITED WARFARE

13. Now against this background which cautions against over-optimism as to the long term impact of increasing limited capabilities on massive procurement of new equipment, I would like to suggest to you some of the trends we see in the area of limited warfare, as they might affect electronics and communications needs and systems.

THIS PAGE IS DECLASSIFIED IAW EO 13526

14. We think that the nature of all types of warfare, including limited wars, has changed with the advent of: atomic munitions; long-range aircraft; missiles; and the ability of many systems to reach the same targets, and do the same job as each is improved.

15. The impact of the atomic development has been mainly to reduce "quantity" in favor of "quality" wherever its use might be presumed.

16. If atomic weapons are used in limited situations, however, we will obviously need rapid decisions on both use and targeting. This in turn calls for extremely accurate knowledge, based upon good surveillance systems and even better communication systems all the way up the line.

17. General Snodgrass has already discussed with us the mobility and communications implications of limited atomic warfare. The same trends apply to air forces whose dispersion and subsequent rapid concentration on the target area will call for advance communications and electronic possibilities.

18. The tremendous increase in the range and endurance of our modern aircraft, and of our missiles, has obviously increased the communications, command, and control problem. In WW II, the tactical air forces supporting land operations had to be relatively close to the front, were rarely separated

from it by water, and could easily be tied in with each other, and with their tactical warning and control by land lines or relatively short range radio communications.

19. Today this will no longer be true. The possible need to meet limited emergencies in remote areas of the world where there are no close-in, prepared, bases that can handle high performance modern equipment, coupled with the increased ranges and speed of aircraft, allows if not forces us to base at greater distances. Bases for reconnaissance or tactical air in these situations may well be at sea, on islands, or in sanctuary areas hundreds of miles from the combat zone. Under these circumstances, command and control communications between bases, and with the forces being supported, present major problems that we must solve together, if we are to have effective employment of modern air power in local wars.

THE GLOBAL CONTROL PROBLEM

20. Another new consideration of interest here is the gradual increase in participation in operational decisions by the seat of government. In WW II, and other earlier limited or general wars, the unified or theater commanders conducted the actual combat operations; made all the quick military decisions required on use of forces and weapons, and sent periodic reports back to their governments on the progress of the battle. Higher headquarters provided only broad guidance.

THIS PAGE IS DECLASSIFIED IAW EO 13526

Neither the theater reports, nor the broad guidance, had any great urgency.

21. Today the situation has changed. Even in the most limited operations we find a tremendous interplay among forces and agencies based all over the globe. The close ties between political and military operations, especially in limited war; the high probability that agencies like the U.N. will be constantly discussing each development as it occurs; and the need for readiness to respond in other areas on an instantaneous basis should the conflict expand; or to change weapon systems locally, all demand centralization of control and a steady flow of information to all concerned in the developments of the limited conflict.

22. Obviously, as operational control of the battle moves up from the local combat commanders to area unified commanders - who are generally at some distance - and the seat of government, which is even more remote; the more rapid, more intricate, and more sophisticated the communications systems must be if they are to give adequate and timely information on which these headquarters can base effective decisions.

23. Let us take an example. We found that in the case of the Chile airlift much of the operational direction came from our Air Force Command Post in the Pentagon, acting for the

THIS PAGE IS DECLASSIFIED IAW EO 13526

JCS. Likewise, in the case of Lebanon, we kept track in our Washington Command Post of the detailed movements, times of arrival, delays, readiness, etc., of our tactical air deployments, and this on an hour to hour basis. Even the countdown of missile tests are repeated to us here as they occur and in war this would, no doubt, be required if there was to be any flexibility in operations versus peace negotiations.

24. As all of you who have been associated with the communications network involved know, this minute to minute and hour to hour control from the Central Air Force Command Post requires some exceedingly complex and sophisticated communications.

25. The Air Force is probably at the top end of the spectrum with respect to the need for this type of long range rapid control. We cannot accept any delays in communications when we have aircraft on air alert, and on 15 minute standby or less. We can no longer bury decision making and transmission time, in the time for preparation for movement as used to be the case, and is still the case with those forces whose immediate commitment to combat is not quite so rapid, by virtue of the nature of their equipment or the length and nature of the voyage they must make to the combat zone.

26. In brief, whereas in the old days US power was mobilized in the US, shipped overseas over long lines of communications, and operated by the theater commanders independently of one

another and of Washington, today the situation has been largely reversed. US power is instantanseously committed from globally dispersed locations, even in support of relatively limited operations. Under these circumstances, maximum global coordination is required, and every action that takes place in a combat theater is of vital interest to commanders and government agencies all around the world, even though they may not be directly involved at the moment.

27. Additionally, the global nature of today's threat has dictated the expansion and extension of our warning systems. We have seen the growth of the DEW LINE, BMEWS, and similar extensions of warning and control. It seems quite clear that as space capabilities come into play they will in turn be required to extend our frontier in defense and warning as well as to contribute to command and control activities over our many air weapon systems.

ON DETAILED LIMITED WAR NEEDS

28. Except for the additional distances involved, and for the global reporting and control requirements, no great changes in air forces are foreseen as a result of limited war needs. For purposes of considering and speculating on some possibilities, however, I think that we might usefully categorize lesser conflicts into four types.

THIS PAGE IS DECLASSIFIED IAW EO 13526

29. First is what I would call Constabulary Actions. These are situations in which there is no overt combat, but in which UN police forces, possibly including US troops, are attempting to exercise positive control over an unstable condition, and provide essential government services.

30. Now in this situation, I see no special air requirements other than liaison and air communications. I would envision that the communications and control equipment required would largely be that associated with the needs of the land forces engaged in the control activities.

31. The next category of limited warfare would be what I would call, for lack of a better name, major police actions or counter-guerilla operations. This would be a situation in which our forces were engaged with enemy irregulars, that are not identified in specific combat zones or units. It is akin to a situation where you have hit and run activities, sabotage rather than sustained combat.

32. In this situation, our air requirements would seem to me to consist primarily of air communications and troop transports with the possible addition of some air recce. The recce might need some tactical control, though even this is doubtful in face of no air threat.

THIS PAGE IS DECLASSIFIED IAW EO 13526

33. The third category of limited actions, that I would see, could be defined as Insurrections or Revolutions. In situations of this type one would expect to find organized enemy forces and a definable combat zone. Additionally, there would be identifiable lines of communication from outside to the enemy forces, which might require interdiction. This type of warfare could also include volunteers, and possibly some locally manned, or volunteer manned, enemy air equipment, though most likely of second line, or relatively obsolete, types.

34. In this type of limited warfare, we would begin to develop the full potential of the land-air team. Whereas we would probably not require very long range highly sophisticated equipment, in view of the nature of the air threat, we would certainly need sustained communication with the land units that were operating in the theater, and line of communication; some air defense capability with its associated control and warning systems; and armed recce with suitable ground environment for useful control.

35. Lastly, we have what I would call real limited wars. These might have a conventional phase, followed by a tactical nuclear phase. In this type of wars, we would envision long-range air support based in sanctuary; extensive communications; warning and tactical control adequate to deal with fairly

THIS PAGE IS DECLASSIFIED IAW EO 13526

sizeable enemy air capabilities, and the need for air protection of lines of communications. In these wars, the full spectrum of our air capabilities could come into play to the extent that this would not jeopardize our general war posture. There would be a clearly definable need for the maintenance of air superiority in the combat zones.

SUMMARY

36. In brief, the principal new requirements imposed on electronic and communication systems by the air activities in lesser wars stems first, from the need to process, on a global basis, operational information on which to base command decisions and assess quickly developments no matter where the conflict takes place and what its size might be.

37. Next in importance from the air point of view is the ability to extend the control of our air operations in keeping with the longer ranges and the use of more remote bases imposed by lack of close-in facilities or the need to protect our expensive equipment from local firepower.

38. There will also be a need for mobile tactical control and warning systems, capable of operating in support of our long range air systems, and in areas where there is very little in the way of facilities, power, communications, etc., and yet where we must still provide air superiority over the battle.

39. Nothing has changed the requirement for air superiority in the local combat area in a conventional limited defense. At the same time, the location of the requirement has extended to all sorts of possible places on earth where facilities for control and warning are extremely limited, and where even access can be difficult. This, of course, suggests light, easily moved and efficient equipment. Additionally, however, it also means that this equipment must be able to tie in with any remote bases or control and command facilities that might have to be used.

THE DEVELOPMENT AND DISSEMINATION OF LONG-RANGE, USAF PLANS, CONCEPTS AND POLICIES AND ASSOCIATED ORGANIZATIONAL CHANGES

SECTION I

PURPOSE OF THIS STUDY

At the Commanders Conference of February 1958, the need for research aimed at changing Air Force concepts and procedures in light of technological progress was clearly recognized. On 28 February 1958, the Vice Chief of Staff, General LeMay, directed all staff agencies as follows:

> "2. NEW CONCEPTS AND PROCEDURES. (Unclas) The Air Force is involved in a great transitional period when familiar patterns will not fit and changes must be made promptly. We must coordinate our actions in the direction of new and better concepts and procedures. Resistance to change with its attendant indecision and delay must not be tolerated."

The development and presentation of new concepts is one of the responsibilities of the Long-Range Objectives Group. During the past 18 months the Group has been relatively ineffective in discharging this responsibility. Today, there is little evidence of any substantive conceptual change, nor is the Air Staff now organized so as to best generate and process proposals for change.

This study seeks to explain why "resistance to change" exists in the present Air Staff organization, and the nature of the requirement thatprompted the above directive. It recommends some of the organizational and procedural changes needed if the Vice Chief of Staff's directive is to be carried out in practice.

THIS PAGE IS DECLASSIFIED IAW EO 13526

SECTION II

WHY THE USAF NEEDS TO REVISE ITS PLANNING ORGANIZATION

To Research New Concepts and Policies

The present Air Force planning establishment cannot effectively generate those changes in Air Force concepts, policies, and unit organization which must be made in light of technological progress and the intensified competition from the other services.

In long-range planning activities, the Air Force is more advanced than other services. This effort, however, has been largely limited to considering theimpact of adding forecast weapon systems to projections of current concepts. Our objective force programs represent, largely, a runout of current programs adjusted to the availability of new equipment.

While long-range plans evidence major changes in weapons at future dates, there are no similar changes in basic organization of forces, concepts, policies, or deployments forecast to take place at specified future dates.

The difference between the amount of change anticipated in hardware, and that anticipated in the methods of its employment, can be attributed to the fact that, to date, our research effort in weaponry has far exceeded our research effort in concepts, etc. This imbalance must be corrected if we are to have sound, realistic, long-range plans and programs.

> Our present planning structure does not provide the means to conduct a truly effective R&D program in the non-technical fields of concepts, policies, and organization.

To Process New Concepts and Policies

Our present planning organizations and procedures cannot effectively process such changes in policies, concepts, and organizations as are now developed within the Air Staff.

THIS PAGE IS DECLASSIFIED IAW EO 13526

Major changes are initiated in two ways. The staff proposes and the Chief approves; or the Chief, on his own initiative, directs in broad terms and the staff figures out how to implement. Our current procedures are almost wholly oriented toward obtaining decisions on the basis of the former, or completed staff action, method.

When dealing with contemporary matters completed staff action is a sound prerequisite to decision.

When dealing with future concepts, changes to be made in functions, roles, missions, etc., completed staff action tends to prevent any change in these areas.

Coordinated staff action can never produce the imaginative proposals for change in policy, functional, and conceptual areas called for by recent technological advances.

Decisions such as to eliminate the conventional capability from any and all the forces beyond a given date; to completely absorb a function or activity at a future date; to plan a reduction in national commitment and then proceed to seek to get the commitment changed, etc., can only be initiated at command level.

We clearly need some means by which the command echelon can obtain, and entertain, proposals for long-range changes in the conceptual, policy, and functional fields.

When the command echelon lacks the time to study these questions, and give guidance for change on their own initiative, the proposals have to be generated, in broad terms, by qualified experts. These must then be treated as if originated by the Chief or Vice Chief who, after discussion on a personal basis with their senior advisors, directs the staff to seek the desired changes.

At present, no staff agency is in a position to provide the command section with the type of raw material they need if they are to make sound command decisions leading to conceptual, functional and policy changes.

The Chief of Staff, USAF, does not have a "brain trust" group as does the Chief of Staff, Army, and CNO (Asst Chief of Staff for Long-Range Objectives, OP-93). Overwork on current joint matters, plus custom and coordinated procedures, prevents Plans and Programs from fully meeting this requirement.

THIS PAGE IS DECLASSIFIED IAW EO 13526

<u>Our present planning organization and procedures do not provide the command echelon with new ideas and guidance on which to base command decisions to change current policies, concepts, functions, etc.</u>

Nowadays, the Chief of Staff needs, not only imaginative guidance on future Air Force objectives, but also guidance on current strategic and conceptual ideas -- from an impractical point of view, for his information in acting on the JCS.

JCS positions developed in the Air Staff are obviously, and properly, influenced by Air Force interests. When the Chief is representing the Air Force these meet his requirements. There are occasions, however, when the Chief of Staff must take a purely national point of view. While in theory this is provided by the Joint Staff, in practice, arguments contrary to Air Force interests -- even though they may be valid -- are seldom presented.

<u>In our present planning organization and procedure there is no office that provides the command section an analysis of strategic and conceptual views not influenced by Air Force interests or past Air Force positions and policies.</u>

<u>To Disseminate New Concepts and Policies</u>

The more we centralize authority on defense matters in the civilian echelons of OSD and above, the more important it becomes for Air Force officers associated with these agencies, and for Air Force supporters, to have a clear and concise knowledge of the views of the Air Force on basic questions of concept, strategy and security policy.

We do not have, today, the amount of agreed guidance on conceptual and strategic questions that the other services have, nor do we effectively disseminate that which we do have. We have nothing comparable to the Army Pamphlet 20-1, "A Guide to Army Philosophy," to Admiral Burke's "The Navy of the 1970 Era" and to many similar papers issued by other services, and which call for allegiance to their long-range views and objectives in vital areas.

Air Force officers outside of Plans are not provided any specifically approved conceptual or strategic guidance to study and fight for. In addition, they have no one source from which they can obtain advice on these matters. Generally speaking, even within Plans we can get several

different points of view on any issue depending on whom one discusses it with.

The need for the dissemination of Air Force conceptual views was clearly indicated in an analysis of Armed Forces Day speeches by Air Force officers, conducted by AFXAC. They found:

a. A complete lack of emphasis on issues of clear interest to the USAF. Out of 522 pages in 42 speeches there were only: 3 pages devoted to Limited War Theories; 2 to Unification; 1 to DOD Reorganization; and 1 to Aerospace.

b. "That Air Force views, arguments and information are not very well expressed at present by most of the senior Air Force officers who have the greatest interest in expressing them; that some of the present views of these senior officers should never be expressed at all; and that other views, which should be expressed, are not even being mentioned."

The Assistant for Coordination recommended, based on the above analysis, "that in addition to the recently inaugurated SAFIS program to provide guidance .... this guidance be expanded to include long-range planning and projects under the direction of DCS/Plans and Programs."

While during the past year we have made some attempt to coordinate Air Force statements and policies both through SAFIS, and through the establishment of AFXAC, the effort has been largely limited to current positions. The dissemination of guidance on future positions, as attempted through the AFOS Series documents, has been delayed and resisted to such an extent that the output has been minimal. The last long-range strategic guidance provided major commands on conceptual and force structure matters was FSPO-71 developed and distributed in 1956.

<u>In our present organization and procedures we do not provide clear and effective channels and actions to obtain maximum support for our concepts and policies from our officers and friends</u>.

<u>Summary of Why We Need to Reorganize</u>

There are clearly three problems:

The first one is to so organize our planning

THIS PAGE IS DECLASSIFIED IAW EO 13526

establishment that we can develop, obtain, and rapidly process new ideas and proposed changes in the conceptual and policy field as necessary to keep abreast with political changes and technological progress.

The second problem is to establish procedures and relationships which recognize the fact that radical changes in concepts and policies -- even where clearly needed -- cannot be proposed to the Commander through normal staff procedures and channels.

And lastly, we must so organize and orient our activities as to insure that our views and objectives are promptly made known to our people, and our supporters, along with our reasons therefor.

Due to the fact that our present Plans organization emphasizes current JCS and USAF problems, we have not been able to get "on top" of such vital issues such as "The future organization for space warfare," "Nature of a single service structure," etc. To do so requires that research and development in the related concepts and policies be initiated before these issues become matters of Joint or National concern.

The facts seem to be that today the USAF is:

__. Not generating, or adequately disseminating, the clear, timely, long-range guidance, and the new positions, policies and philosophies, needed if we are to remain strong and virile.

__. Losing ground to other services, and to civil authorities in the Joint, and National affairs arena by virtue of having defensive, status quo, reactionary positions on most issues for lack of being able to "take the lead" in influencing events.

There appears to be some justification for both criticisms. The record is clear. Many internal conceptual or policy guidance papers and studies, such as the AFOS, the 1970 Era paper, the WPL, etc., take a week or less to draft and, in most cases, over a year to process. Most substantive proposals for conceptual, organizational, or functional changes never get to the command section for lack of unanimity of agreement within the Air Staff itself.

While the Air Force has won many local battles within the confines of the JCS, other services have pressed their

strategic views and ideas on a far broader front and are now beginning to reap the benefits from this effort.

University study groups, influential writers, civil authorities, and the public are more and more convinced we must: change NATO strategy, emphasize limited war, give the Army air defense missilery, build NIKE-ZEUS, prevent the Air Force from monopolizing space; disperse strategic delivery systms to other services and to unified and allied commands; build up our conventional land power, etc.

Conversely, it is hard to list any policy or strategic goals, nor already accepted, that the Air Force is publicly fighting for, other than "more of the same," and a "single service" whose nature we cannot even clearly define.

THIS PAGE IS DECLASSIFIED IAW EO 13526

SECTION III

STRENGTHS AND WEAKNESSES OF THE PRESENT STAFF PLANNING ORGANIZATION

In General

The main strength of our current planning effort lies in its recognition of the need for long-range planning, particularly in the program projection and materiel field. We are also well organized when it comes to the rapid processing of day-to-day JCS agenda items, albeit at the expense of a balanced effort in other areas.

The main weakness in the current planning effort stems from the fact that it is largely devoid of any provision for objective, independent, research in military science to accompany the long-range materiel and force projection studies.

By-product shortcomings of the lack of study in the area of policy and conceptual change are:

a. The lack of procedures to facilitate command consideration of changes in these areas

b. The lack of effective dissemination of Air Force views and objectives needed if we are to influence events and,

c. The lack of adequate attention to means of influencing the decision mechanism.

If the Air Force is to maintain its lead in formulating our national security policies, we must have a Plans organization and procedures that meet the following criteria:

a. Provide an adequate effort in research and development, not only in hardware but also in the military sciences.

b. Effectively process the ever-increasing JCS agenda, and other current actions.

c. Provide procedures wherein the findings of a above can be processed, and new Air Force objectives quickly considered and effectively directed.

d. Insure that both current Air Force views, and future objectives are quickly and clearly made

THIS PAGE IS DECLASSIFIED IAW EO 13526

known to those within, and without, the Air Force able to assist in their realization.

e. Maximize the receptivity of decision making echelons to Air Force views and objectives.

Let us briefly examine the present planning organization in the Air Staff in the light of its effectiveness in meeting the above needs.

In Developing New Policies, Concepts and Objectives

Our Air Force peacetime planning structure is not best-suited to meeting the new requirement for an effective research and development program in military science. Although the Air Force has developed its planning techniques and procedures to a greater degree than any other service, the effort has been, and remains, almost wholly oriented toward "maintaining and modifying" existing plans, policies and concepts.

To date there has been a minimum of "in house" effort devoted to research and development in concepts and policies for the Air Force of the future. The function of researching possible changes in these areas has largely been left up to schools, combat commands, and scientific research groups.

Although Plans and Programs has the responsibility for the development and dissemination of future Air Force concepts this effort has taken second priority to that of meeting JCS agenda requirements. Those studies that are undertaken in War Plans and Policy have generally been "triggered off" by a current JCS or NSC action. As such, the findings are properly influenced, from the start, by considerations of feasibility, cost and service implications.

In brief, there is little or no organized Air Staff effort to "get ahead of current problems" by undertaking pure conceptual research with the objective of coming up with new ideas, and without having pre-conceived conclusions or being constrained by arbitrary suspense dates and/or the need to remain within the scope of existing Air Force, Joint, or NSC policies.

An excellent example of the organizations' inability to meet this requirement, and the result, is the recent "flap" over the Navy proposal for a unified space command.

THIS PAGE IS DECLASSIFIED IAW EO 13526

The chronology is clear:

a. As early as April 1958 the Chief of Staff stated his view with respect to the importance of space to the future of the USAF.

b. On 28 February 1958, the Vice Chief of Staff directed the staff to study space concepts and assignment of roles and missions.

The requirement to research the space field was clearly recognized and established. On 26 March 1958 DCS/P&P submitted a first effort toward the above "Initial USAF Concepts for Space Control". This paper, returned to DCS/P&P for further study, is still in staff coordination today, 20 months later.

While the Plans and Programs study was by no means perfect, nor would it have provided answers to the recent Navy challenge, it would have generated other studies and actions. Given prompt attention in the spring of 1958, we should have completed research on all aspects of space organization, and a whole family of studies by mid-1959. In fact, we are still trying to get agreement on the first original effort, meanwhile meeting the Navy challenge by a crash program to develop our defenses and views.

The fault lies with our organization and procedures, which favor current actions to the exclusion of research and development in future concepts and policies. When the current day-to-day workload is excessive, efforts to produce broad studies, as required in the space example, receive such low priority, both in development and processing, that the output is negligible.

We should have an "in house" long-range objective effort able to study the evidence, collect knowledge and ideas from all sources, and then point out in papers, briefs and recommendations where changes seem logical, essential, inevitable or advantageous. Our small long-range objective effort has been unable to do this not only for lack of staff, but also because we seem to be unable to:

a. Get considered thought and discussion given to new ideas by others in the staff. We need "equal time" with current problems.

b. Avoid coordination to a point where it becomes counter-productive.

c. Overcome the tendency to avoid facing the difficult or unattractive decisions inherent in any proposal for change, since these inevitably criticize present positions.

One basic cause of the shortcoming is quite clear. Overwork with current problems, and deadlines, in most of the planning staff leaves little time and no desire for work on theoretical problems which can be postponed.

Although Plans and Programs is responsible, in principle, for all aspects of long-range air policy and planning, in practice, 90 percent or more of our man hours are devoted to "maintenance and modification" of past and existing National, OSD, and Air Plans and Policies. There is little or no pure Research and Development going on which is uninhibited by current problems, directives, and conditions. Directed studies rarely produce new ideas.

Even if the press of day-to-day work, the meeting JCS agendas, etc., - allowed time for pure research and development in the nature of future warfare, and in the resulting conceptual, functional, organizational and doctrinal changes which it indicates, the assignment of "R&D" to "Maintenance" is organizationally unsound and counter-productive. This is a recognized fact in the materiel field. It is no less true, though less clearly appreciated, in the policy and planning field.

Individuals who are overworked in trying to deal with the problems of the moment can hardly be enthusiastic about proposals that tend to undo, or negate, the carefully built-up positions they have established, that create more work, and that often imply criticism of the programs with whose development they are associated.

The impact on the future of the Air Force of the efforts of the other services to sell their concepts will be disastrous unless we face up to this problem in the near future and reorganize our planning and policy effort to meet the new need for peacetime conceptual research and for change, wherever change is indicated notwithstanding the inevitable opposition of those affected within the Air Force.

The "in house" Air Force research in concepts and policies should be so separated organizationally from the day-to-day joint planning activities, that neither element has a veto or control over the other. Obviously, the long-range planner who is trying to put over a new

THIS PAGE IS DECLASSIFIED IAW EO 13526

proposal is not going to agree with the current position. Conversely, the individual who has been fighting for the current positions is not interested in changes that imply criticism of it. He looks upon these as dangerous.

There is a clear need to differentiate organizationally between, and separate out, the function of maintenance and modification of current concepts, plans and policies from that of Research and Development in future concepts, plans and policies.

In Processing Current Actions

The present Plans structure and procedures are focused to meet the requirements of day-to-day actions. Most of the planning staff is engaged in this activity. The attention given to putting our fires in individual trees is excellent. The attention given to instituting fire protection measures for the forest as a whole is, comparatively, negligible. This stems partly from a lack of general recognition of the importance of the latter effort, and partly from the fact that the current problems have to be solved while the others can be postponed.

The principal weakness apparent in handling the current effort stems from the workload versus manpower available. In any endeavor the worth of the end product will vary directly with the time available to develop it. Crash efforts, overtime, short suspense dates all lead to less thorough solutions. When this occurs a vicious cycle is set up:

a. Overwork by those qualified leaves them no time to produce guidance without which others cannot help take on some of the work.

b. The less Plans puts out internal guidance on Air Force policies, views and positions the more we find it essential to staff all actions in Plans for the sake of continuity.

The above cycle is insidious because it occurs gradually, leads to almost unavoidable centralization of authority in Joint, NSC, and OSD matters; and will produce effectively only until the workload imposed exceeds the saturation point. If and when this occurs, however, the systems collapse for lack of having progressively prepared a larger production base to meet the increasing

THIS PAGE IS DECLASSIFIED IAW EO 13526

demand. The warning signals in any staff are:

__. Increasing overtime.

__. Decrease in percent of successful outcomes.

__. Friction in the staff and lowering of morale.

__. Increasing delay in processing any actions that can be deferred.

__. Requests for more and more staff.

While the current situation in this regard is not acute, the workload resulting from the new JCS structure appears to be on the increase. OSD, State and Congress are generating more and more problems, and the technological revolution discussed in Inclosure A has vastly increased the time required to deal with the simplest questions.

Thus, it is clear that if we are to provide an adequate effort to planning the future of the Air Force in DCS/P&P we will need to either increase the staff or reduce the current day-to-day load. Since increasing the staff does not reduce the load on the Director and DCS, who must also give their attention to future problems, decreasing the workloads appears to be the obvious solution. Let us examine it.

There appears to have been a tendency, in recent years, to seek increasing responsibility in Plans and Programs, for formulating, deciding on, and briefing the Chief of Staff on all matters of JCS, OSD, or NSC concern. At the same time, we seem to lack either the time, breadth of knowledge, or number of qualified people to discharge the growing tasks. This results in inordinate time being devoted to day-to-day problems, in order to just keep up, and in placing too much reliance on the views of a few while failing to fully exploit the sources of knowledge in other parts of the Air Staff.

A basic principle of sound organization is not to acquire more responsibilities than one can effectively discharge.

Although it is argued that centralization of Joint actions is essential to a coordinated JCS position there is no scientific support for this view. In the final analysis, positions are coordinated by the negotiator, generally the Chief of Staff, or DCS. To have them all focus at a lower level reduces the negotiator's need to coordinate and also results in his abdicating much of

his authority to the lowest level through which all actions pass.

If no "in house" guidance exists, positions are taken as issues arise; hence, the less "in house" guidance the greater the need for centralizing joint actions. On the other hand, if adequate guidance is developed and disseminated on important issues current actions can be decentralized and yet remain consistent in position and objective by all reflecting the policies laid down in the "in house" guidance.

The effectiveness of the Air Force in obtaining its objectives will vary with how well we can focus the most qualified talent in the Air Staff, and adequate study time, on each problem.

The disadvantages of centralizing responsibility in DCS/P&P can be offset by centralizing qualified people and increasing the Plans staff - up to a point only. We have an excellent staff in Plans, but I question if it is any more qualified than the staff in some other divisions. When, in addition, it is overloaded with work, "thinking" time goes down.

How to compromise effectiveness with the desire to consolidate in order to get more continuity and coordination is a classical organization problem. When the caliber of the output decreases in an organization, increased centralization of authority tends to cover up the shortcomings by reducing the competition that shows up the weaknesses, but it can never offset these weaknesses. Some centralization in formulating the Air Force position is desirable -- too much is self-defeating.

In the past, Operations contributed a great deal to actions on Joint matters. The DCS/M and others also had a greater role in preparing and presenting directly the Air Force position, particularly on matters relating to their responsibilities.

Given adequate "in house" guidance developed within DCS/P&P, any major Air Staff division should be able to adequately staff most current Joint actions.

I am convinced both Plans and the Air Force would benefit if we now begin to reverse the trend toward absorbing more and more responsibility for Joint and National affairs in Plans and Programs.

If we ever needed a team effort in the Air Force it is now when we face difficult conceptual problems discussed herein; and the need for new ideas and bold

decision unanimously and loyally supported. We must reduce the workload by decentralizing if we are to fulfill our responsibilities in these areas.

A first step in improving the procedural and organizational setup in Air Planning is to broaden the staff base that backs up the Chief of Staff in Joint and National Affairs. This requires initially more emphasis on internal guidance distribution, and subsequently a re-distribution of responsibilities for JCS actions within the Air Staff.

In Processing New Concepts, Policies and Objectives.

Most of the major changes that are proposed from within the Air Force are effectively resisted by the Air Staff. This stems partly from the fact that managerial efficiency opposes change in any large organization, and partly from the fact that major changes have to be directed from the top if they are to overcome this resistance.

The Air Staff is neither organized nor oriented psychologically toward providing its command echelon with the type of guidance they need if they are to insist upon major shifts in policy. Our present procedures call for presenting only well-coordinated and agreed plans, programs and proposals, all of the implications of which have been considered in detail. Proposals involving major changes will seldom qualify under this criteria.

It is almost impossible to process a new idea through the staff coordination required in order to get it considered by the command echelon. This stems less from any disagreement with the idea per se than from unwillingness to coordinate on something contrary to approved and existing NSC, JCS or Air Force policy. Since all matters of substance have been dealt with at some time in all these policy papers consideration of change becomes impossible.

Changes in Air Force programs, concepts, or policies are initiated in two ways. The staff proposes and the Chief approves; OR, the Chief, on his own initiative directs in broad terms and the staff figures out how to implement. We lean too much toward making decisions entirely in the first way - completed staff action.

When processing current matters completed staff action is a sound prerequisite to decision.

When processing future concepts, changes to be made

0538

THIS PAGE IS DECLASSIFIED IAW EO 13526

in functions, roles, missions, etc., completed staff action tends to prevent any change in these areas.

We need to devise an organization from which the command echelon can obtain, and entertain, proposals for long-range changes in the conceptual, policy and functional field which are generated by our research efforts.

In an optimum organization, the research and development element should present their views to the appropriate decision level. If they are accepted, then this decision level, Director of Plans or above, re-directs the Joint day-to-day element as necessary to bring about the changes recommended in a gradual and proper manner.

It should not be a question of either side of the house agreeing with the other as to either what should be done in the future, or what is the best course of action at the present in order to get to the future.

Since nature abhors a vacuum, and the need for peacetime decisions calling for bold changes in conceptual and functional areas is becoming increasingly apparent to all, non-military "experts" are moving in to fill the void.

Strategic and conceptual ideas which should be presented by military staffs are instead being "sold" to the Chiefs and the country at large by foreign policy study groups and writers like Kissinger, Nitze, Wohlstetter, Brodie, Joe Alsop, etc.

The ability of the military to solve their own conceptual problems is further reduced by parochial service considerations and conflict.

A sound planning organization in this age of revolutionary change in peacetime must not only process day-to-day, fully staffed and coordinated action up through normal channels - as we now do, but also provide an adequate capability and suitable direct channels to:

a. Review conceptual writings and studies and brief these for the Chief of Staff (not now done on an organized basis).

b. Develop broad guidance for the Chief of Staff on major conceptual questions, where command decision for change seems indicated. (Most proposals now screened out by requirement for staff coordination of full knowledge of all consequences.)

c. Provide guidance on the views and positions of

other services, with an analysis of their validity from a JCS member point of view; and without regard to their impact on the Air Force. (Positions now presented are those of Air Force, which are not always objective when it affects us.)

The Navy has solved this problem by removing the Long-Range Objective function from normal channels, and having it report directly to the CNO. The Army tried the Navy solution, but with an inadequate effort both rank and strength wise. Both services now see the requirements; neither appears to have found a truly effective solution. (See Section IV below, Army and Navy efforts to meet the challenge).

We must devise procedures in which the command section can give positive direction for changes in Air Force objectives, without being limited to staff proposals emasculated by over-coordination and current policies.

In Increasing and Disseminating "in house" Guidance

Not only is there a relationship between the amount of "in house" policy and conceptual guidance generated and disseminated and the extent Joint actions can be decentralized without loss of coordination, but there exists an absolute need for increased guidance if we are to compete with other services in the public arena.

Plans is largely responsible for providing formal long-range conceptual planning guidance to Commands and the other staff agencies within the Air Force. The record suggests that we are no longer adequately organized to discharge this responsibility due to the increased Joint workload. Let us consider a few examples:

a. The last objective force structure made available to commands was FSPO-71, issued in 1956. FSPO-72 was distributed only within the Headquarters in 1957.

b. On 14 February 1958, our recommendation to eliminate FSPO and substitute the AFOS as guidance within the Air Force was approved. By mid-April 1958, nine (9) AFOS were in draft form and being circulated for coordination. To date, October 1959, only seven (7) of the papers drafted over a year ago have been fully processed. It has

taken an average of 10 months to staff a two or three page guidance paper AFOS, even though it contains relatively unsophisticated guidance.

o The Army War College initiated a desire to present Air Force conceptual views in February 1958 if we could provide them with some guidance. The 1970 paper of the Navy and Army PAM 20-1 were used as examples of what they wanted. In May 1958, we processed a first draft through nine major directors in Headquarters. Today, 18 months later, the Air Force still has no approved conceptual guidance paper on distribution to the schools, contractors, the AFA and similar addressees.

Unless we provide "in house" guidance, the agencies that need it will develop their own thus producing conflicting positions and views. An example of this is the strategy and concept set forth in Development Planning Objective Studies (orange books). With the most recent edition they indicated that the guidance was taken from the approved AFOS. This is as it should be.

Adequate "in house" conceptual guidance is also essential if we are to present a strong united front to the public and Administration.

Staffs of senior officers have to write their speeches. Where AFOS, the 1970 Era paper, etc., exist the views are extracted. Where they do not exist, each writer and speaker substitutes his own to the detriment of our presenting a common front.

AFXAC in their effort to coordinate Air Force policy statements is very conscious of the apparent lack of adequate internal guidance on important strategic and conceptual questions.

A recent analysis of some 522 typewritten pages of speeches given by senior general officers of the Air Force, on Armed Forces Day 1959, indicated the lack of any coordinated effort to explain to the public the Air Force position and Air Force views on those matters that are of foremost importance to us at present. Most of the 522 pages were devoted quite properly to various matters related to the speakers' own field of activity, but there were some fifteen subjects of a general nature which could be classified and measured. These subjects were emphasized in the following order:

THIS PAGE IS DECLASSIFIED IAW EO 13526

Subject	Pages
Deterrence	55
"Mixed" Force	26
Air Defense	16
Evils of Communism	15
Airlift	7
Economics	6
Budget Size	3
Limited War	3
Unification	2
Survival after Atomic Attack	1
DOD Reorganization	1
Aerospace	1

Two things are apparent from the above analysis. First, relatively inadequate attention is being given to various subjects on which the Air Force is currently interested in putting across its views and objectives. Specifically, the role of the Air Force in space; our desire to obtain greater unification; our views opposing the position of other services on the importance of limited war; and the questions of airlift, survival after atomic attack, and budget.

Second, the views expressed on these matters, when they were discussed were not wholly consistent and often failed to exploit some of the strongest arguments. In a few cases they actually detracted from the achievement of our basic objective.

It is clear from the above, that we are not taking adequate steps to provide our people in the Air Force with an explanation of the views and positions that we have adopted on basic issues and that we desire to have them explain to the American public at each and every opportunity. Our "in-house" guidance on these matters is inadequate.

Another obvious conclusion is that we have made no particular effort to impress on Air Force people the importance of devoting time and effort to "selling" the Air Force views and concepts which they now have available or which we might subsequently provide them in greater quantity. Obviously, the second requirement must be adjusted to the former.

> The development and dissemination of USAF policies, concepts, and objectives must be increased first as a basis for broadening the Air Staff capability to act in a coordinated manner on Joint issues, and next to provide guidance for public writings and statements in support of Air Force interest and objectives.

SECTION IV

ARMY AND NAVY EFFORTS TO MEET THE NEW CHALLENGE

The other services have recognized in varying degrees the need to organize their efforts so as to develop, process, and disseminate long-range objectives, concepts, and policies of special interest to them. Their experiences are worth considering since their solutions have not all been completely satisfactory, and in the case of the army, further changes are now under study.

The Army Organization

The Army has not as yet evolved a fully satisfactory organization to deal with the requirements set forth in Section II of this study although they attempted to do so, with only partial success, by establishing a "brain trust" group at Chief of Staff level several years ago.

The need for research and development in the conceptual field, and for a coordinated and positive efforts to disseminate Army views and objectives, has been more acute in the Army than in the other two services for the following two reasons:

a. For the past several years the Army's share of the budget has declined in relation to that of the other services. Air Force gains percentage wise have almost wholly been made at the expense of the Army. As a result, the Army has been concerned lest its influence in National Security Policy decline. (See chart, Inclosure B)

b. Since the advent of atomic weapons there has been a growing lack of confidence within the Army as to the usefulness of large classical land formations in the future. This has led to a frantic effort to research all conceptual, strategic, and doctrinal possibilities in search of a solution that will perpetuate the justification for Army forces and formations in the new environment.

Sensing the fact that any major war with nuclear weapons would lead to a post-war defense structure, which would have no Army in it, as defined by current roles and missions, the Army realized that its future depended upon winning over

The Army Organization

The Army has not as yet evolved a fully satisfactory organization to deal with the requirements set forth in Section II of this study although they attempted to do so, with only partial success, by establishing a "brain trust" group at Chief of Staff level several years ago.

The need for research and development in the conceptual field, and for a coordinated and positive efforts to disseminate Army views and objectives, has been more acute in the Army than in the other two services for the following two reasons:

a. For the past several years the Army's share of the budget has declined in relation to that of the other services. Air Force gains percentage wise have almost wholly been made at the expense of the Army. As a result, the Army has been concerned lest its influence in National Security Policy decline. (See chart, Inclosure B)

b. Since the advent of atomic weapons there has been a growing lack of confidence within the Army as to the usefulness of large classical land formations in the future. This has led to a frantic effort to research all conceptual, strategic, and doctrinal possibilities in search of a solution that will perpetuate the justification for Army forces and formations in the new environment.

Sensing the fact that any major war with nuclear weapons would lead to a post-war defense structure, which would have no Army in it, as defined by current roles and missions, the Army realized that its future depended upon winning over

at any cost airpower missions and responsibilities which had better long-term prospects of remaining valid. In order to do this, it was also necessary to maintain justification for the classical land force roles long enough to provide a base from which to fight for, and to seek the new missions.

The Army's planning activity has thus been characterized, during the last few years, by an effort to obtain an increase in funds, and in roles and missions at the expense of other services, and more paticularly the Air Force. This differs from that of the Air Force in that it is an offensive effort as compared to our defensive, or protection effort aimed only at retaining control over what we consider to be primary Air Force roles and missions.

The offensive nature of Army planning dictated by the above objectives led them to the establishment of a "brain trust" group to mastermind the attack and quickly develop and process answers which would serve their purposes. A major effort was also initiated to disseminate their views and to insure that all Army personnel effectively supported the objectives.

The Army has therefore had more recent experience than the Air Force in organizing its people to "sell" concepts and policies, regardless of their relative worth, as well as in recognizing and making changes dictated by the tremendous impact that the possible use of atomic weapons has on land warfare.

For example, whereas the Air Force basic wing strength and organization has changed little from its WWII composition, the Army, under the duress of the obsolescence of conventional mass, was able to completely reorganize its basic division into the so-called pentomic division, and this notwithstanding the tremendous pressures against change which are inherent in any large organization.

It is my understanding that the pentomic organization was not developed, and put across, on the basis of normal staff procedures and recommendations. Instead it resulted from the views of one or two key people, such as General Gavin and General Taylor, supported by a small, select planning staff. This group persuaded the Chief of Staff that it was in the Army's long-term interest to direct this major organizational change, notwithstanding the objections and non-concurrence of most of the special staff and support and services branches. This particular situation constitutes an excellent illustration of the problems of "change" in the conceptual and organizational field in peacetime, and the resulting need to establish a

THIS PAGE IS DECLASSIFIED IAW EO 13526

somewhat different approach to achieving these than normal staff coordination procedures.

The Army is encountering the same problem of over-centralization of the responsibility in handling current Joint and Combined support matters as we are. Specifically, when the workload becomes excessive thinking time decreases, positions become inbred and inflexible, and loss of effectiveness begins to offset the benefits of coordination sought through centralization of the JCS action under DCS/Operations.

In the Army the DCS for Operations is not only responsible for developing and presenting the JCS position, but he also has responsibility for all military training and organization matters and activities of the Army.

While the Army effort is centralized under DCS/Operations, the Army Operations Division unlike the Air Force, is considerably larger and more diversified than the other Army Deputy Chief of Staff offices.

In effect, the Army organization approaches more closely the earlier Air Force organization in which we had a DCS/Operations who had control over both Operations and Plans but was, organizationally, at a level which left the Director of Plans and the Director of Operations, more comparable to the Deputy Chief level in the present structure. Although it may appear that the joint support activities of the Army are centralized in one staff division, as in the case of the Air Force, in fact, a more comparable situation would exist if both DCS/Operations and DCS/Plans and Programs shared the load in the Air Force under one overall Deputy Chief.

In the Army long-range service objectives, and new concepts, are approved by the Chief of Staff, and Vice Chief based primarily on the assistance and advice of ad hoc study groups, or on recommendation of a Coordination Group which reports directly to the Chief of Staff through the Secretary of General Staff. This element is equivalent to the small "brain trust" the Air Force had under earlier administrations. It is the follow-on to the "party line" planning organization formally headed by General Metheney.

The Army's "Coordination Group" lacks the stature and size of the Navy's Director for Long-Range Objectives. On the other hand, it does provide a direct channel for recommending changes in the policy and conceptual field to the Chief of Staff, and with a minimum of prior staff processing and coordination.

The Army planners involved seem to feel that the

"brain trust" approach to long-range objectives, and the direct relationship of the Coordination Group to the Chief, has the following advantages and disadvantages:

ADVANTAGES

1) Effort free from influence of current plans problems.

2) Eliminates "throttling" effect of coordination at any level.

3) Maximizes implementing action, source being C/S office.

4) Maximum flexibility in dissemination of service position.

DISADVANTAGES

1) Limits scope of effort possible. No outlet for useful but trivial findings.

2) Tends to antagonize other senior staff heads. Cuts into normal chain of command.

3) Remote from sources of current information.

4) Chief and Vice Chief lack the time to devote to this activity.

On balance, the disadvantages seem to have outweighed the advantages of a small "brain trust" group at C/S level. The Army group has found this to be the case and are reconsidering their position in the staff. The "brain trust" also tends to produce a party line activity leading to adverse publicity as was the case with the Metheny Group and the Navy's "OPs 23", or else becomes a "catch all" for odd projects as is now the case in the Army.

In summary, the Army's Coordination Group has been studying the Army's planning organization under the direction of the new Chief of Staff. The general tendency in their solution, which remains as yet incomplete, is to broaden the base of the JCS support activity to permit DCS's, other than Operations, to staff JCS agenda items. The Group now takes the Armed Forces Policy Council items and staffs them across the board in this broader manner. Since it works well for AFPC items it should work equally well for JCS items.

The Navy Organization

The Navy became cognizant of the lack of an effective long-range planning structure some years ago under the prodding of the then Secretary of the Navy, Mr. Gates. At that time Mr. Gates had, I understand, Air Force Plans present a briefing to him of how we did our long-range planning.

THIS PAGE IS DECLASSIFIED IAW EO 13526

The Navy, though not suffering from quite the same budgetary reductions as the Army (see Incl B) still realized that their position as a co-equal member of the defense team, in the nuclear-air-missile age, was becoming increasingly tenuous. This in turn dictated greater attention to careful Long-Range Objectives planning and an increased effort to disseminate Navy views on concepts, goals, etc. The Navy of the 1970 Era paper is an example.

The Navy has recognized the impossibility of processing changes and new ideas through normal staff channels. They, therefore, created a Long-Range Objectives Group at the Assistant Chief of Staff level and made it independent of the overall Navy planning effort. This is the office of the Director of Long-Range Objectives (Ops-93).

Concurrently, the Navy established a long-range studies project at the Naval War College. While this group is just now being manned, it is understood that they will work primarily as a field office for the Director, Long-Range Objectives, where conceptual research can be done free from the pressure of current affairs.

The Navy's Long-Range Objectives Group is headed by Rear Admiral Rivera. He has a staff of 3 Captains, 2 Commanders and several senior civilian technicians and scientists.

The principal functions of the Navy's Long-Range Objectives Group are as follows:

1) "Study subjects of interest to the Navy for the period from the present extending through approximately 10-15 years in the future."

2) "Study and propose optimum means of obtaining for the Chief of Naval Operations the advice of qualified scientists and other experts on the foregoing problems, through the employment of individuals, the establishment of permanent study groups, and the initiation of special studies, as may appear appropriate."

3) "Based on a continuing review and evaluation of all pertinent facts and studies, and subject to review by the Chief of Naval Operations, to develop and promulgate as of a fixed date each year a statement of long-range Navy objectives extending through approximately 15 years in the future, comprising, together with an indication of relative urgencies or priorities and requisite balance in each case:

a. Naval weapons to be developed

b. Naval forces to be maintained

c. Naval warfare techniques to be introduced

d. Naval strategic applications to be sought

4) "To make such special long-range studies as may from time to time be directed by the Chief of Naval Operations."

The Navy handles its JCS and combined support activities on a narrow basis as we now do. Responsibility for staffing the JCS Agenda is centralized in one office. Plans and not Operations (O-3) process J-3 papers.

Naval officers with whom this has been discussed, all feel that the JCS agenda workload is such that a broader base is indicated. They point out that with all actions going through one or two planners, all they get is the opinion of those few as to Naval policy. "What is gained by the idea that any JCS subject has policy implications, and must funnel through plans, is increasingly offset by the narrow viewpoint, and lack of thinking time, etc., associated with this procedure."

THIS PAGE IS DECLASSIFIED IAW EO 13526

SECTION V

PROPOSED AIR STAFF ACTIONS AND ORGANIZATIONAL CHANGES

There is no perfect organization for any purpose. Most organizations can produce any desired results if the objective is agreed and a willing desire exists. Where a change in the orientation of the staff effort seems indicated, however, it can best be achieved through adjustments to the organization designed to emphasize the direction the effort is henceforth to take.

The fact that our present Air Staff organization CAN fulfill the requirements set forth in this study does not mean that it WILL do so even if directed. This is illustrated by the relative lack of action taken on the Vice Chief's Directive quoted on the cover of this paper.

Objectives of Reorganization

The primary goal of this proposed reorganization is to give greater emphasis to keeping Air Force policies, concepts, and programs in consonance with technological progress, and provide a staff structure capable of doing this. This requires:

a. First, that we mount an adequate R&D effort within the Air Staff in the "soft" areas of concepts, policies and objectives, and (see Incl A)

b. Second, that our staff organization and procedures take into account the fact that major changes in USAF concepts, policies, and objectives, suggested now or by the increased R&D effort, cannot be effectively processed through normal channels.

A secondary goal of the proposed reorganization is to provide a better and more effective means of disseminating, within the Air Force, the concepts, policies, and objectives developed and processed as a result of the primary goal.

Why Dissemination is Important

In the past, when most decisions affecting the nature of a military service were made by the Commander of that service it was only necessary that the Commander have all the facts made available to him, understand the problem, and direct appropriate action.

Today, when most decisions of substance, affecting the future of a service, are made by non-military authorities outside the service - and in a competitive atmosphere - it is necessary not only that these authorities have the facts presented to them and understand the problem, but also that they sense general Congressional and popular support for their decisions and the actions they direct.

Thus, to the extent that non-military authorities assumed increased power of decision in military matters since WW II, there has been a tendency to substitute the committee, mass movement, or "Gallup Poll" approach for that of command decision based on the individual knowledge and experience of the leaders. This in turn obliges those services seeking decisions to also seek a broader understanding of their aims and desires than was necessary for the past.

It is not the purpose of this study to discuss whether or not the above trends in defense decision making are or are not sound. The fact of concern to us in this analysis is that the unilateral power of the Chief of Staff to control the fate of his service is vanishing, and that as a result military views, if they are to prevail, must now be "sold" in the competitive JCS, OSD, or Executive markets, all of which are greatly influenced by public and political factors.

If the Air Force is to compete in this new environment we have no alternative other than to firm up our objectives as far in advance as possible, and seek to obtain support for them on the broadest possible front, as well as through normal channels. This in turn calls for a common position on, and a general understanding of, the basic issues and objectives of interest to us, and the preparation and dissemination of adequate "in house" guidance.

Alternative Possibilities

Today, the Air Staff is organized and oriented almost wholly toward dealing with current problems and processing the Air Force views on these through normal staff and government channels and standard "coordinating" procedures. There is also little emphasis on disseminating planning and policy matters since those in AFXPD who establish the position have neither the time nor organization to disseminate it, this being left to SAFIS or AFXAC, who lack the authority to oblige AFXPD to develop it for their purposes.

If we are to meet all the requirements set forth in this study, the entire Air Staff must recognize the need for a major R&D effort in the conceptual, policy, and objective area. New staff procedures for processing the findings of this effort must be devised and greater emphasis must be given to the dissemination of the approved findings.

There appear to be three practical solutions to meeting this requirement from the point of view of staff responsibility and organization.

FIRST, create either a new DCS or Assistant Chief of Staff, (Navy solution) to discharge the R&D and dissemination functions. This solution would disrupt the existing organization the least, and is the only one that really solves the processing problem. The new office would to some extent cut across both DCS/P and DCS/D responsibilities.

SECOND, meet the new requirement entirely from within DCS/Plans and Programs (AFXDC). This would require a sizable increase in Plans personnel and a concurrent decrease in the current day-to-day JCS support activities as necessary to allow the Deputy Chief of Staff, and Directors, concerned to devote equal time to the "R&D" and the "Maintenance and Modification" efforts. It fails to solve the processing problem.

THIRD, reorganize the Directorate of Plans so as to give increased emphasis to conceptual and policy research and development. This would require an increase in Plans personnel and a concurrent decrease in JCS support activities to allow the Director of Plans to devote equal time to the R&D and JCS "maintenance" efforts. It fails to solve the processing or dissemination problems in Section II.

It has also been suggested that we assign the conceptual, policy, and objective R&D function to DCS/Development (AFDDC). This would require a sizable increase within AFDDC. It would have the advantage of grouping technical and "soft" area research in one staff area, but would tend to complicate relationships between DCS/P&P and DCS/D. It would also separate development from dissemination to the detriment of the latter.

Recognizing that the very resistance to change discussed in this study will operate against its recommendations, and that there are different though equally valid solutions that would meet the new requirement, the following proposals for organizational changes in the Air Staff are presented as alternative possibilities:

THIS PAGE IS DECLASSIFIED IAW EO 13526

A Full Solution - Chief of Staff Level (AFCCS)

The prospects of getting sound new policies, concepts and objectives, command action, and effective dissemination will vary directly with the recognition given to the R&D effort in this field, and the level at which it reports.

This suggests that the optimum solution is to create a new and separate Assistant Chief of Staff (or DCS) for Long-Range Concepts, Policies and Objectives, (AFCLR) - (Navy approach)This is the quickest way for this effort to get the command and staff level of recognition necessary to initially "get off the ground."

Under this solution, the new ACS (or DCS) would be provided with a research staff of military planners, preferably located outside of Washington. His Pentagon activities would concentrate on presentation, processing, and dissemination.

The "field" office of AFCLR is envisioned as a small-scale effort that would hold roughly the same relationship to AFCLR and the Air University as is now the case between BMD-ARDC & AFCGM. Consideration should be given to creating this activity out of the present doctrine and strategic studies sections of the Institute for Research Studies at the Air University. (Old Evaluation Group)

Locating the main staff research effort outside Washington is recommended in order to prevent the highly qualified staff envisioned from being drafted to work on current problems. This will also reduce conflict between this group and current Plans activities, and permit the Office of the new AFCLR to remain small.

Under this solution the Assistant for Policy Coordination (AFXAC), now in DCS/P&P should be transferred to the new office of the Assistant Chief of Staff for Long Range Objectives (AFCLR)), complete with staff and mission. In addition, those elements of AFXPD now employed on research and staff studies relating to future concepts, roles, missions, etc., should be transferred to either the Pentagon or field staff of the new AFCLR, as appropriate.

The position envisaged for AFCLR in the staff structure is indicated on the chart, Inclosure C.

This solution does not preclude placing the staffing of current Joint and National affairs on a broader basis within the Air Staff as recommended and for the reasons

THIS PAGE IS DECLASSIFIED IAW EO 13526

discussed in Section III, Page 12, Processing Current Actions. On the other hand, it does not require that this be done as is the case in the "Partial Solution" discussed below.

A Partial Solution - DCS/Plans and Programs Level (AFXDC)

If it is considered that the responsibility for an adequate conceptual and objective research, development and dissemination program should remain within AFXDC, most of the requirements of this study can be met provided major adjustments are made within the AFXDC organization.

First, the long-range "in house" research and dissemination effort must come together with the current JCS support effort at a level that can devote approximately equal time to both activities. This means that the efforts should focus at the DCS/P&P level, and that some of the DCS/P&P's current JCS support responsibilities should be decentralized in order to permit him to devote more time to internal Air Force planning and guidance dissemination.

The Office for Long-Range Objectives in AFXPD, was originally set up to develop and disseminate the long-range "in house" planning guidance required by the Air Force. In practice, AFXPD-LR has not been able to meet the requirements to the extent set forth in Section II of this study for several reasons, principal among these being:

a. Inadequate staff to conduct a comprehensive research effort in the concepts, objectives and policies that govern the future of air-power.

b. The need to conform to classical staff coordination policies to an extent that prevents submitting to the command echelon, on a continuing basis, substantive recommendations involving changes in Air Force policies, concepts, roles, objectives, etc.

c. The second priority nature of the effort when competing for time, or personnel, with requirements to meet JCS agenda briefs and related current activities in AFXDC.

d. The inherent conflict between anyone charged with "Maintenance and Modification" of currently approved policies, concepts, objectives, and those who seek to change these - and the dominant position of the former within the AFXDC organization.

Recognition of the increasing need to disseminate USAF views, and to present a common front on vital issues led to the establishment, in January 1958, of the Assistant for Policy Coordination (AFXAC). This office, however, has found its task greatly impeded by lack of agreed "in house" objectives. When we don't know what we want, or can't agree as to what we believe in, on conceptual or policy issues, there is nothing on which to build a common front. This results in AFXAC often providing guidance based on personal views within the office, augmented by such hearsay as can be collected here and there in the staff, for lack of a carefully developed and approved USAF position.

Today, our long-range guidance tends to reiterate present concepts, only in the future tense. (See most AFOS papers). Since we already have today's concepts and policies in being the only valid objective under the circumstances is to keep them, and this can hardly justify a major dissemination and policy coordination effort. "We don't need a sales department unless we have something to sell."

If the requirements set forth in Section II of this study are to be met within AFXDC the effort must now be more evenly divided as between current JCS support work and the objective development and dissemination effort.

If equal time is to be given to the two efforts, Plans and Programs will in turn have to decentralize some of its JCS support responsibilities to other major staff divisions. This is recommended for reasons set forth in Section III, page 12.

Alternatively, or in addition, the Programs Directorate could be transferred to DCS/Operations (AFODC), thus further reducing the burden on the DCS/P&P to make room for increased effort in the R&D dissemination field. This having been done, AFXDC should then be reorganized into two directorates:

__. A Directorate of Joint and War Plans, (AFXPD) with staff and terms of reference as now established for the Assistant Director for War Plans and the Assistant Director for Policy.

__. A new Directorate for Air Force Plans and Objectives (AFXPO) with staff and responsibilities discussed below.

The new Directorate of Air Force Plans and Objectives (AFXPO) would absorb the present Long-Range Objectives Group (AFXPD-LR); the Office of the Assistant for Policy Coordination (AFXAC); and some elements of the Air Force Plans Division (AFXPD-AF).

This new Directorate would take over responsibility for all staff studies, and internal guidance development, including Objective Force and Long-Range Programming guidance, Weapons and Estimates Board activities, and other duties not related to processing current JCS and NSC agendas and plans, or supervising JCS activities.

The Directorate of Joint and War Plans (AFXPD) would absorb responsibility for Western Hemisphere Affairs (AFXWH) and the Office of the Assistant for NSC Affairs (AFXSC). This Directorate would, in effect, concentrate solely on presenting, and negotiating, the Air Force position in Joint, OSD, NSC or in Allied councils.

The line of demarkation that should divide responsibilities between the two directorates should be broadly that which separates "Maintenance, Minor Modification and Presentation of Current Air Force Policies, Concepts, and Positions", FROM "Research, Development, Processing and Dissemination of New and Future Air Force Policies, Concepts, and Positions."

The reason the above is termed a partial solution is that it does not fully solve the problem of processing change.

> By placing the R&D effort at DCS level, along with the maintenance function - as is now the case - the inevitable mutual coordination that will be required both between the two directorates within AFXDC, and as among DCS's overall, will continue to resist the presentation of major changes that now seem indicated if we are to get ahead of rising costs, politics and technology. Except for this shortcoming it is believed that this partial solution will meet the new requirements set forth in Section II.

Consideration should also be given in this solution to giving the Director of Air Force Plans and Objectives (AFXPO) direct control over the concept and doctrine activities of the Air University, Institute for Research Studies.

An organizational chart showing the proposed changes is attached, Inclosure D.

Minimal Solution - Directorate of Plans Level (AFXPD)

In the event reorganization at overall Air Staff level, as well as at AFXDC level, is considered impractical at this time, some progress can be made toward "getting on top" of the technological revolution and meeting some of the requirements of Section II above, by increasing our research effort within AFXPD.

The problem and recommended solution in this case is similar to that discussed in the partial solution proposed at DCS level. It requires that under the Director of Plans, the organization be relatively equally divided to meet the day-to-day JCS support function on the one hand, and the requirement for study, research and development of future Air Force concepts and policies on the other hand.

At present, AFXPD is divided primarily on the basis of the difference between Plans and Policy. Both subdivisions deal primarily with the processing of the current JCS agenda. Additionally, they attempt to study what Air Force future concepts and policies should be. The time and effort devoted to this latter task is limited to that left over after the former job is met. In the current environment of service conflict, technological revolution, and civilian control over detailed military matters, this organizational breakdown does not seem best suited to meeting the new requirements set forth in Section II above.

A more logical division of planning activities, to cope with the needs outlined in this study, would seem to be as between "maintenance" of the current Air Force position, AND "development" of the future Air Force position, placing all JCS, NSC, and Allied support activities in the former category.

For the above reasons, and those developed in the preceding solutions, it is recommended that, at minimum the organization of AFXPD be revised as follows:

__. Eliminate the office of Assistant Director for Policy, and consolidate his JCS agenda activities with those of War Plans.

__. Re-designate the Assistant Director for War Plans as Assistant Director for Joint and War Plans.

__. Create an Assistant Director for Air Force Plans and Objectives.

__. Integrate the office of Assistant for NSC Affairs into the Joint and War Plans staff.

__. Integrate into the office of Assistant for Air Force Plans and Objectives most of the present Air Force Plans Division (AFXPD-AF); the Long-Range Objectives Group (AFXPD-LR); and those elements of the present War Plans and Policy staff utilized to carry out staff studies, research and related tasks associated with attempts to develop future and internal Air Force positions.

The reason the above trend is termed a "minimal" solution is because it tends only to solve the requirement in Section II for additional research and study into future Air Force concepts, roles, and policies. It fails, on the other hand, to solve effectively the problems of processing the findings, or of disseminating these effectively. Also, there is little likelihood, in this solution that the Director of Plans, or the DCS/P&P, would be able to give "equal time" to the new effort any more than is now the case.

Consideration should also be given in this solution to assigning control over the Air University Institute for Research Studies' Concept and Doctrine Group activities to the Office of Assistant Director of Air Force Plans and Objectives, although it is doubtful if the Air University would consent to tie into the Air Staff at this level.

An organizational chart for this "minimal" solution is shown at Inclosure E.

Graphic Summary of Objective

The chart on the following page compares the R&D cycle in hardware with that in military science now and as proposed if the above reorganization is implemented. This shows graphically the inequality in the development of our two basic elements: our weapons, and how we use them.

0558

GRAPHIC SUMMARY OF R&D REQUIREMENT IN MILITARY SCIENCE

Phase	Military Hardware	Military Science — NOW	Military Science — NEEDED
R & D Phase I	Basic Research Applied Research	No organized effort at this time. Public speculation begins to create wrong impression of potential military worth.	Study of applications in wa and of impact on nature of war.
Engineering Phase II	Experimental Systems & Components	RAND & staff studies that add new weapons to current concepts with generally erroneous conclusions.	Development of optimum concepts, doctrine & organizations for use with new weapons systems.
Design Phase III	Design of System - Funding	Requirements established on classical factors. Costed & programmed, generally below requirements for lack of money	Requirements established in accordance with new concept: developed in Phase II above
Procurement Phase IV	Production	Tng for ops & maintenance | No tng on new concepts of employment	Tng for operation & maintenance | New concept: etc., teste & taught in schools
Operations Phase VI	Maintenance of Inventory	First effort by cmds to find new uses. R & D on tactics, doctrine etc. starts here. (Useful input to design phase of next system)	Operations, security policy, and war plans revised in light of new weapon/concept combined

THIS PAGE IS DECLASSIFIED IAW EO 13526

INCLOSURE A

ANALYSIS OF THE GROWING NEED TO EMPHASIZE RESEARCH AND DEVELOPMENT IN CONCEPTS AND POLICIES

The Nature of the New Requirement

The character of modern war is determined by two principal factors: "What" we can have to fight with -- our weapons; and "How" we propose to use these -- our concepts.

What we can have at any time stems from both technology, the state of the art, and cost which generally determines quantity if not quality.

How we use our weapons stems from either past experience in war, or objective study and analysis in peacetime.

Failure to fulfill long-range force programs and plans can generally be traced, in retrospect, to a failure to properly equate hardware, costs, concepts, in time and space, due to faulty estimates as to extent of change needed in one or more of these elements to obtain the optimum combination for an effective national defense.

This occurs, for instance, when we plan to use WW III weapons in accordance with WW II tactics and strategies; when we program general war forces, designed for long wars of attrition, in an era of short atomic conflicts; or if we assume that the targets selected for strategic bombers will also be the optimum targets for space delivery vehicles to attack.

Future military hardware is relatively predictable by comparison with future concepts. The weapons we can have at any time will depend on the emphasis given R&D. Except for unanticipated "breakthroughs", however, we can fairly accurately estimate the type and performance of the hardware we can hope to have for the next 10 to 15 years.

Changes in concepts, on the other hand, are not as easy to predict or to come by. While generally triggered off by changes in hardware, they originate in assumptions and opinions rather than in a projection of tangible tcehnical facts.

Since WW II the Air Force has devoted a major effort to technological progress. An equivalent effort, manpower and dollar-wise, has not been devoted to developing concepts designed to get the most returns from the new material. As a result, there is a growing gap between the capabilities of atomic-missile-space age weapon systems and our knowledge of how best to organize and apply these in war.

"The military, preferably led by the Air Force, must now strive to close the growing gap between progress in weapons and progress in adjusting concepts to the new weapons. This is the new requirement that faces our planners."

Why is This a New Requirement.

It is often argued that the requirement to update concepts between wars has always existed and been adequately met in the past; or else that there is no sound basis, other than war itself, for changing concepts.

It is true that the requirement for change has always existed, but, generally speaking, it has not been necessary to meet this requirement in peacetime for two reasons:

First, because in the past the comparatively limited progress in the development of new weapons did not make these entirely compatible with proven concepts, and;

Second, because the slow starting, long-drawn-out nature of past wars of attrition allowed for a period of test, learning, and readjustment at the onset.

For example, the Allied survived the Blitzkreig, and the Stuka concepts, at the start of WW II, because these new tactics, while effective, could not be decisive before we could develop countermeasures.

The above conditions no longer hold. Henceforth, the nation that waits for war to modernize its concepts in keeping with its weapons will be defeated. The short nature of atomic warfare precludes risking adjustments after D-day. In the future we will stand or fall on how well we are able to anticipate the need for change before the war starts. We can no longer afford the luxury of living with the truism that: "The military starts each war with the concepts and doctrines that won the last one."

Rapid progress in technology is now providing the military with radically new and different weapons, many of which are several generations removed from those that were tested in war. In the past all new weapons were tried out in each war, no matter how small. Nowadays, the fear of progression to general war has limited the

opportunity to test the more exotic developments in such limited conflicts as have occurred.

Thus, the opportunity to test conceptual, organizational, and tactical changes, as well as new weapons, under the relatively safe and controlled conditions of a small conflict, are few and far between. This means that henceforth concepts will have to be changed on the basis of peacetime calculations, war games and studies.

> The rapid turnover in new weapons, and lack of wars in which to test the effects of these on concepts, coupled with the decisive nature of initial operations creates a new situation in which the military must face up to major conceptual changes in peacetime.

Why Costs Affect Concepts

Technological progress has caused a constant turnover in weapon systems. The increasing sophistication and performance of the systems brought about by this progress has led to increased costs per unit or weapon. At the moment, the dollar demands for achieving these force levels seem to make our choice either death by enemy explosion or economic self-destruction (RAND P-1658).

The cost of current bombers is about 1.5 to 2 times that of their immediate predecessor. The next generation of bombers will run two times the current bombers or three to four times those of 1950. Currently projected advanced fighters run two to three times their immediate predecessor. In the missile field, research and development has reached a multi-billion dollar figure, and a single wing of (6) ICBM's, when introduced into the active force, will have probably cost in the neighborhood of a billion dollars (RAND P-1658).

The unit cost of the average weapon, or system, has steadily increased. While the cost of labor is a factor, this is balanced out by an increase in the GNP and the resulting ability to pay more for defense. The rise we are interested in, therefore, is not that due to increased labor cost, but only that due to improvements in performance and to increased complexity.

The new need to revise our concepts in peacetime to conform to the dictates of atomic-missile-space age weapons, stems not only from technological progress and the decisive nature of the initial phase of future wars, but also from peacetime economic considerations. We cannot afford to

constantly program costly new weapons in the quantities demanded by obsolete concepts. The effects of trying to do this to date are clear:

__. In recent years nearly all long-range force programs have been extremely unstable. U. S., NATO, and other allied force goals have been approved repeatedly, and yet never achieved. These goals have been invariably revised downwards, as their target date approached and generally in light of financial considerations.

__. We are all familiar with the history of the 143-wing program, and the Army's 24-division goals. In NATO, Lisbon goals were never achieved. MC-48 estimated capabilities -- not goals -- were never realized. There is little prospect of ever achieving the MC-70 minimum forces, notwithstanding pronouncements to the contrary.

__. At present, the cost of new weapon systems, coupled with economic limits, has so reduced the number of follow-on weapons programmed for our forces in the future that force availability is becoming increasingly incompatible with the classical strategy and concepts of our long-range plans (See Appendix G - The Decline of Follow-On Weapon Systems.)

__. The tendency to plan on new and more costly weapons in the same quantities as their predecessors, in the face of economic limitations, produces long-range programs that are seldom achieved in practice.

<u>Concepts Versus Quantity of Weapons</u>

The quantity of weapons and forces required to accomplish any given military task is influenced by the concepts under which the task is accomplished. Thus, any meaningful expression of the economic impact of future weapon systems requires that we take into account the concepts to be used since these largely determine the quantity required to accomplish the military task.

For example, a defense organization built around a new concept of the role tactical firepower can play in a land battle, could reduce force requirements to protect against

an attack from a fixed threat. The same holds for possible tradeoffs in air forces and target concepts with the advent of space or ICBM's.

The only exception to the above rule is where improved material performance allows the same job to be done with the same concepts, but with less equipment.

Generally speaking, however, if concepts and doctrines -- i.e., the ways in which the military task is accomplished -- remain constant in time, technological progress leads to spiralling costs to the extent, as indicated above, that these are not offset by cuts in quantity based solely on direct performance comparison.

Obviously, concepts cannot be rationally adjusted solely to accommodate cost. The selection of concepts must be based only on the military task to be accomplished in light of the capabilities and limitations of the means -- weapon system -- available to accomplish the task.

The basic problem, therefore, is to devise, insofar as humanly possible, planning procedures which allow us to change concepts in consonance with the concurrent changes in weapon systems, instead of assuming the latter provide only a better means of doing the same old job in the same old way. Our inability to adequately solve this problem is at the root of most current controversies.

> __. The quantity of forces and weapons required in any time-frame will be influenced as much by conceptual views as by the nature and size of the anticipated threat. As weapons change and costs per unit rise, concepts must also be changed.

The Cost, Weapon, Concept Cycle

The national military posture of major world powers has historically gone through a series of cycles due to the fact that technological advances in military material have invariably taken place at a steady pace, whereas the military concepts have generally remained CONSTANT over long periods of time, or were then changed only as a result of lessons learned in actual war.

Under ideal theoretical conditions, concepts should evolute gradually in keeping with the advent of new and more costly weapons.

Due to the fact that it takes longer to change people's ideas than to build equipment; that it is a human tendency to resist change in ideas; and that people are loathe to give up techniques which provided success in the past, the above evolution is never realized.

In recent years, when the cumulative amount of change in military material reaches a certain point, the military is obliged to go through an "agonizing reappraisal of its concepts in recognition of the obvious incompatibility of the old concepts and the new material." The new look was an example of this.

Although military logic demands that concepts and doctrines be henceforth changed in peacetime, and without benefit of test in war, it is economic considerations that have, in practice, forced the desired changes, wherever they have occurred between wars. A cycle is set up in which:

__. First, material changes steadily and costs go up, while quantity requirements -- based on fixed concepts and doctrines -- tend to remain constant.

__. Next, economic ceilings lead to force and weapon reductions; initially on the basis of improved performance alone.

__. Finally, the increased costs and new weapons are accommodated through an "agonizing re-appraisal" of concepts.

Generally speaking, the national defense establishment of a country is determined by the amount, and type, of forces deemed necessary to deal successfully with the threat to that country at any time. This has resulted in quantitative comparisons, following classical ideas of the importance of "mass" in military power.

Nations competing for a leading power position have normally sought to obtain the largest forces possible within existing economical and political constraints. It is probably correct to say that the search for maximum national security, under any given set of concepts, leads to maximum military expenditures commensurate with the economic possibilities of the nations concerned at the time.

Thus, a nation's relative military strength is generally determined by whether or not the quantity of forces and weapons available are increasing or decreasing vis-a-vis those of prospective enemies. The very fact that such a quantitative comparison is made from year to year is evidence

THIS PAGE IS DECLASSIFIED IAW EO 13526

in itself of the consistency of the concepts on which the utilization of both forces are premised.

Let us now introduce into this quantitative comparison the changing nature of weapon systems.

Technological progress is constantly producing new devices for the military. These have almost invariably been more complex, more exotic, and considerably more expensive than their predecessor. Thus, we find that as these new weapon systems are introduced, two things must occur.

a. Either the total national expenditures for defense will gradually rise; OR

b. The quantity of material and equipment, and of forces, deemed necessary to implement the established concepts and doctrines, it will go down.

If we study the past cycles, we find that both the above conditions have taken place in varying degrees.

There is initially an attempt on the part of the military to replace the obsolescent weapon systems with new ones on a one-for-one basis. This forces the defense budget up, but it can only go up so far if the nation is already carrying the maximum military expenditures that it considers it can afford economically and politically.

Since the economic and political constraints to increased spending do not change at the same rate as progress in new equipment, we thus find that there is generally a limit in the extent to which the country can absorb additional cost in order to allow the military to modernize its weapons on a one-for-one basis.

When defense funds are limited, the military has to choose between implementing its classical concepts, with less material and hence forces -- a course of action which is invariably interpreted as a reduction of the military posture and military power of the nation concerned, or developing new concepts under which less forces can do the same job as effectively. So long as technological advances continue, the above pressures will constantly be felt.

When the budget has reached a ceiling for the time period concerned, and when the military has absorbed all the reductions in quantity that they can rationalize without admitting a major degradation in national defense, then a reappraisal of concept

in light of the new equipment becomes the only means of maintaining the defense capability relatively constant.

Implications of the Cycle to USAF Planning

When the basic weapon - concept - cost cycle gets out of phase because one or more elements fail to vary properly with the others, we have an unstable planning and programming condition, excessive interservice differences, and waste and weakness in our defense posture. This is now the case.

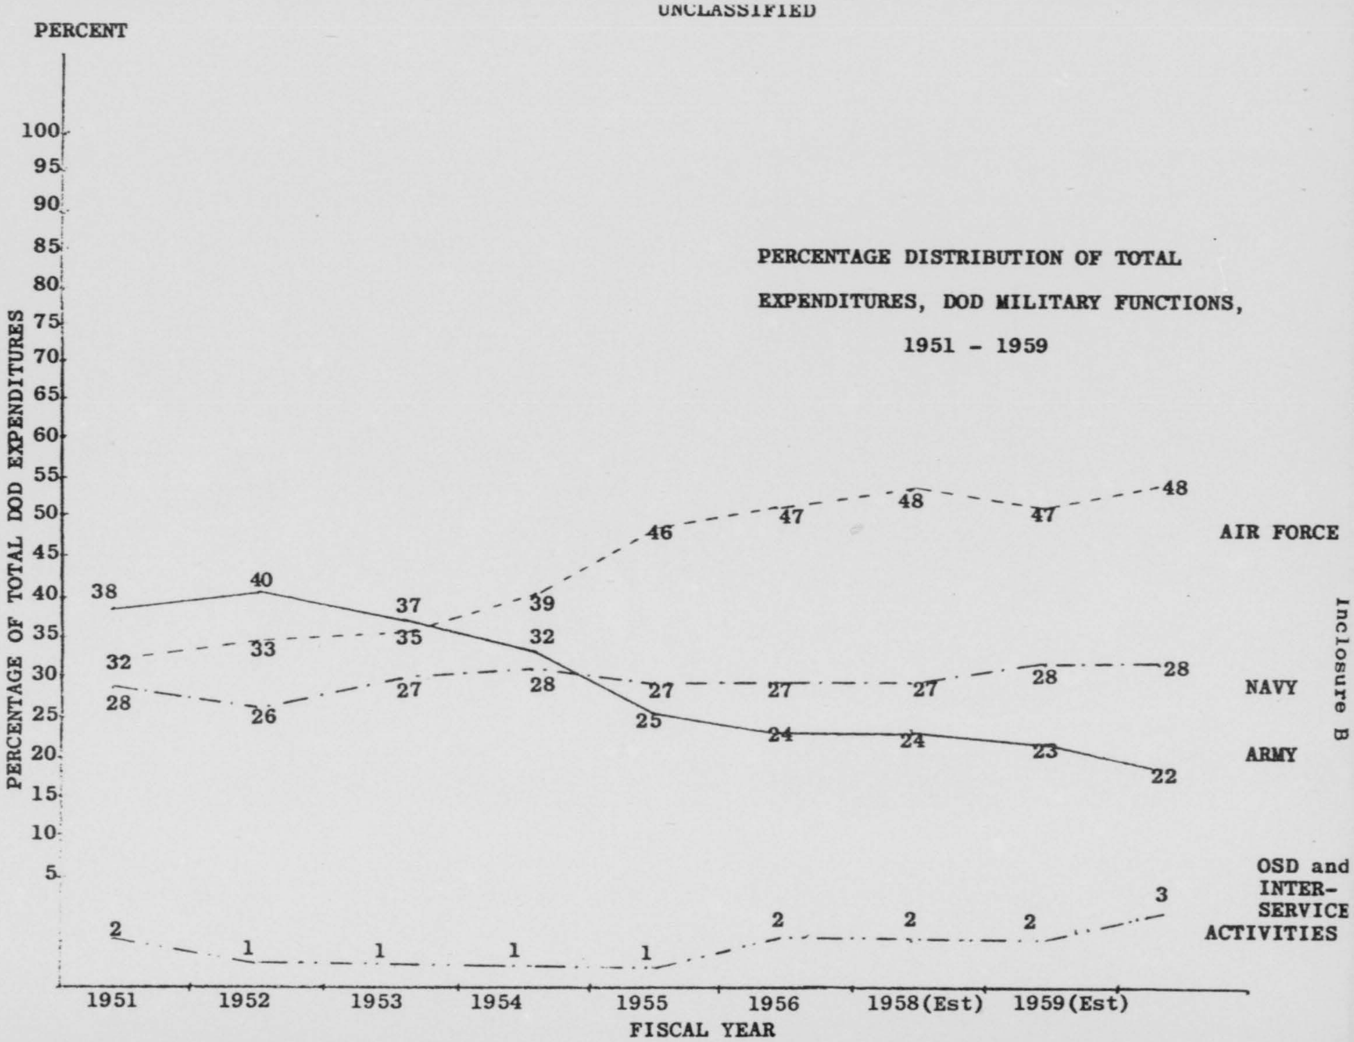
We must now establish an organization and planning procedures, which will allow us to seek out and implement new and different methods of achieving our military objectives, and in light of the new technological developments.

Adjustments in concepts to take full advantage of technological progress is the "key" to having modern weapons, with an effective defense, at an acceptable cost.

Conversely, adding new weapons to classical concepts, as is the tendency on the part of many, leads to more and more expenditures for a less and less effective defense.

It is also possible to deter aggression as a result of changes in concepts and the resulting inability of the aggressive nation to assess their full implications to the extent necessary to be sure that he has the power position required to initiate military operations.

Thus, an understanding of the role that changes in concepts -- the method of waging war -- plays in the cost and effectiveness of a defense effort in any time-frame, goes a long way toward explaining many of the current controversies over the adequacy of our defense effort. Specifically:



__. Those who wish to add the new weapons to classical methods of waging war, can show the current effort to be inadequate, particularly in land and sea forces since rising costs have resulted in a steady quantitative reduction of forces contrary to the classical idea of mass.

__. Those who understand the need to change concepts along with the advent of new weapons accept the new look force reductions as reasonable and proper in light of the changes in the nature of waf as they see it, and can even foresee more reductions.

The lack of past need to face change in "soft" areas has also led to a planning structure which is not necessarily best suited in proposing, processing, and obtaining decisions on changes required with sufficient lead-time to permit an orderly and economical transition to take place; i.e., we can decide to buy a B-70 six years in advance, but cannot discuss giving up a base, function, etc., until we are forced out or it is obviously worthless at the moment of decision.

The immediate problem is to devise a planning organization, and procedures, that can cope adequately with the new equipment to face up to substantive changes in concepts, tactics, organization, doctrine, etc., in peacetime -- as it now does in the case of the changes in weapon systems.

ANALYSIS

of the

IMPORTANCE OF OFFICIAL AND SEMI-OFFICIAL PUBLICATIONS

to

NATIONAL SECURITY

1. Military and naval journals have always had a vital though little recognized role in the formulation of sound national security policies.

2. Congress has recognized the need for publications in which professional military men could exchange views on tactics, concepts, doctrine and strategy and has authorized them to be prepared, published and distributed at government expense.

3. NATO has recognized this need and publishes the General Military Review which serves the same need on an international basis.

4. Recently there are some who question the usefulness of these publications on the grounds that they are merely used to challenge approved concepts of the administration, or alternatively, to stir up controversy. While differences of opinion obviously promote some controversy, this view of the purpose of these publications shows a lack of understanding of their true role in national defense.

5. New concepts, tactics, strategies, and doctrine must emerge if we are to realize the maximum benefit from our

THIS PAGE IS DECLASSIFIED IAW EO 13526

6 billion dollar yearly revision and development of weapon systems. These new ideas can only emerge if they are openly proposed and debated by the experts. The inherent resistance to change in the conceptual areas normally precludes the achievement of change as a result of a one-time study and formal proposal through channels.

6. As in the case of hardware, new ideas have to be evaluated and tested. Evaluation and tests of ideas, however, take place through the media of professional writings, public speeches, and open discussion. It is only in this way that all the considerations are brought to light and that eventually the sound ones obtain adequate acceptance and support to allow their formal adoption.

7. In the field of concept strategies and ideas, security is appropriate only as it applies to those that have been formally recognized and accepted. What should be classified is not the idea itself but rather the fact that it is the accepted idea and has been encoded in the formal policies or directives of the JCS, NSC etc.

8. Examples of the procedure by which new concepts are introduced are NATO and the Marshall Plan. These were debated in the foreign policy publications, proposed in public speeches, and tested and evaluated against public and expert opinion. Only when the findings were favorable were these ideas formalized as government proposals or positions.

THIS PAGE IS DECLASSIFIED IAW EO 13526

9. There appears to be a serious danger at present that, under the mistaken idea one is going to eliminate undesirable controversy, we will eliminate the ability of professional military persons to discuss and debate defense concepts, strategies, views, and doctrines. This could have very serious long-term effect on national security in that it would stymie thought in these areas by those most qualified to contribute, and this at a time when a proliferating technology demands a greater effort than ever before in researching concepts and strategies to exploit newly-emerging weapons.

10. There are other considerations here. Professional magazines supported at taxpayer expense would serve no useful purpose if they only reflected the views that were currently approved. In fact, this would be most dangerous since this would soon become known and would furnish a fantastic intelligence advantage to the enemy who could be confident that if it were approved in a professional magazine it was then the reflection of formal classified government policy.

11. It has never been easy to obtain writer support for professional magazines since there is no remuneration and little credit to the authors. If we additionally prevent the authors from expressing conflicting views in the more interesting areas of concepts, strategies and security policy (views which are likely their own views) we will probably kill off all support of these publications.

THIS PAGE IS DECLASSIFIED IAW EO 13526

12. The professional magazines furnish a vehicle by which the strategic and conceptual views of responsible commanders and planning staffs are circulated to the overall military population. If you deny these, the cross-pollination needed to develop valid service doctrine will be choked off. You would be required to set up a massive "in-house" distribution system to promulgate doctrine. Compounding the problem, this kind of doctrine would be "party line" and consequently far more dangerous than that developed via the normal route of free thought expressed in professional magazines, thought that can be accepted or rejected or commented on as the reader sees fit.

13. The same consideration as above applies with respect to our allies since many of these in the military look to our professional publications for U.S. ideas in tactics, doctrine and strategy even where these are contradictory. If you deny these views to them and to our Reserve components you will stymie intellectual capabilities on a broader-than-U.S. basis.

14. Unfortunately, the press of modern technology and the cost squeeze have generated a requirement for concepts and strategies compatible with the new weapons and the reality of modern economics. This search for concepts and strategies

THIS PAGE IS DECLASSIFIED IAW EO 13526

for the next decade, coupled with the fascination of the nuclear weapon development, has produced a large number of non-military authors with views on these subjects. Whereas the contribution of these civilian experts is unquestionably useful they must always be measured against professional expertise with regard to the actual implications in war of the adoption of any of these concepts and strategies.

15. If we deny the military the right to comment upon and challenge the views of professional writers and amateur strategists the country will come to look to non-military sources for guidance on basically military matters. This would defeat the entire purpose of developing military expertise by training in the service academies on through the war colleges. The only remaining educational requirements would be in the fields of logistics and management.

16. Lastly, it should be pointed out that there is little purpose in conducting National War College courses for senior military officers to study and debate national security matters and then attempt to confine their subsequent contributions in this area to managing resources. Even if you allowed them to make one-time, qualified academic strategic and conceptual contributions, they would have little or no prospect of being accepted by virtue of the lack of tests and evaluations discussed above. Furthermore, motivation would be stifled by the knowledge that their ideas would invariably be overruled by conflicting views posited by non-military authors given free rein to pronounce themselves on their favorite policies.

I. The Cost of Free World Defense

A brief discussion of the impact of cost associated with advanced technology, on national defense capabilities with emphasis on NATO.

II. The Planning Weapon Cost Concept Cycle in NATO

An analysis of the history of planning the defense of NATO to explain why there is a lack of consistency in force requirements and the need for flexibility.

THIS PAGE IS DECLASSIFIED IAW EO 13526

III. Analysis of the Atomic Problem

The problem of atomic vs. conventional warfare in NATO and a brief explanation of why a conventional conflict in that area is irrational and attempts to maintain forces for this purpose would be wasteful.

IV. Major Trends Affecting NATO Defense

1. The shift to general war and space.

2. Improvement in Allied capabilities vs. aid.

3. Trend to multilateral power.

4. SAC rejection, not withdrawal.

THIS PAGE IS DECLASSIFIED IAW EO 13526

V. The Impossibility of a Limited War in the NATO Area

A brief discussion of why we believe planning or preparing for a limited conflict with Soviet forces would not only be irrational but costly to the extent of bankruptcy.

VI. Air Force Force Plans and Programs for NATO.

What we see in the way of a U.S. air contribution in the near future in view of the above developments.

THIS PAGE IS DECLASSIFIED IAW EO 13526

VII. Air Force Force Programming Overall.

Show the current program to show clearly the relationship of changes in NATO forces to changes in other areas and the fact that NATO actually is suffering far less reductions.

VIII. The Problem of Missiles for NATO.

An analysis of SACEUR's proposal, the relative value of various missile systems, and a possible system for construction in Europe to meet the NATO requirement at minimum cost.

AN ANALYSIS OF LIMITATIONS ON CHOICE OF SECURITY CONCEPTS

AFXPD-LR

Our choice of national security policies for the next decade is influenced greatly by our past actions and by the existing domestic and international environment. It is academic and highly unrealistic to approach the question of free world defense concepts from a "pure" requirements point of view. A type of NATO alliance might have been desirable in 1935 to contain Hitler. In the international environment of that era, however, an international alliance structure like NATO would have had no chance of acceptance irrespective of its potential political-military activities. Likewise today, any realistic strategic concept must consider the international, political, enonomic, technological, and public opinion factors.

It may be generalized that the larger an organization, the greater would be the lead time required to gain acceptance of new concepts and to introduce new policies. This is even true where certain changes are easily identified and are clearly overdue. Organizational history is like a log floating down the river of time, or, in more modern terms, like a vehicle orbiting in space. To move either of these from their predestined courses requires the exertion of steady forces over long periods of time, or the sudden application of a single tremendous force. In the past, war was such a tremendous force and would provoke radical shifts in security policies and actions. On the other hand, steady forces are normally peacetime forces and must be geared to achieving minor changes rather slowly. Such minor changes must be in consonance with other demestic and international trends.

A Free World security concept for the next decade can be accepted and implemented only if it is designed to mesh with existing trends in all major areas of domestic and international security policy. Radical or reactionary

THIS PAGE IS DECLASSIFIED IAW EO 13526

proposals, even if objectivly desirable, may have little or no chance of success. New concepts must evolve smoothly out of old ones. Changes in the course of the "log" or in the "space vehicle" perhaps can be no more than a progressive exploitation of new technology. The "forces of evolution" frq-quently limit realistic planning to a choice of the least undesirable alternative course of action. In other words, it is often a choice among rotten apples, with no one alternative being very attractive.

Based upon a philosophy of "capabilities" rather than "pure requirements" planning, the following broad guidelines, or limitations, probably are controlling over the choice of broad security policies in the near future. Our concept for the Free World defense must be designed to take these into account. Any concept which ignores such considerations connot be realistically considered by the new Administration or our Free World allies.

POLITICAL TRENDS AND CONSTRAINTS

As Free World's national economies, military capabilities, and political stability continue to improve, national governments probably will be less and less willing to rely upon other countries for their principal security forces. As a result, during the next decade:

- The maintenance of U.S. overseas forces and bases will become more difficult and objectionable.
- In those countries which continue to accept U.S. forces and/or bases in their territories will demand increasing control over our use of these forces or facilities.
- Major allied nations will seek to develop more national or regional balance in their military defenses, particularily wherever their improved economies or new weapons permit.

- Allied nations will seek to obtain or to control a nuclear capability of some type for their own power, prestige, and possible use.

In light of these nationalistic tendencies and in appreciation of new long range missiles and aircraft (that permit either prompt military reinforcement in an emergency or support from a distance), the trend in mutual security alliances is properly toward increased combined planning, coordination of national plans, and the conduct of joint training exercises. This will be at the expense of large collective defense forces under international control in which we can anticipate a steady decrease in forces.

The strength of an alliance lies in its purpose and in the will of the members to act in concert under stated conditions. The mixing or pooling of forces may be actually an indication of weakness in an alliance since such mixing or pooling is normally done to offset lack of trust or local shortcomings in capabilities. The ideal alliance is one in which each nation would contribute a full share towards a common purpose under combined plans. The trend, therefore, away from overseas peacetime deployments need not detract from our Free World alliances. It could well strengthen them.

CONCLUSION

Politically, the Free World's security concept for the next decade should seek to increase combined planning, combined exercises, and standby Command structures while deemphasizing the peacetime integration of forces and great reliance on foreighn base structures.

ECONOMIC TRENDS AND CONSTRAINTS

The cost of weapons for war, and of military manpower, has been rising steadily since WW II. Some of this cost increase is due to inflation.

The greater share of increased costs, however, may be attributed to the increased capabilities and complexity of modern military hardware. This steady increase in costs will continue and must therefore be offset by either increased defense budgets, new concepts, and/or decreases in the quantity of forces and weapons.

Broadly speaking, Free World security policies and conecpts must always permit balance in what may be called the "Universal Security Equation:"

- What we do (our committments) PLUS -
- How we do it (our concepts and organizations) DETERMINES -
- the quantity of men and weapons needed, which multiplied by item costs must equal Total Defense Resources.

Thus, major changes in the item costs of men or weapon systems require adjustments either in concepts, committments or defense resources.

The rise in the cost of military manpower and weapons is a matter of record. There is nothing new to suggest the overall trend will change.

There are no real prospects of more than small annual increases, 2 to 3% maximum, in our defense budgets. The fact that the U.S. economy could afford more defense spending must be considered against the spending trends in other areas of Government activity. Historically, defense spending has been equalled or matched by government spending in other areas. There is no reason to expect that this relationship may change in the future, except that defense spending may be decreased.

The maximum increase we can realistically seek in U.S. defense spending, or by our Free World allies, will not approximate the amounts required to offset rising costs in modern military hardware. This being a characteristic of our times, it means that security policies in the next decade generally

THIS PAGE IS DECLASSIFIED IAW EO 13526

must accomodate decreases in committments, except where our committments can be equally satisfied by changing our concepts and organizations. This is the "how-we-do-it" factor in the Universal Security Equation.

We must also keep in mind that any increases in commitments, (such as greater limited war forces, etc.) plus any new commitments (such as space activities) add to the "multiplier" effect of the item cost element in the Universal Security Equation. This in turn will generate more frequent and drastic review of our concepts and commitments, and hence, of our overall security policies.

CONCLUSION

Economically, the Free World's Security Concept for the next decade should allow for decreases in quantities of forces and some commitments. New concepts must offset these decreases by exploiting the full capability of new weapons, space, and mobility concepts. A new concept must rely heavily on "quality" rather than on "quantity" of forces.

PUBLIC OPINION TRENDS AND CONSTRAINTS

Two trends in public opinion are of major concern to the selection of a modern Security concept. The first, that of the U.S. public, is the shift in general concern over the nature of the primary threat discussed previously in Section VI. The second, that of our allies, concerns their changing views toward existing Free World security concepts.

Following a discussion of the possibility of limited war in the NATO area, Henri Spaak in recent statement to the NATO Counsel made it quite clear that any concept which envisioned European territories ravaged again in an attempt to defend free world interests while the U.S. contributed only men and weapons was doomed to failure.

Again General Pierre Gallois of France, writing in "Strategy de 'age Nuclear", points out that the enlightened peoples of this generation will not risk their lieves and property in a defense effort which will clearly not provide them - not others - the security they seek. In plain language, no matter how much force is "in-being", European peoples cannot be expected to sacrifice themselves on an altar of preventing the extension of general nuclear war to other nations, principally the U.S.

Great citizen armies who fought and died as directed by their political masters, without questioning if the costs really warranted the risks, are to-day but possibilities for historians to contemplate. In the future, the costs of war will have to warrant the risks in the views of all people and nations concerned.

In past wars, limitations on range of weapons, or in target accessability, left no choice but to fight along the frontiers of freedom. Today, the global access confered by strategic aircraft, ICBM's and space vehicles permits the principal antagonists to engage each other directly, with the peripheral or frontier nations being by-passed in the quest for victory or obliterated in the process. The people in these peripheral countries understand these possibilities and will henseforth insist on the principle of "all or nothing". Any security concept which Free World nations on the Soviet periphery to the status of pawns which may be swept off the board to protect the "queen" for the "good" of humanity is doomed to failure!

CONCLUSION

A Free World Security concept for the next decade must first satisfy the growing U.S. public desire for adequate ICBM and space defense before providing for perpheral defense. The first line of defense of our country is NO longer in NATO or SEATO as it has been in the past. It is now here at home, in Russia, and in Space.

The enlightened peoples of most pheripheral countries are not likely to defend the Free World on their soil (even if the U.S. supplied the forces and weapons) unless all Free World means are committed concurrently and risked on their behalf.

ON TECHNOLOGICAL TRENDS AND CONSTRAINTS

Military technology is perhaps the principal factor that conditions change in free world security concepts. The advent of new weapons greatly changes the scope and nature of the threat. New concepts are required to respond to new threats and to exploit the full potentialities of new weapons. Thus, a complicated interrelationship is set up in which the principal security problem of all Free World nations is to keep concepts and weapons capabilities in phase. This must be accomplished in an environment in which weapons change constantly and easily while concepts tend to remain constant and are changed only with great difficulty.

Technological progress spawned the ICBM and led to the public attitude factors discussed above and in Section VI.

Technological progress is creating the "Nth Country" atomic problem and underscores the emphasis we are now placing on survivability.

Technological progress is responsible for the major portion at the increase in defense costs which in turn provokes continuous review of commitments and concepts.

One characteristic of technological progress that has had historically the greatest impact on defense concepts and force and weapon needs is "access-ability". Each time new vehicles have given nations greater access to their friends and enemies, for war or peace, changes in security concepts have followed.

THIS PAGE IS DECLASSIFIED IAW EO 13526

In the days when naval power was dominant in international affairs its owner was insured "access" to the ports, economies, and resources. The same naval power could also be used to deny other countries access to foreign ports and trade. The nation that controlled the seas by naval power dominated the world. That is clearly the history of England.

In more recent years, airpower replaced seapower as a decisive element of military strength. Why? The aircraft had greater "access" than ships. The aircraft granted "access" not only to the sea and to ports, but also to the hinterland of all land masses. We have lived in an era in which airpower has developed the capacity to grant or deny access to any spot on earth.

With the advent of the ICBM and of Strategic bombers that enjoy global ranges, Russia acquired true access to the hunterland of the U.S. and vice versa. This triggered off some of the pressures for conceptional change we have already discussed.

Likewise, space vehicles as they are added to the military inventory in the next decade will give their owners access not only to land, sea, and air but also to other spacecraft and space bodies. Space will be the new "high ground" of the mid and late Sixties. Even now, the psychological impact of this trend is noted in Europe where people is some areas look upon Soviet progress in space much as the soldier used to look upon an enemy holding a ridge and dominating the battlefield. It portends a power of invincibility.

While all technological facts and possibilities must be considered in the choice of a new Free World Security Concept, the principal technological developments of the next ten years are nuclear weapons, long range ballistic missiles, and space surveillance systems. A valid concept must consider fully these major technological advances.

Although nuclear development is well know, its impact on national defense and on the nature of and requirements for war are far from universally understood. In a broad approach to a new Security concept, the main nuclear trends and constraints we must consider are:

- Loss of U.S. capability to wage a sustained general or major, limited conventional war.
- Likely loss of U.S. capacity to fight small limited wars or major police actions without resorting to nuclear devices.
- The impossibility of recovering a non-nuclear capability of consequence in the present or future political, economic, military, and technological environment.
- The refusal of U.S. Congress to endorse U.S. provision of nuclear weapons to other countries in peacetime.
- The general fear of nuclear war by people on both sides of the Iron Curtain - will reinforce the deterrent power of a nuclear capability.
- The full benefits of a nuclear strategy will be hard to acquire, as has been the case in NATO, because national leaders do not fully understand nuclear warfare.
- The existance of the U. K. and French nuclear capability, and the likely entrance of other countries in the nuclear club.

CONCLUSION

The advent of the Ballistic Missile era has placed a high premium on security policies that do not depend on intercepting an attack after it has been launched.

The global range of ICBM's permits global deployment to achieve maximum dispersion and survivability. The lack of a recall possibility, coupled with short flight time, demands increased expenditures for hardening or mobility with an attendant reduction in funds for other purposes.

A salient factor in the ICBM development, from the point of view of free world Security, is the relatively low unit cost of second generation ICBM's in mass production (or after the major R & D costs have been retired). If the atomic development gave us a bigger bang for a buck, the ballistic missile will allow us to toss the big bang much further and faster for far less costs than bombers. An important element, of course, is the availability of ICBM's in useful quantities at costs allied governments can afford.

LIMITED/CONVENTIONAL WAR WITH THE USSR

64139-14

NOT A POSITION PAPER - TALKING PAPER ONLY
AFXPD-LR
15 November 1960

LIMITED/CONVENTIONAL WAR WITH THE USSR?

General Discussion

1. Recent study actions have diverted Free World thinking toward equipping for "limited war" with the Soviet Union.

2. The Air Force appears to stand alone opposed to this idea. We consider it to be one of the most dangerous trends in recent military history.

3. The issue, simply stated, is whether or not the United States should adopt a military strategy and design a force which--together with our Allies--will be adequate to engage Soviet forces in a non-nuclear, classical war of attrition. In other words, should we return to an ability to fight World War II or Korea-type wars with the USSR? Alternate terminology used by "limited war" disciples includes "conventional war". "Minimum deterrence" is an essential accompanying argument.

The Cost Factor

4. It should be clear from the outset that cost is a major factor in this problem. Some talk as if the advantages of the armed forces' New Look will remain if and when we return to conventional warfare. The overwhelming Soviet manpower advantage forced us into the New Look in 1953. At that time we low-keyed conventional arms and equalized the manpower imbalance with nuclear weapons. Having done that, having gotten the bonus of manpower savings, we are now pressed to return to conventional arms and somehow retain all the advantages accruing from the New Look. This prestidigitation is never explained.

5. Another piece of unexplained magic accompanying this argument is the "dual-capable" forces argument. This calls for equipping the forces with both conventional and nuclear artillery and missile weapons so that commanders will have the option of reverting to nuclear warfare if conventional

arms fail to hold the line. The unexplained part is how one contains a limited war while nuclear warheads are being hurled as far as 1000 to 1500 miles into the enemy heartland.

6. Those who call for a return to an ability to fight large conventional limited wars assume that this is as vital to national security as our need to maintain a recognizable and believed-by-all ability to win a general nuclear war or to get a real military capability in space. The truth of the matter is that as the support for the one goes up the support for the other goes down. Rationalizing the need for the limited strategy has led to the minimum deterrence idea. That is: something less than an ability to win a nuclear war will deter the Soviets. In other words, we pay for this new limited war capability out of the strategic capability.

Abandonment of Deterrence

7. If the Free World adopts this limited war concept in designing and employing its military forces, it will have abandoned the kind of tested deterrence that for fifteen years has forced the Soviets into cold war tactics because they could not be certain of controlling the weapons or the intensity of a hot war.

8. This kind of thinking has already made its mark on Allied resolve to resist Communist global aggression. Further action along these lines would destroy the credibility of Allied response to aggression and it would invite the USSR to consider the relative advantages of limited warfare as an additional means of hurrying history along its course.

9. The impact of such a decision on the Khrushchev-Mao coexistence-versus-war debate, for example, could be to stoke the fires for Mao's case. No longer threatened by nuclear attack on the USSR's war-making potential, Khrushchev's hold on Mao would be significantly weakened.

Air Force View of Free World Strategy

10. The Air Force believes that United States military strategy should deny the Communists a flexibility of alternatives, not increase them. We should seek to find ways to restrict Communist options, not seek ways in which to allow them to turn cold war into hot war.

THIS PAGE IS DECLASSIFIED IAW EO 13526

11. If we fail to build this kind of strategy, the Soviets will be able to challenge us on their terms, at times of their choosing. And they will not risk the survival of their society and their heartland by a military venture.

Strategy Must be Responsive to National Policy

12. Our military strategy is designed to deter war, if possible. Implicit in this strategy is the thought that an ability to win a war is the substance of deterrence. For, failing to deter, our strategy calls for an ability to win the war that results. If our strategy is to remain responsive to national policy, we must prevent the substance of deterrence from being vitiated by the adoption of a weaker strategy that announces that limited military containment is acceptable to the United States.

Incidents Possible

13. The possibility of military incidents, incursions, and exploratory maneuvers is ever-present. This includes possible momentary confrontations of minor military elements of United States and the USSR. But these situations must be given the criticality they deserve.- decisions must be made in light of the particular circumstances. This kind of action must not occur as part of a strategy that invites "limited" or conventional engagements with USSR forces.

Handling Limited Engagements

14. The Air Force advocates and supports revitalization and modernization of mobile, well-equipped "conventional-type" forces. These forces contribute materially to our overall deterrent posture. They are ideal for quick and positive reaction to the threat of limited military aggression or to back up Allied reaction.

15. Operating under the umbrella of demonstrable war-winning strategic forces, this kind of fast reaction force acts as an operating deterrent to the use of force in local conflict. It can be employed rapidly to establish the fact of military aggression, to suppress it, or to identify the level of decision required.

THIS PAGE IS DECLASSIFIED IAW EO 13526

16. But the Air Force opposes the idea that United States strategy should be designed to provide forces and weapons for sustained or repeated limited engagement with the USSR. For the reasons outlined above, this limited strategy against a total enemy is a losing strategy.

LIMITED WARS AND THE RELATIONSHIP BETWEEN
MANPOWER AND FIREPOWER IN ATOMIC WARFARE

6-A139-15

THIS PAGE IS DECLASSIFIED IAW EO 13526

AFXPD-LR

LIMITED WARS

and the

RELATIONSHIP BETWEEN MANPOWER AND FIREPOWER

IN ATOMIC WARFARE

I. MANPOWER vs FIREPOWER

1. The objective of this paper is to obtain general understanding, and appropriate application of the principles

a. That in wars where atomic munitions are employed, firepower becomes both the dominant and decisive factor. All other forces must be designed to maximize the ability to deliver it, and successfully absorb it;

b. That whereas the principle of mass remains valid, it will henceforth be measured in terms of kilotons and/or megatons applied in the battle and NOT in terms of quantities of manpower or delivery vehicles, and that

c. These changes in the impact of weapons on warfare mean that local aggression can be effectively interdicted by a small defensive force supported by tactical nuclear firepower suitably deployed,

2. General Twining stated in a speech in 1956 to the National War College that: "In future atomic wars mass will be measured in kilotons and not in terms of manpower."

3. Speaking to the NWC in 1955, Field Marshal Viscount Montgomery, Deputy SACEUR, stated:

"We came to the conclusions we could only do that (hold forward in Europe) by using the nuclear weapon and going in for a policy of destruction with that

THIS PAGE IS DECLASSIFIED IAW EO 13526

weapon -- the nuclear weapon having a great capability for destruction on an area basis -- and we therefore used as our chief agent the nuclear weapon and we used the forces to support the weapon. Now that is a reversal of previous thinking. In past thinking it was the weapon which disrupted and weakened the enemy and then the forces moved in to complete the business. And I think the difference in the tactical concomitant of nuclear warfare is a very important matter to put right. You use the nuclear weapon for your offensive punch and not human bodies in the first instance."

4. The above pronouncements stem from recognition, by students of strategy and tactics, that the area destructive capability inherent in atomic munitions means that firepower and destruction will henceforth be the decisive elements in atomic age war. Atomic destruction will be the end-all of the battle, as such it replaces past emphasis on counter attack and maneuver, by men and materiel, to achieve the ultimate objectives.

5. Where, in the past, artillery (missiles) and air forces had a supporting role, in the future, firepower, and hence these means of delivering it, will have the dominant role. This was already evident to a degree by the influence of strategic air in WW II. This decisive influence has now extended on down to all means of delivering atomic destruction.

6. With the advent of atomic weapons, the target's ability to absorb attack and survive has been greatly reduced. Conversely,

the atomic weapon with its large lethal area, has tremendously increased the ability to destroy. In past wars the probability of destroying a target with any given bomb or shell was, relatively speaking, small since each such target has to be pin-pointed and hit. Random fire, while producing some kills and disruption, was not decisive due to the fact that there was invariably more vacant space in relation to the area destroyed that space occupied by objectives worth destroying. When the lethal area of one weapon is increased to the extent of providing a greater probability of a kill than of a miss against any given target complex, the dominant role clearly shifts from quantity of forces to the firepower or destructive agent.

7. The changeover from the case where weapons support the forces, to where forces support the weapons, occurs when the probability of kills by a random shot exceeds the probability of misses. This occurs with the introduction of atomic munitions at any level where same can be used and effectively delivered. In future battles the forces will support the firepower and not the converse. The objective will be destruction instead of disruption, defeat, and ultimate capture.

8. The new role of firepower will have far-reaching effects on tactics and on force requirements for war. It appears to confer upon the defense a decided advantage over the offense in a fixed land battle. Conversely, it confers upon the air or missile offense a decided advantage over the defense by reducing the magnitude and frequency of the effort required to accomplish

0617

THIS PAGE IS DECLASSIFIED IAW EO 13526

the desired destruction. The classic principles of mass and mobility of forces must be reviewed. It brings into question the importance of manpower in assessing relative military strength. In this latter respect it is a principle which is of current and vital importance in view of the financial demands imposed by new weapons, missiles, and satellites and which may have to be obtained at some expense to the strength of peacetime forces.

THIS PAGE IS DECLASSIFIED IAW EO 13526

II. ON LIMITED ATOMIC WAR

Very little has been said or written on the use of nuclear weapons in limited wars. This is partly because there is a popular -- though wholly unsubstantiated -- opinion that any use of such weapons will result in a progression to general nuclear war, and partly because those most concerned resist the above conclusions and the resulting fact that very small land forces can effectively contain limited aggression anywhere if atomic weapons are used.

Limited tactical atomic counterforce leads to a theater level form of stalemate. When two forces face each other across a land front neither can successfully advance against the other until the opponent's atomic firepower has been dealt with. Since this is a factor in granting small forces the capability of defending themselves against invasion by an enemy with far greater manpower, air planners should understand this type of stalemate, particularly with respect to its deterrent prospects against limited war ventures.

In theory where two opposing forces face each other across a front or along a frontier, they can totally destroy each other's combat formations so long as they each have adequate and secure atomic stocks and delivery means. The constraints imposed by geography as to the length of any land front, plus the constraint imposed by mobility limitations on the depth to which invading or defending formations can be deployed and still influence the battle, when considered in relation to the area of primary

effects of atomic weapons in the megaton range, make such mutual annihilation a practical proposition.

Thus two conditions will ensure a stalemate or standoff in a limited aggression opposed with atomic firepower. On the one hand mutual suicide of forces is a practical proposition with high yield weapons. On the other hand the advantage conferred on the defense by the use of selective tactical atomic firepower can prevent invasion as long as the atomic fire support of the defender remains adequate and secure. In either case the frontier remains uncrossed. It follows from this that a successful invasion by limited military operations against an atomically defended frontier requires that the defender's atomic means first be destroyed or neutralized.

In a limited war situation, as in total war, the outcome depends on the relative effectivenes and security of atomic stocks and delivery means. Until these can be dealt with, by one side or the other, land forces cannot advance and occupy or conquer territory and the battle front remains frozen along the initial defense positions. This is a new situation which has an important effect on the probability of successful limited war.

If a stalemate will exist on land until the battle for local atomic supremacy can be resolved, the question of local air defense, and the vulnerability of delivery forces, both

THIS PAGE IS DECLASSIFIED IAW EO 13526

assume importance as in the case of strategic warfare. The atomic firepower can either be intercepted or destroyed at source. What are the prospects in both instances and how will they effect the likelihood of a tactical atomic stalemate either as a deterrent to limited aggression or as a deterrent to use of atomic weapons?

Air Defense in Forward Areas

In a limited war between adjacent forces and territories there is little or no depth available for warning and in which to intercept. The condition in the forward areas is generally fluid and the availability of large fixed warning and control radars cannot be counted upon. Finally, delivery ranges are short, hence missiles, artillery and aircraft with very limited flight time can be used. Under these circumstances the possibilities of defining a wholly effective local air or missile defense against an enemy's tactical atomic delivery capability are remote. It is about on a par with finding a way of preventing enemy artillery fire from penetrating into one's frontline formations. The only effective defense lies in destroying the enemy's atomic capability at source, and this, if and where it can be done, will ensure victory.

Vulnerability of Delivery Means

If one side could succeed in destroying the other's atomic delivery system at source it would then fall heir to a local atomic monopoly and could invade the territory of the other with

impunity and regardless of the strength of the defending forces. These latter would be systematically destroyed without risk of retaliation. The prospects of doing this, however, in a localized war are poor by virtue of the limited area of active conflict and resulting existence of sanctuaries from which the delivery force can operate.

The atomic delivery means required to support a limited war need not be deployed in the combat zone. Not only can they operate from sanctuary bases effectively but there is also precedent for this. In Korea the air striking power on both sides was based outside the area of limited war. Unlike the land combat formations, air forces and medium range missiles are by no means constrained to be along or near the front. Therefore, these are vulnerable in a limited war only if they are in the war zone, or if the contestants are willing and able to run them down outside the war zone.

The first alternative, to be decisive, would assume that one side would accept defeat before basing outside the theater. The other alternative, to pursue and attack them wherever they may be, must mean -- in this age of global range air power -- over the better part of the world. In this case the war would no longer be a limited one.

Thus:

The range of modern air power and missiles allows them to operate effectively from great distances and remote base areas.

THIS PAGE IS DECLASSIFIED IAW EO 13526

This permits nations engaged in limited wars to base their atomic delivery arm in areas secure from enemy attack unless the enemy is willing to risk enlarging the war.

Prospects for a Tactical Stalemate

An atomic stalemate condition has better prospects of occurring in a limited war than in total war. The aggressor has no change of successfully invading until he deals with the atomic delivery capability of the defender. Both sides can annihilate the other's forces in the combat zone but such a policy of "baby" mutual suicide accomplishes nothing in so far as the conquest of the territory is concerned.

Thus a would-be aggressor is deterred from a massive megaton attack against forces defending an area by knowing that this would lead to his forces suffering like damage, but he is deterred from selective atomic attack by the advantages conferred on the defense in this maneuver, and he is deterred from attacking the only objective which would break the stalemate -- the enemy's delivery force and weapons -- by the need to enlarge the conflict to total war in so doing. In summary:

In a war limited to a specific geographic area there is no prospect of effectively intercepting the delivery effort enroute to its target, and no prospect of destroying it at source -- where the source lies outside the area -- except by enlarging the combat area to include the delivery bases.

Since a successful advance by land forces against a defended area requires the prior destruction or neutralization of the delivery means, a stalemate or global war are the inevitable results of a limited war effort.

Importance of Prepared Defences

In the above conclusion we referred to a "defended area." By this is meant an area where ready defense forces and their atomic support are available and in or near their combat stations at the onset. The conclusion does not apply to the same extent where the act of aggression is not initially opposed. In this case the mutual atomic capabilities remain the same but the advantages conferred upon the defense by not being exposed while moving, or concentrated while attacking are lost. If the shield forces have to be built up after the onset they are as vulnerable to atomic destruction as are the aggression forces. Considering the relative effectiveness of atomic firepower in this situation, the tables are turned and, the aggressor is in reality defending the periphery of the area he wishes to conquer from invasion by the would-be defenders.

A stalemate condition, and hence effective deterrent, to a local act of aggression will occur only where there are some defending shield forces in position and ready at the onset, though these do not have to have an atomic capability of their own if they are supported by outside delivery forces - at sea or in sanctuary.

MUST ATOMIC WEAPONS BE USED

June 1960

MUST ATOMIC WEAPONS BE USED

The majority of contemporary writers on Foreign Policy argue that any use of atomic weapons in future wars will jeopardize the survival of our civilization. They then advocate the elimination of these weapons from the battle thru disarmament, international controls, or unilateral decision to refrain from their use.

Many different arguments are given us to why governments should refrain from using nuclear weapons in future wars. They all stem, however, from the questionable, though popular, assumption that any use of the atomic weapons will lead progressively to its unrestricted use in a total war; and they all tend to deal with only the desirability of avoiding use of these weapons. They have little or nothing to say about the practical feasibility of creating an effective defense while, at the same time, retaining a choice as to whether atomic weapons would or would not be used.

While our Foreign Policy writers have had much to say about the desirability of eliminating atomic weapons, our military writers have been strangely silent as to the feasibility of such actions. A cursory examination of the characteristics of existing and planned new weapon systems suggests, in fact, that the military considers the atomic weapon to be a permanent and indispensable arm of modern forces notwithstanding the many persuasive arguments for its elimination. Under present trends in the Defense organization and equipment of the major powers, a balanced land, sea, and air capability to fight a sustained limited, or general war, without using atomic weapons will probably no longer exist in the very near future, if indeed it exists today.

It is my intention in this article to examine the reasons behind the apparent conflict between the non-atomic defense currently advocated and the trend in military capabilities. Unless these trends can be reconciled, we risk wasting money on attempts to do the impossible, simply because it seems desirable. The result would then be a compromise military capability inadequate to wage conventional war, and easily defeated in atomic war. This would be the worst possible outcome, and therefore, one which we must clearly avoid.

The key to the question of whether or not atomic weapons will be used in future large or small wars seems to rest in an analysis of whether or not control over their use is a practical possibility within the constraints imposed by the need to protect the Free World from aggressive Communism. The question of whether their use is, or is not, militarily or economically desirable -- or even whether such will threaten the survival of civilization -- is clearly academic unless we can first agree that it is

possible for major powers to wage war effectively at any level while refraining from the use of the nuclear weapons which they possess.

I believe that an analysis of the feasibility of eliminating atomic weapons from war, or of controlling their use to any worthwhile degree, will show that the real choice lies between deterring war itself or using the new weapons rather than between a war with or without their use. Those who argue to eliminate atomic warfare are in fact arguing for the elimination of war, since the partial solution they seek at present -- a return to classical conventional combat -- is wholly unrealistic and this, for reasons largely beyond political control. Let us examine the facts from a practical military point of view.

Atomic Progression

The availability and threatened use of atomic munitions, during the past 13 years, has made certain fundamental changes both in weapon systems and in military science as a whole. These changes have occurred gradually, and to some extent imperceptibly, yet their overall affect has been to slowly draw the curtain of atomic inevitability over a steadily increasing percentage of the Defense establishments of all major atomic powers.

The rate at which military science and weapon design has changed to accommodate the new development has been geared to the steady increase in quantity and diversity of atomic munitions made available by technological progress. This suggests that the evolution is far from complete. The extent of the changes made in military science have been largely limited to date by the ability of the military to understand and adjust their ideas in consonance with the full impact of the new munitions. This suggests that our conventional capability may in fact be less real and more obsolete than apparent on the surface.

The atomic curtain enveloped strategic airpower in the mid 1940's. There was no spectacular decision -- merely the routine processes of military planning, force programming, and budget development. World War II proved that strategic air systems were a major factor in modern war. In 1946, simple arithmatic proved the impracticability of building bombers in sufficient quantity and with adequate performance to even start a "hard bomb" campaign against a country as vast and remote as Russia. The cost of the strategic requirement went up in direct ratio to the size and distance of the enemy target complex; to the increase in sophistication of the delivery systems needed to penetrate modern defense, and to progressive reduction in the forward base sites as our World War II Allies reverted to

peacetime status. The need to solve these problems led to the adoption of the inter-continental jet bomber, the supercarrier, and the atomic weapon. The atomic development made it possible to afford the new vehicles by cutting quantity of force in favor of quality. Following this trend, SAC and portions of the Naval air arm, slid further and further behind the atomic curtain with each new generation of weapon systems.

Although the strategic arm became wedded to nuclear warfare in the mid-1940's, first by the inability of nations to meet the quantitative requirements for strategic bombers for conventional use, and later by design and performance changes which emphasized atomic delivery needs, the rest of the forces retained their classical capability for several more years. This was due to the time it took to invent and build nuclear weapons in types and sizes suitable for other than strategic purposes and for use in other than large strategic vehicles. As new and improved atomic devices appeared, or were anticipated, the tenacles of the atomic curtain crept around other arms and defense formations.

Since 1950 no one has seriously questioned the fact that atomic weapons would be used in a world war. By 1954, NATO had announced that any attempt to invade Europe would be met with an atomic defense. On 21 October 1954, Field Marshal Montgomery, then Deputy Supreme Commander in Europe stated in a public speech: "I want to make it absolutely clear that we at SHAPE are basing all our planning on using atomic and thermo-nuclear weapons in our defense. With us it is no longer: 'they may possibly be used.' It is very definitely: 'they will be used if we are attacked.'"

By mid-1955 there seemed to be general recognition in military circles of the inevitable use of atomic weapons in any future wars of consequence; that is, wars involving balanced and sustained participation of land, sea, and air forces such as WW II or Korea. Obviously, guerrilla warfare and police scale actions, as was Lebanon, can be dealt with without atomic weapons; however, these do not qualify for purposes of this discussion as "wars of consequence" from a military point of view, since they do not call for the sustained use of major military formations from all three services nor for the full spectrum of combat undertakings such as land bombat, counter-air, interdiction of enemy forces, and control of sea bases.

Throughout the 1950's the diversity of our nuclear arsenal continued to increase. At the upper end of the spectrum the 15 Kiloton Hiroshima bomb of 6 August 1945 grew into the 20 megaton range of weapons tested at Bikini in 1954. At the lower end of the spectrum the large and voluminous Hiroshima weapon has been miniaturized to the extent that 280 mm atomic cannon shells were deployed in NATO by 1955 and in September 1958 the AEC announced a high altitude balloon weapon test of an atomic device delivering only a "fraction of a Kiloton."

It seems clear that the atomic development will soon close the gap between massive strategic destruction and the power and selectivity of non-nuclear bombs and shells. Eventually, the military can obtain a full range of destructive power, in single packages, -- one bullet to kill a man, one bomb to kill a city. The effects of this on force requirements for war are obvious. In the past there were individual targets that could only be destroyed by many trips by many vehicles manned and supported by many people. The same targets in future wars can, in most instances, be dealt with by one trip by one vehicle, hence the need to emphasize quality and performance over quantity of forces in all arms and services.

Whether desirable or not the evolution towards normalization of atomic warfare is a historical fact. The question now is can it be reversed or even arrested. The answer would seem to depend on what motivated the evolution in the first place. If it stemmed from the mere desire on the part of soldiers, sailors and airmen to use the new weapons, this could be controlled. Again, if it stems only from the orientation of technology and resulting availability of weapons, this trend could be changed. On the other hand, if the introduction of atomic weapons into all arms and services stems from the need to be prepared to defend against possible atomic aggression, and this need in turn can only be fulfilled at the expense of a major degradation in our conventional war waging capability, then we have an entirely different situation with respect to the possibility of preventing the use of these weapons in any war. I suggest that this is now the case.

There are in fact three by-products of the need to be prepared to defend against the possibility of an atomic attack, that combine to cause all nations to abandon more and more of their conventional war waging capability until the choice will soon lie between fighting with atomic weapons, or not fighting at all, and this regardless of who starts what.

a. First, is the increasing need to emphasize ready force and quick response in atomic age defenses which in turn complicates the problem of last minute control over the use of atomic weapons.

b. Second, is the need to adopt equipment, deployments, organizations, -- in short "force postures" that will allow our forces to survive in the event of an atomic attack. This requirement conflicts with the force concentrations called for under classical principles of war and which must be realized in order to mount a successful conventional defense, and

c. Finally, the cost and complexity of the sophisticated weapon systems required to insure successful delivery of atomic firepower precludes procurement of many of these systems in sufficient quantities, and with adequate mobilization back-up, to provide an effective sustained conventional war effort.

On Quick Response versus Controlled Use

There are some characteristics of atomic warfare on which military strategists are in almost unanimous agreement. Foremost among these is the fact that a conflict fought with atomic weapons will be of comparatively short duration, and the decisive phase will start with the onset of hostilities. This stems from the fact that the destructive power required to seek a decision is "on the shelf" at the start, and we now have global range delivery systems. We no longer have to build our weapons of destruction in quantity after D-Day, and mobilize and deploy forward so as to reach our principal targets, as we did in past wars. This fact alone telescopes the conflict by eliminating the classical "holding" and build-up phases.

One effect of this change in the duration of the decisive phase of war is to place almost all the responsibility for the outcome of a conflict on ready active forces. All services now agree to this as evidenced by the emphasis they place on their peacetime strength, deployment, and alert status. No one can afford to rely on post-D-Day actions to bring any of these up to acceptable standards. By the same token this means that any weapons, which the forces may have to use, must be ready, on hand, and in the combat formations on D-Day, and hence at all times before D-Day.

Thus, the very readiness forced upon us by the existence of atomic weapons in enemy hands demands that we make the new weapons available to more and more echelons of the forces, as the enemy threat and atomic delivery itself increases. The history of the case shows the trend. Early bombs were kept in A. E. C. stockpiles; force readiness later dictated on-base dispersal; a further increase in the alert status placed on SAC forces caused them to be placed overseas and then loaded in the aircraft; and, more recently, to be carried on airborne alert. Likewise, atomic artillery and Army missile units in the field would hardly be useful without their nuclear warheads. Navy carriers and Polaris submarines can hardly be expected to return to port for their atomic bombs, mines, and missiles; and now that they are available for air defense, the interceptor pilot can hardly ask the aircraft he has identified as hostile to stand by while he flies back for his weapon.

The ability to control the use of atomic weapons in an emergency will obviously vary inversely with the extent to which various echelons physically possess them. When a successful defense against an enemy's atomic attack demands that a nation's forces have constantly, at hand, at all levels the means of retaliating in kind, it is unrealistic to assume that some elements of the forces will not initiate their use, inadvertently or otherwise.

THIS PAGE IS DECLASSIFIED IAW EO 13526

While those whose life is not in immediate jeopardy, can be expected to use discretion and await orders in this respect, all those engaged in active combat, and whose lives are at stake, can hardly be relied upon to meet the enemy with one hand voluntarily tied behind their back.

The initial use of any atomic device by either side, even in localized situations, would probably lead to widespread use by both sides - thus, if even one atomic anti-aircraft shell, or missile, or mine is fired the responsible nation is in the position of one who is just a "little bit" pregnant with respect to initiating atomic warfare.

The atomic munitions appear to be here to stay since we can't keep others from possessing it. As such, it poses a threat. Thus, the attacker and defender alike will always have to be ready to retaliate with atomic weapons regardless of their own intentions. This dictates the development of an atomic war capability throughout the forces. This requirement in turn, probably precludes truly effective control over the use of the weapons in the event of hostilities. I suggest that in this instance, the old saying that "the more people that know a secret, the less likely are the chances it will be kept" is valid with respect to the probability that atomic weapons will be used in an emergency. Our survival in the face of possible atomic attack demands we accept certain risks and this is one of them.

The important thing is that we don't fool ourselves with respect to the extent of control we are likely to have over the use of these weapons in war when many elements of the forces on both sides may find themselves faced with a choice of being defeated or using all weapons at hand to protect themselves.

Incompatibility with Force "Posture"

The inability to insure positive control over the use or non-use of nuclear weapons in a future emergency is not the only reason suggesting their inevitable use. The changes which must henceforth be made in the size, deployment, organization and equipment of the forces, in order to survive in an atmosphere of possible atomic war, will soon effect the ability of major powers to fight non-nuclear wars even if they could retain positive control over the decision. These changes are forced upon the Armed Forces, not by choice or economic considerations but solely by the fact that the enemy possesses an atomic capability.

The growing enemy atomic capability obliges the Free World to progressively adopt more and more measures to insure the survival of its forces, should atomic weapons be used against them. The very survival measures which must now be taken, in turn,

reduce the non-atomic capability to a point where Free World forces would probably be obliged to initiate the use of the weapons to oppose effectively any major act of aggression. The converse is also true with respect to the use of atomic weapons by enemy forces, although having started with a larger force structure than NATO the Communist group can afford to allow more overlap in their conversion from a non-nuclear to a nuclear posture and will thus retain a greater conventional war waging capacity than the U.S. for a slightly longer period of time.

Up until recently, the relatively limited enemy atomic capability did not pose a threat to the whole panoply of military targets. When atomic stocks were limited, both sides could safely be counted on to budget the weapons they possessed, reserving them for targets of a primary or decisive nature. As long as this condition existed, it was possible to choose between conventional and atomic war since large segments of the forces could count on immunity from atomic attack even in a nuclear war. The existence of the nuclear weapons had not as yet effected our conventional capability; atomic bombs were an addition to the Allied arsenal, not an essential component thereof.

As nuclear stocks in the hands of potential enemies increase and we approach an era of atomic plenty, two things occur:

- First, more and more elements of our military power - land forces, depots, communications, etc. - must face up to the possibility of coming under atomic attack. Major targets will no longer be the sole recipients of atomic attack.

- Second, combatant levels which heretofore could not aspire to the use of "priceless strategic weapons" can now begin to study and experiment with the atom in relation to their particular roles.

The very existence of this atomic threat to Allied defenses must lead to the adoption of postures - organizations, tactics, dispersion, and weapon systems - that will give us a reasonable chance of surviving should the enemy choose to exploit his capability. Failure to readjust all potential targets so that they can absorb atomic attack would be criminally negligent. Indeed such negligence would attract war by offering the enemy the prospect of quick victory.

This brings us to the inevitable fact that a future major war must now be atomic in nature, since even the minimum postures essential to the ability to absorb and survive atomic attack are incompatible, in many if not most instances, with the retention of a

THIS PAGE IS DECLASSIFIED IAW EO 13526

conventional capability. The very dispersion, mobility, concealment, and freedom from heavy logistic "tail", and from fixed installations, which atomic survival dictates are the antithesis of mass, force concentration, and quantitative firepower employed in conventional war.

The military is thus faced with a dilemma To insure survival in event of atomic attack - a survival which if nothing else is necessary for its deferrent effect - there must be a progressive evolution to an atomic posture. This in turn leads to the inevitable use of such weapons when and where these postures cannot be reconciled with retaining a conventional capability It is clear that when the advent of nuclear weapons imposes upon any force, arm, or weapon system a posture which parts company from that required to fight without the new weapons, there is no alternative, if war comes, but to engage in nuclear operations or accept defeat

Faced with these alternatives, we are again not free to choose whether or not we will fight with atomic weapons if we have to fight Now the question for decision is how long we can afford, or even risk, retaining a progressively decreasing conventional capability, good only for limited use, in face of an increasing and more diversified atomic threat

The Quantity Factor

Finally, if one remains of the opinion that a conventional war capability can be retained in modern Defense establishments, and that these can, in addition, be adequately prepared to respond atomically, and to absorb an atomic attack and survive, there remains the question of quantity of weapons and forces available to prosecute a conventional war of attrition

Delivery systems, that is airplanes, guns, missiles, ships, etc., reflect the characteristics of the munitions they are primarily designed to carry There is a relationship between performance, quantity, and results achievable that cannot be ignored Expensive, complex, and sophisticated delivery systems can only be justified if the firepower they can deliver warrants the cost of the effort The greater the destruction we can achieve with one vehicle or missile, the less such vehicles we need, and hence the more money and effort we can afford to allocate toward performance and sophistication in lieu of on quantity

The advent of atomic, and later thermonuclear munitions allowed the atomic powers to seek optimum performance of delivery systems -- but at the expense of quantity and hence staying power in combat. It is common knowledge that no serious effort was

made to develop the ICBM until the scientists could promise a multimegaton warhead The use of multimillion dollar vehicles to deliver a few tons of TNT is both militarily and economically impractical Thus, the use of weapon systems optimized for atomic conflict, a great cost, to deliver small conventional war type payloads is counter productive in that the results attainable do not warrant the cost of likely losses.

Although the above argument is quite clear when it comes to using ICBM's with non-nuclear warheads, it is less clear though equally applicable, to all modern ships, fighters, bombers, and tactical missiles. The Army's Honest John, at the lowest end of the missile spectrum, is nevertheless designed primarily and justified as an atomic delivery vehicle While Century Series tactical aircraft still have the capability to deliver hard bombs no effort has been made in the last few years to develop and pay for these in the quantities required if they were to be used in sustained conventional combat

For lack of quantity, either in hand, in storage, or quickly obtainable by emergency production, sustained conventional operations do not appear practical in the future As a result, the military has become more and more of a "short war" force. Increased reliance on ready forces, and improved performance geared to atomic warfare, has been at the expense of quantity and mobilization capability. Here again a compromise seems impossible, even if we wanted to.

Even today, the atomic curtain has advanced across the whole range of our forces to the extent that, except in the case of a show of force or police action, the success of any attempt to fight conventionally is questionable on the basis of staying power alone. A few days after the onset of any conventional fight the Chief of Staff, Air Force, CNO, or Chief of Staff, Army, would have to point out to the President that, even at the very low and reasonable loss rates being sustained, he would soon lack the capability to do his primary general war mission, should the conventional conflict suddenly expand. The resulting choice is to use the delivery systems with the atomic warheads and concepts for which they were designed, or lose our capacity to defend the country if the limited conventional war should turn into a major conflict.

The Current Situation

The record is clear. The major powers have gradually evolved into an atomic or nothing situation with most of their military capability. The Russian is no doubt going through the same evolution, though at a somewhat different rate since having started later and with a larger conventional base he can keep a greater potential for non-nuclear warfare somewhat longer than the Free World has been able to do. We now seem to be

in a "gap" period wherein we have largely passed through the atomic curtain and the Soviet hasn't quite as yet. This difference seems to be at the root of much of the contemporary arguments favoring the development of a capability to fight at least major limited wars without using atomic weapons. None of these arguments, however, tell us how to resolve the above basic causes of our evolution towards atomic warfare.

When a new development runs contrary to what many people would prefer, there is a tendency at first to close one's eyes to the facts, and later to argue that since it is not desirable we can somehow prevent it from happening even if it is clearly inevitable. This appears to be the case with respect to the advent of nuclear weapons and their use in various types of conflicts. As a result we tend to adopt policies and force programs, and even play at brinkmanship, based on what we wish the facts were, rather than on the realities of the situation. Some have even been led to argue that a conventional war capability, even in NATO, should be maintained. In these arguments desirability is stressed, but little or nothing is said about the practical feasibility of retaining the freedom of choice in the matter. The military have not argued feasibility in reply to those who seek nuclear disarmament on grounds of desirability, to avoid being accused of wanting to exploit the new weapons. There are also other reasons.

a. First, is the lack of experience in atomic warfare, coupled with a proper reticence on the part of the military when it comes to complicating the already complex political and foreign policy problems by insisting that hard facts be faced.

b. Second, current efforts to ban nuclear tests, fear of the long-term effects of fall-out from tests or from war, and more particularly resistance in some military circles to the force reductions that could result from unequivocal acceptance of the nuclear munition, have prompted a final effort to turn the clock back and return to classical wars of attrition for all plans short of a new world war.

c. And lastly, soldiers have historically started each new war with essentially the same tactics, organizations, and doctrines with which they successfully concluded the last one. Changes in these areas are hard to come by in peacetime. The attachment of senior officers to their past successes, the inability to try out new ideas under actual combat conditions, and the increasing resistance to change of "managerial efficiency" all tend to block progress, in varying degrees. In addition, the military are far from agreement among themselves on all the implications of the new atomic development, let alone the changes that should be made to adapt to these.

0637

If the advent of atomic munitions effected only the conduct of military operations in war, the present situation would not be so serious. Professional tacticians on both sides would eventually sort out the problem. Unfortunately, this is not the case. In the present world atmosphere of protracted conflict between the free and Communist nations, relative military capabilities at any time, and the likely consequence of engaging in active warfare, have a tremendous impact on foreign policy. The political leaders can only do their job properly if the military gives them sound guidance on these matters. Thus, the survival of the Free World may well depend on how well we in the military understand and exploit in peacetime the effects of the new weapons and the accompanying changes in military technology.

Both the military capability and the consequences of its use depend on two things: the weapons available and the tactics and strategies with which they are applied. There can only be one optimum combination in any given time period. In practice it is rarely achieved, since the military capability is invariably somewhat degraded by poor planning, inexperience, and attachment to obsolete concepts. In addition, there is an increasing tendency to place political constraints on the full exploitation of new weapons and strategies. Where these constraints stem from a lack of understanding of the military factors they can be disastrous not only to the outcome of a war, should it occur, but also to the effectiveness of measures taken to deter war.

The importance of the military considerations in our foreign policy, the obvious changes taking place almost daily in military hardware due to technological progress, and the apparent difficulty in obtaining unanimous agreement among the services as to the impact of these changes on the nature and consequences of war, have acted as an invitation to many amateur strategists to try and fill the "gap." The result is all too frequently a shotgun wedding between new weapons and old concepts, tactics, and doctrines. The machine gun is, in effect, added to both sides of a battle between Roman phalankes, exposed in close order formation, and conclusions are drawn as to the outcome.

Those who are not trained in the art of war, and who have none of the inhibitions of actual experience in war, are increasingly free with their views as to the effects of the atomic development on tactics, strategy and international power relationships. They are also inclined to look upon the atomic weapon only as a means of multiplying the destructive capabilities of the arms, and military formations with which they are familiar. As such they still seem to believe that the use of nuclear weapons in future wars can be decided upon in light of the military and political considerations prevalent at the time.

0638

This leads to a tendency to underestimate both the inevitable nature of atomic warfare and the extent of the changes it portends in all matters military. Its impact on foreign policy is now recognized more clearly than its impact on war. This is logical since we have had to conduct foreign policy in the shadow of nuclear war since 1946. Our experience in nuclear warfare during the same period has been limited to planning and maneuver. As a result the nature of atomic war, and its consequences are frequently defined more in terms of what seems politically desirable rather than in terms of what will occur under actual combat conditions.

This condition is dangerous to the extent that it can lead to political and foreign policy actions, in peace or war, based upon fallacious ideas of what the military can and cannot do. We tend to believe we can do what our foreign policy suggests as desirable, particularly where this seems reasonable in light of past experience. The outstanding current example of this tendency is the assumption in many contemporary writings that we can, or should, avoid using nuclear weapons in future conflicts where this appears desirable. The authors in nearly every case discuss the reasons why we, or the Soviet, should not use these weapons but seldom do they consider the feasibility, from a practical military point of view, of retaining freedom of choice in this matter.

The certain use of atomic weapons in any future wars of consequence stems primarily from the diversified nature and the extent to which they are gradually permeating all echelons of the nations armed forces. Due to the fact that early atomic weapons were the sole province of strategic air force for several years they are still looked upon as a separate or specialized weapon system rather than simply a more potent form of explosive -- which in fact they are.

From the point of view of "control" there is a tremendous difference between a weapon system and an improved explosive. A weapon system is a clearly definable component of one's armament. It is one specific link in the chain or part of the whole. As such its withdrawal calls at most for a substitution in the part affected to maintain a suitably balanced force. Many wars, such as Korea can be fought without using such weapons systems as strategic Air Forces, gas or biological agents, submarines, etc. But, is it conceivable to fight any type of war without gunpowder, gasoline, or food?

Future atomic wars are not wars in which the atomic bomb is added to the conventional weapons in use. They are wars in which the explosive agent, previously essential to all types of weapons, has been increased on strength and effectiveness wherever this is found

THIS PAGE IS DECLASSIFIED IAW EO 13526

practical or useful. To withdraw the atomic explosive involves not the change of one link in the chain but rather removing a vital element of every link or weapon system. We can envision amputating an arm and substituting an artificial one, but can we withdraw the blood from one's veins, and still exist or even substitute an alternative to exist? When the full potential of atomic explosives are exploited they will appear throughout the body military." A return to the conventional explosive at this time is inconceivable.

0640

NATIONAL DEFENSE PLANNING PROBLEMS

PRESENT AND FUTURE

SPEECH BY BRIG. GENERAL R. C. RICHARDSON, USAF

TO THE

WESTERN STATES CONFERENCE, AFA

LAS VEGAS, NEW MEXICO

APRIL 8, 1961

THIS PAGE IS DECLASSIFIED IAW EO 13526

INTRODUCTION

Gentlemen:

I am sure that most of you are aware by now of the reorientation of our national security policies that was indicated in the budget message by President Kennedy. This reorientation is clearly a step towards improving the U.S. defense posture. As you undoubtedly noted, while it maintained a standard strategic general war capability, the President's proposal was also directed at augmenting our capability in those areas which some deemed previously negligent -- such as our capability for guerrilla warfare, improved command and control, and survivability of major weapon systems.

I am sure that many of you wonder why it is that such obviously logical changes in defense concepts and plans are subject to so much discussion in the press, and in some cases seem to be controversial. One would think that essential adjustments to our security policies and concepts could be made on a continuing basis and as a matter of routine defense activity. Unfortunately this is not the case for reasons which I will try to explain this morning.

Any analysis of National security policies and the problems associated with changing these calls for an understanding of the relationship that exists between evolving military technology, economic and political considerations, inflationary pressures, and the cost of weapon systems.

New security policies must be evolved in an environment of changing economic and political considerations, changing weaponry, and generally increasing costs as each new system takes over from its predecessors. There is no easy solution to the problem of adjusting to technology. In addition there is little or no resistance to change in weapons or improved capabilities even though this be at the expense of quantity. In fact, such change is actually encouraged by the military services on both sides of the iron curtain. There is, however, interaction between the quartet of weapons, costs, concepts and commitments. It is in this interaction that the greatest potential will be found for a breakthrough in solving the problem of providing for the many diversified security requirements thrust upon us by the protracted struggle, and doing this within the resources that we can realistically commit to these purposes on a sustained basis in peacetime.

On Changing Weaponry or "Hardware"

First, let me make a few comments on the over-riding problem of "Changing Weaponry or Hardware."

Beginning with the great impetus given to military research and development in World War II, military hardware has increased in both cost and performance at an exponential rate. The relative increase in cost, however, of each new generation of weapons, whose purpose generally has been to

THIS PAGE IS DECLASSIFIED IAW EO 13526

take over the role or activity of an earlier weapon system, has perhaps outdistanced the increase in performance. We cannot say, therefore, that the military capability of each new weapon system has increased in direct ratio to its increase in cost.

The requirement for improved weapon performance has in part been a product of unanticipated technological break-throughs in the overall revolution in weaponry, but also, and perhaps more significant, by the constant need to keep abreast of a changing Soviet threat. For the past 15 years, both the U.S. and USSR have been engaged in an effort wherein each family of weapon systems seeks to overpower either its offensive or defensive enemy counterparts.

The development of weapons has also been accentuated by the manifold increase in military responsibilities which range from additional international commitments to new weapon concepts such as space and BMEWS. These new commitments have been generally added to existing military requirements, such as the DEW LINE, and the NATO defense.

Contributing to this "snowballing" of requirements for military hardware has been not only the lead time required for the weapons themselves but also the lead time for their elaborate and increasingly expensive support structures which are not always suited to the replacing generation of weapons. For example, a "forward" base structure built at great expense to support aircraft is not equally adaptable to the support of newly deployed missile units.

(3)

We have noted that technological progress and progress and Soviet competition have contributed to a constant turnover in weapon systems. The increased sophistication and performance of new systems has also been marked by a great increase in the costs per unit or weapon. One recent study suggested that increasingly the statement of modern force requirements and their dollar costs are so great that our choice seems either to be death by enemy explosion or economic self-destruction.

In practice we would in fact be faced with this dire choice were it not for the fact that our defense concepts must be recognized as a variable as well as weaponry, costs, and quantity of forces and systems. Thus a major, or sustained minor, change in any one of these factors eventually must cause a readjustment in the other. Since technology is giving us new weapons with spiralling costs, we will start our analysis with some estimates as to the-pressures generated by the economic factor and political demands against resources likely to be available. My goal here is to try and estimate what may be available to the military planners in terms of increased or decreased resources during the next decade.

Economic/Political Considerations

As a basis for this part of my discussion, I have used the report by the Committee for Economic Development headed by the noted economist from Harvard, Otto Eckstein. The major

THIS PAGE IS DECLASSIFIED IAW EO 13526

political and economic factors that will limit the extent of military outlay in the foreseable future can be summarized as follows.

First, the gross national product. The Committee uses as a basis for their projection a 3% growth factor. This factor is based on historical data and at the same time is one which they felt would be feasible without inflation. This gives us as a point of departure the 1961 GNP of 508 billion and a projection to approximately 680 billion by 1970.

Our second guidepost is the federal revenue Working from this GNP projection one derives as a planning factor an estimated total revenue Using these same estimates coupled with those prepared by the Treasury in the 1960 budget we arrive at a figure of approximately 120 billion available for total government expense in the 1970/71 period.

Third, let us look at the political and economic pressures which are brought to bear on this total revenue.

Using the Committee for Economic Development's report and various studies by government agencies we can reach a tentative conclusion that the pressures of international affairs and domestic affairs will not diminish to any sizeable degree in the next ten years.

Here a note of caution is added. Not all programs were assumed by the Committee to increase. Our projections here are intended to be net -- not increases in all specific programs.

THIS PAGE IS DECLASSIFIED IAW EO 13526

International affairs today take approximately 1.9 billion. The report forecast that this will increase inevitably as we strive to deal with the underdeveloped area problems of the next decade.

Commerce, housing and space technology will also generate pressures for an increasing share of our total revenue because of urban development, road construction and improving the general welfare and the low rent housing considerations.

Agriculture, which is certainly familiar to you people here in the West, is forecast to cost a good deal more in the years ahead.

Natural resources -- also a crucial consideration here in Nevada and in the West -- may very well develop because of the requirement for dams, soil conservation and the like.

The development of health, education and welfare, now approximately 3 billion, will also increase though how much depend upon how the programs are funded.

The Veterans Administration, as the World War II Veterans start to get into the '50/60 age bracket will certainly go above the 5.2 billion figure of today.

Interest on the debt is fixed in the neighborhood of 8.5 billion. Some rise may occur here if the Treasury runs into some refunding problems of higher interest rates.

THIS PAGE IS DECLASSIFIED IAW EO 13526

Detail dollar estimates on all these areas for the 1960's are given in Dr. Ecksteins Report. What we are interested in however is what's left for defense. Now if we add to the non-military demands military assistance which may shift from military aid to economic and technical assistance and the application of atomic energy for useful and peaceful means, this brings the military planner to a figure in the neighborhood of 53 to 55 billion that potentially could be made available for Defense.

In taking 53 to 55 Billion as a planning figure for defense spending by 1970/71 we must accept three assumptions. First, that taxes will not go up to any great extent; Second, that productivity, will not exceed a 3% growth rate; and lastly on the other side of the ledger, that all revenue not absorbed by the other government needs discussed will in fact be available for defense - none in other words will go to raising the standard of living. Obviously, major changes in these assumptions would upset our calculations but only as to the extent to which the economic pressures factor will cause changes in concepts for defense.

Lets now examine a second pressure area internal to defense; the increase in the demands of the more costly weapons, R&D, administration, and operations and maintenance on the elusive defense dollar.

THIS PAGE IS DECLASSIFIED IAW EO 13526

Overhead Costs

The increased sophistication and performance of new systems has also been marked by a great increase in the costs per unit or weapon. Thus, concurrently with the political and economic pressures, we must also consider the increased costs of R&D, personnel, and defense systems, all affecting the extent of our "ability to deliver," the final factor in our analysis.

Turning first to R&D outlays, one of the major elements in the rising costs of hardware has been the "revolution" in the research, development, and test performance areas. The overall R&D effort has, in fact, been a major national undertaking. AEC R&D expenditures, for instance, have risen from $275 million in 1954 to over $825 million in 1960. Total government expenditures for R&D have risen in a similar fashion, totaling less than $1 billion in 1954 and now reaching more than $6 billion annually.

Production costs for almost every new weapon system have increased due to the increased complexity of high performance aircraft/missiles. The cost of the aircraft transparency of the F-80, F-86, B-47 types runs in the neighborhood of $5 per square foot, but the B-58/X-15 type windshield costs qpproximately 30 times that.

The cost of operating and maintaining new systems has also increased. It costs $500 per hour to fly a B-47. But the modern B-52 costs $1300 per hour to fly. This trend in operations

and modification costs of defense has also been encountered in most other areas such as Defense Department communications and electronics systems.

The cost of current bombers is 1.5 to 2 times that of their immediate predecessor. The cost of the next generation of bombers will be double that of the current bombers, or 3 to 4 times those of 1950. In the missile field, research and development have reached a multi-billion dollar figure, and the re-equipping of all types of forces with missiles will be even more expensive.

Since the end of the Korean War, military manpower strengths have been steadily reduced. However, the PERSONNEL COSTS of maintaining a force of 2.3 million men in 1960 are about the same as the Korean period personnel expenditures. Concurrently, the average wages of the "blue collar" civilian employees of the Defense Department have steadily increased, even though the total number of such employees has also been reduced.

The retired pay of military personnel is now less than $1 billion annually. However, within a few years when the retirement rolls are increased by the men who entered the Armed Forces in World War II, it is estimated that our annual retirement costs may well exceed $3 billion. Likewise, the costs of maintaining bases and supplying other types of support have increased steadily.

Ability to Absorb Attack

Another shift in defense spending is taking place. The nature of the changing strategic threat to the United States has resulted in more and more funding allocations whose purpose is the Ability to Absorb Attack. This has required us to emphasize "hardening" to increase survivability. (e.g., SAGE Centers and ICBM sites). The airborne alert and base dispersal programs are based on the need to retain a retaliatory capacity should we be attacked. Many support items are being stockpiled. Much of the expansion of funds in the electronics-communications area has been based on the necessity for assuring communications should an attack be made against the United States.

Ability to Deliver Attack.

Continuing our analysis, it is important to consider what has happened to the costs of the weapon systems which compose our Ability to Deliver Attack in retaliation. In USAF fighter aircraft, we have watched the inventory change from F-80's at $100,000 each, through F-84's at $300,000, through F-100's at $750,000, to F-105's at twice the cost of the F-100. The atomic submarine costs 20 times its World War II prototype for just the vehicle - not including its POLARIS missiles. The aircraft carrier since Korea has risen from approximately $100 million (excluding the costs of crews, aircraft, and munitions) to $500 million. The increasing cost of missiles further squeezes funds available for the "Ability to Deliver Attack."

As a result, strategic plans have been modified and the number of active units has been decreased. To be sure, much of this quantitative decrease has been compensated for by an increase in capability, but there is some question as to whether the compensation has been sufficient.

Inflationary Pressures.

Since the Korean War, the monies allocated to defense have tended to remain in the neighborhood of 40 ~~millions~~ billions of dollars. At the end of the Korean War we were allocating approximately 12 per cent of the GNP to defense expenditures; by 1958, this allocation had fallen to 9.0 per cent.

In other words, the percentage of the Gross National Product allocated to defense has tended to decrease over the last few years. The real impact upon defense activities has been magnified further by the concurrent inflationary trend which has resulted in the defense establishment receiving successive allocations of dollars with less purchasing power.

The Consistency in Military Commitments

Against this trend we find that our peacetime military commitments have increased. We are now obligated to support a number of multi-national security arrangements, such as NATO, CENTO, SEATO, OAS, and ANZUS, as well as a number of bilateral security pacts, such as those with Canada, Japan, Korea, and Taiwan. In addition we have to maintain our Continental Defense Posture and sustain our strategic war fighting capabilities.

THIS PAGE IS DECLASSIFIED IAW EO 13526

The situation that results from the conflict between the consistency in jobs to be done and decrease in funds available to buy the military tools to do these is what we in Air Force planning call the "Defense Cost Squeeze."

When it occurs, the pressures for more and more money grow more intense within and without the Defense establishment, with competing claimants representing almost every functional area and conceptual group. Since eventually some adjustment has to occur, lets see what generally happens.

Defense Resources

The cost squeeze cannot be solved by merely increasing defense budgets to meet the use in cost and shift in emphasis I have described. As we assess the future, it appears that any sizeable increase in defense expenditures would require a reappraisal of U.S. economic and political views on tax rates, the size of the national debt, and other considerations. Although some increase in the future can be expected, past experience shows that it is unrealistic to assume that overall defense expenditures will be greatly increased during times of peace, especially to the extent necessary to cope with rising costs of new weapons and other defense factors. While some temporary increases will no doubt occur, these cannot satisfy the majority of claimants over the Long Term. To be sure, some of the more difficult funding decisions would be postponed, but it appears that within several years they would have to be made.

0658

THIS PAGE IS DECLASSIFIED IAW EO 13526

Normal Adjustment to the Problem

Looking at normal adjustments to the problem, we can say that there are several courses of action.

a. Plan, program, and budget, better in-house.

b. Eliminate "waste" and "duplication."

c. Reduce stockpiles, "non-essential" programs, etc.

d. Stretch out procurement.

e. Cut research, development and test evaluation (RDT&E).

f. Re-evaluate "uncommitted" forces.

g. Finally, accept major changes in concepts and/or commitments.

Better planning, programming, and budgeting must be accomplished by military planners. Heavy emphasis must be placed on these factors and better techniques and procedures must be developed. This area is one in which I hope results will be forthcoming. Internal improvements can result in substantial dollar savings and these improvements must be made.

Elimination of military waste and duplication is a continuing process, and certainly is one that contributes to a solution of the problem but not in the Long Term.

The reduction of stockpiles and non-essential programs is complicated by differences in the views as to the proper size of the mobilization base. Do we need a 30-day supply or a 120-day supply? To what degree will we depend on non-nuclear weapons? These problems must be dealt with before this course of action can help us materially in the 1960's.

THIS PAGE IS DECLASSIFIED IAW EO 13526

We have tried stretching out procurement, but the recovery of dollars becomes very small. Cutting RDT&E, for example on the F-108's, is like selling your insurance to keep the Cadillac going. In the long run, you really suffer.

Re-evaluation of uncommitted forces such as Air/Sea Rescue and ships on the DEW Line contribute very little to dollar savings and is only a temporary solution.

In the final analysis, the solution seems inevitably to lie in changing concepts and/or commitments.

When we have tried all other devices to meet the cost squeeze inevitably imposed upon us, like death and taxes, by the forward march of technology we then have to face up in the military to changing the last remaining variable, our concepts. In brief we must figure out new ways of doing the defense jobs that have to be done -- ways that balance out the increased cost and capability of the products of our technology with the quantity and economic factors.

On Changing Concepts

Let me now address myself to this all-important question.

Why, in the final analysis, does the solution appear to be one of changing concepts? This is by far the most difficult variable to grasp. Weapons and dollars are tangible and can be readily understood; concepts are evasive and oftentimes are not easily understood.

THIS PAGE IS DECLASSIFIED IAW EO 13526

First, I think we must be quite clear as to what we are talking about when we refer to concepts. I am using the term in this presentation in the broadest possible sense. In other words, there are two factors to the military establishment, the hardware and how one uses it, and concepts or "software."

For lack of a better term, I am grouping all aspects of how one uses hardware, in other words, "software", under the title "concept."

The relationship that exists at any given time between military hardware, its cost, and the concepts for its employment will determine to a large extent the effectiveness and the defense posture.

Most of the errors in long-range plans and programs can be traced, in retrospect, to failure to properly equate hardware, costs and concepts, in time and space, as a result of erroneous estimates as to what extent of change is needed in the concept element to obtain an optimum combination.

This occurs, for instance, wherever we find ourselves planning to use WW III weapons in accordance with WW II tactics and strategies, when we build general war forces designed for long wars of attrition, when we envision only short atomic conflicts, or when we assume that the targets adopted for strategic bombing will also be the optimum system for space delivery vehicles to attack.

(15)

THIS PAGE IS DECLASSIFIED IAW EO 13526

Both the US and USSR have allocated a tremendous amount of money and manpower to research and development of weapon systems in the past 20 years. The same cannot be said to be true of research and development in conceptual areas, or in how these systems may be used. In fact, it seems quite clear that in the area of concepts and all that goes with it (tactics, doctrine, and organization), the research and development effort has been limited to a very few people who have had a very narrow audience and very limited resources. Compare this shortage in conceptual R&D effort to the thousands of technicians in industry and in the materiel establishments of the services who are working - full time - on improving military hardware.

When we reflect upon military history, it seems to have been easier to change military hardware than military ideas and organizations. For example, the last U. S. cavalry charge was purportedly in the Spanish-American War; yet the cavalry was not disbanded by the United States until we were in World War II and 41 years later. Concepts, force requirements, and organizations have not kept abreast of technology.

Hardware is a relatively predictable factor by comparison to concepts. The new weapons we can have at any point in time depend principally on the rate of technological progress. The rate can change, depending on the funding given R&D, but is subject to fairly accurate projections insofar as general weapon types and performance are concerned.

(16)

THIS PAGE IS DECLASSIFIED IAW EO 13526

Changes in concepts, on the other hand, are not nearly so easy to predict or adopt. While often triggered by changes in hardware, they normally orginate in assumptions and opinions rather than in technical data. There are strong factors that resist conceptual change. Let us examine several of the most common pressures.

A significant contributor to arresting conceptual change has been the relatively slow rate of modernization of peacetime military forces. There have been long periods in which the weapons of the armed services have been heterogenous mixtures of the old and the new. Senior officers who fought successfully with the old weapons never see them dropped completely from the inventory. Organizational and conceptual schemes developed from the preceding war appear to remain valid.

Peacetime managerial systems at times contribute to the institutionalization - through "administrative improvements" - of existing organizations and procedures. The combination of old weapons, war experience, proven organizations and concepts, management techniques, and efficiency procedures all contribute to the creation of "conceptual lags."

The net result of the inequality that exists as between the evolutionary tendency of weapons development versus that of the concepts under which we use them is to generate a cycle in which military hardware changes while concepts tend to remain

THIS PAGE IS DECLASSIFIED IAW EO 13526

constant. This creates a growing "gap" between weaponry and our ideas of how to employ the weapons. The "gap" in turn generates economic and political pressures which eventually overcome the resistence to conceptual change that I have already discussed. When this occurs in peacetime an "agonizing reappraisal" occurs, one such as the "New Look" of 1953 - concepts are brought back into phase with the new weapon capability and the cycle starts over again.

Thus we find that with the introduction of new weapons at an ever-increasing rate one of three things must occur:

- defense expenditures must go up, or
- quantity of weapons and forces must be decreased by developing new concepts, or
- commitments have to be decreased.

Let me cite some examples of how this has happened in the past and what appears to be a rational course of action for the future.

The First Example: deals with the New Look of 1953. Cost of weapons were increasing, funds available remained constant, our commitments remained constant, and hence we had to change our concepts to a nuclear posture. We were able to change concepts then by fully exploiting a hitherto unused capability - the atomic weapon. Unfortunately, this kind of dramatic new capability is not ordinarily available to us.

THIS PAGE IS DECLASSIFIED IAW EO 13526

The Second Case: Let's examine the history of NATO defense planning. In the early years of NATO, traditional concepts of land, sea and air called for the containment of the enemy military capability by the equal quantity of allied troops or mass. The traditionalists prevailed until the Lisbon Conference of 1952, when a nuclear defense concept was adopted. The principal motivating force in this conceptual change was probably not so much military advice as it may have been the obvious reluctance of the member states to fund a non-nuclear defense. Political and economical pressures seem to have forced the change to reliance on nuclear weapons concepts although the latter had been available for 7 years. The alternative to accepting the savings inherent in the use of atomic weapons was the possible collapse of the Alliance.

A Third Case: Let me call this "graduated deterrence." If one favors a policy of graduated deterrence, he is still faced with increasing cost of weapons. He is also faced with increased commitments. If concepts remain the same this must lead to a tremendous outlay of additional funds, which in our model will not be available in the magnitude that is required to sustain such a trend.

A Fourth Case: The present trend. The present trend is that, although the cost of weapons is increasing and total funds available for Defense are increasing approximately $1 billion per year, a change in concepts is still required to offset the squeeze on funds.

Before leaving this point, there is a fifth example. This one is the common view which says: "Cost of weapons are going to increase, you can't have any money, you can't change your commitments, and you needn't change your concepts, so just carry on and do your job." This approach needs no comment to demonstrate its impracticability.

When economic and political considerations limit the amount of funds that the military can obtain for national defense, the military has to choose between implementing its classical concepts, with less material and hence forces -- a course of action which is invariably interpreted as a reduction in the military power of the nation concerned -- or developing new concepts that require fewer forces.

Obviously, if military leaders state they require a given amount of force to accomplish certain tasks and the economic and political elements deny them the funds to produce these forces, the logical conclusion is that the defense capability has been reduced. This seems to be true regardless of any actual improvements arising from the introduction of new weapons.

So long as technological advances continue, the above pressures will be felt constantly. In each country, when the budget has reached a ceiling for the time period concerned, or when the military has absorbed all the reductions in quantity that they can rationalize without admitting a major degradation in national defense, then a reappraisal of concepts in light of the new equipment becomes inevitable.

(20)

At this point, I would like to pause and discuss a suggestion frequently made that we should meet this rising cost trend by producing "cheap resistance" in order to continue those functions and activities which do not require the more exotic materiel. This particular suggestion when used in terms of military assistance is referred to as "simple weapons for simple people or simple tasks". While this idea is theoretically interesting, it does not appear to be very practical. In the first place, the people who are recipients of these weapons do not consider themselves as simple people. They want the best, as does everyone else. On the other hand, those who have to undertake these "simple" tasks tend to complicate the tasks and also want equipment to carry out their job that is at least as good and as sophisticated as the equipment used by those who are engaged in more vital activities.

I think the classic example of this is a recent U.S. industrial effort to produce a relatively simple and useful modern fighter for NATO. Theoretically, it was designed to be a tailored weapon at minimum cost to achieve a desired task. In practice, what happened? The airplane concerned priced out at about the same as the F-100, which was certainly not designed for economy or specialized use.

Relationship of Change Between Hardware and Concepts:

Now that we are quite clear on the fact that hardware evolves steadily and change is encouraged, and that concepts

THIS PAGE IS DECLASSIFIED IAW EO 13526

change with difficulty, we might examine the relationship between the two since World War I.

First you will note that the cycle has produced periods of relative consistency in concepts and security policies. These can be identified by some of their major characteristics.

During the era between World War I and World War II our national security policy was one of relative isolationism, and our defenses relied principally upon small expandable forces designed to act as a nucleus for wartime mobilization. During the era shortly following World War II, our national security policy was changed to recognize the need for alliances and overseas deployment. Our defenses relied primarily on a ready and balanced land, sea and air capability. In the nuclear/bomber era that followed the "New Look", we again saw a change in security policies. The need for ready forces continued, but for our allies as well. Emphasis was placed on the U.S. strategic atomic capability. Our global defenses in this period were based on the concept of the "Sword and Shield."

Had you asked military planners of this period to develop a projection of force requirements for industrial production in 1965, the Army would have projected the balanced force concept with its 24 Army divisions. Yet two years later, the Army was demobilizing to 14 divisions. Likewise, in the mid 1950's, the Air Force would have told industry to plan

THIS PAGE IS DECLASSIFIED IAW EO 13526

aircraft production for about 137 wings. There are now fewer than a hundred wings programmed. This sort of example suggests that long-range security planning has got to come to grips with conceptual discontinuities or changes if it is to serve a useful purpose. The problem is, therefore, what causes these changes or reappraisals and when are they likely to occur?

On Future Planning

If we understand the above relationships and the factors that lead to periodic reappraisal of concepts and doctrines, not only can we exercise some control over the extent and nature of the changes, but we can anticipate these in our long-range plans and force programs.

Conversely, if we continued to resist these changes, and plan on the basis that our current concepts, doctrines, and force levels will remain valid, we can expect waste, confusion, and constant short-term readjustment of programs to the detriment of a sound defense posture and security policy.

Adjustments in concepts to take full advantage of technological progress is the "key" to having modern weapons with an effective defense at an acceptable cost.

Conversely, adding new weapons to classical concepts, or going back to older concepts, as is the tendency on the part of many, leads to more and more expenditures for a less and less effective defense.

THIS PAGE IS DECLASSIFIED IAW EO 13526

Thus, an understanding of the role that changes in concepts -- the method of waging war -- play in the cost and effectiveness of a defense effort in any time-frame goes a long way toward explaining many of the current controversies over the adequacy of our defense effort. Specifically:

- Those who wish to add the new weapons to classical methods of waging war will always claim the current effort to be inadequate, since rising costs have resulted in a steady quantitative reduction of forces contrary to the classical idea of mass.

- Those who understand the need to change concepts along with the advent of new weapons accept the New Look force reductions as reasonable and proper in light of the changes in the nature of war as they see it, and can even foresee more reductions.

In assessing the next 10 to 15 years, the question is not whether additional "New Looks" will be appropriate, but rather whether or not in this era of protracted conflict we can again tolerate their provocation either by war or politico-economic factors. Weapons are changing so rapidly that to wait for another Pearl Harbor may be to confess defeat or annihilation. The military community must somehow discard its traditionalist mantle for a cloak of innovation and intellectual objectiveness.

This new need to make radical changes in our ideas of how to use our weapons in peacetime, without test in war and of how to develop even newer weapons in the greatest military challenge the free world has ever faced. The capability of future weapons may be so dramatically different from any

THIS PAGE IS DECLASSIFIED IAW EO 13526

existing weapon that any attempt to wed the future with today's established doctrine may be pre-ordained to the failure of both. The combat troops of space may be miniaturized digital computers!

One approach to resolving this dilemma is to analyze the conceptual gaps of the last decade wherein weapons development has so far outdistanced concepts and military organizations that a major adjustment has had to be made. Through an analysis of such periods and of the junctures where new concepts were adopted, we may be able to identify some of the "sign posts" which indicate when a new conceptual "gap-o-sis" is developing.

In other words, I suggest that our long-range security planning must henceforth contain a large "change" factor if it is to be realistic. Certain things are going to take place whether we like it or not. Other possibilities can be influenced only to a minor degree in the near, and in some cases, the distant future.

Long-range national security planners are like ants riding a log down the river. If they all paddle on one side they may steer the log towards one shore or the other. No amount of effort, however, will push the log back upstream very far nor can they beach it and take it to an objective inland even though both of these destinations are theoretically attractive.

New concepts and plans are based solely on pure requirements. That is desirability alone - can lead to costly programs that fail when caught up in the cost squeeze. Our own 137 wing program of the mid 50's is an excellent example. Although a valid goal it was outside the economic banks of our river of time. As we learn more about the art of long range planning, and consider achievability as well as desirability when launching policies we can hope that change and conflict over defense strategies will disappear as long range stable programs, geared to the economic and technological facts of life emerge.

Meanwhile, as an optimistic note, I propose a toast: "confusion to all our enemies also! !"

THIS PAGE IS DECLASSIFIED IAW EO 13526

DEPLOYMENT OF STRATEGIC SYSTEMS OUTSIDE
CONTINENTAL UNITED STATES, 7 DEC 1960

THIS PAGE IS DECLASSIFIED IAW EO 13526

(20)

AFXPD-LR
7 December 1960

ON THE DEPLOYMENT OF STRATEGIC SYSTEMS OUTSIDE CONTINENTAL U.S.

1. One frequently hears the argument that we should seek to deploy ICBM's and IRBM's outside the Continental U.S. in order to draw fire away from U.S. cities and populations should these prime targets be attacked in war. This paper proposes to examine this proposal.

2. The argument must be examined within one of the following three possibilities:

a. The U.S. policy of deterrence of major war is successful.

If this occurs there is no war and the question of location of the deterrent force versus collateral damage is not pertinent.

b. Deterrence fails, a war ensues, and the Soviets attack the U.S. military forces (missiles) and the major U.S. industrial and political centers simulteanously.

In this case any collateral damage prevented by overseas deployment of all strategic systems would be insignificant compared to the losses which would result from the direct and premeditated attack of the U.S. industrial capability and other important targets of military significance colocated with population centers.

c. Deterrence fails, a war ensues, but the Soviets attack only U.S. strategic forces, all of which are deployed outside the U.S.

This is the only occurrence that could conceivably validate the argument for deploying these systems overseas, and then only if one can rationalize such a Soviet strategy.

Likelihood of an Attack Limited to Overseas Systems

3. Our strategic forces are designed to respond to a Soviet attack by retaliating against the USSR. Unless the USSR deployed its forces overseas, or offshore, it is hard to visualize a situation where the Soviet would be willing to leave the U.S. undamaged while accepting retaliation against the USSR.

0676

THIS PAGE IS DECLASSIFIED IAW EO 13526

4. A Soviet attack of our strategic forces outside the U.S. alone, could only occur if the Soviet had absolute confidence the attack would prevent any U.S. retaliation; or if it could be assumed that we would surrender rather than retaliate with what we had left and suffer the consequences of a subsequent nuclear attack on the U.S.

5. The first possibility, total destruction of our retaliatory forces by surprise attack goes contrary to all efforts to achieve warning and survivability. It assumes even Polaris as vulnerable to sudden surprise attack.

6. The second possibility accepts defeat as the inevitable outcome of any Soviet first strike no matter where our forces are. If this idea were agreed preventive war would be the only counter to an enemy with known aggressive intentions.

7. In actual war, therefore, it must be assumed that overseas deployment of strategic forces would only protect the U.S. from damage of consequence if we admit complete vulnerability to a Soviet first strike, or the willingness to surrender before retaliating. Both assumptions are preposterous. One can hardly envision the Soviet Union accepting an attack by U.S. forces without responding against the U.S. Therefore, we must conclude that, if we fight at all, the U.S. will be hit one way or another and overseas deployment of strategic forces won't reduce the damage to the U.S. in any reasonable degree.

<u>On Credibility of the Deterrent</u>

8. What about the relative deterrent value of deploying forces overseas versus in the continental U.S.? I suggest that overseas, or at sea, deployment of all strategic retaliatory forces would greatly reduce the credibility of our deterrent.

9. Obviously, the Soviets know that the U.S. would respond with an all-out attack against the USSR if they were to attack U.S. population centers and industry. The same is equally true if the Soviets were to attack missile sites within the continental U.S. On the other hand, an attack directed solely against strategic missile sites outside the U.S., with no concurrent attack on the continental U.S., could seriously raise a question of doubt as to whether or not we would respond against the Soviet Union and thereby invite subsequent attack of the U.S. The decision to initiate massive destruction within both the U.S. and USSR, following an attack of missile sites outside the U.S., would then become ours.

10. While at first glance one would be inclined to say that we would automatically respond to an attack against our strategic systems no matter where they were based, on second thought this might not necessarily be the case. Would we really attack targets in the USSR if the Soviets subjected our Polaris fleet to "slow attrition"; if the Soviets hunted down our Polaris submarines on a day-to-day basis? Is massive retaliation the answer to the loss of a few Polaris submarines? Or would we engage in a limited naval war in which we would risk and lose elements of our primary strategic retaliatory forces while the most the USSR risked were some ASW units? Clearly, such a trade (hence war) would be highly advantageous to the USSR. It is what could occur if we place undue reliance on Polaris or other overseas systems for national survival.

11. It seems quite clear that the credibility of our deterrence and response in the minds of the Soviets against an attack directed at U.S. strategic forces will be greatly lessened if all or any large share of these were to be deployed outside the U.S. If the credibility is less, our deterrent posture has been downgraded since credibility is an essential ingredient of deterrence.

12. Regardless of the fact that the possible profit in deploying ICBM's from the point of view of either damage or deterrence, there are other factors which make deployment outside the continental U.S. undesirable. Specifically, these are: pre-launched vulnerability, command and control problems, political implications, and systems costs. Let us examine these:

Pre-Launched Vulnerability

13. Deployment of ICBM's to U.S. owned or controlled areas such as Alaska or Okinawa would place these weapons within range of the Soviet short range delivery systems which include tactical aircraft, short range missiles and submarine launched missiles. This would increase the vulnerability of our systems. Deployment of ICBM's to very remote areas such as Central Africa or Ethiopia will preclude many of the prelaunch vulnerability problems common to Alaska or Okinawa.

Command Control Problems

14. The problems of command and control invariably increase with distance. As the Air Force position is to place all strategic weapon systems within one command, the ICBM's would remain under CINCSAC regardless of their physical location. Deployment

of ICBM's to Alaska or Okinawa would add to the problems of command and control by virtue of the distance and remoteness from the SAC control center. This problem would be further aggravated by deployment to other locations such as Central Africa or Ethiopia which do not now have adequate communications and the distances involved are considerably greater. While this is not a major problem, it must be considered to take advantage of minimum warning time and the fast reaction capabilities of the ICBM force.

Political Implications

15. While there are no adverse political implications to deployment of ICBM's to Alaska, Okinawa would present a somewhat different problem. While Okinawa is presently under U.S. jurisdiction, there is a strong pro-Japanese feeling throughout the island. This is further aggravated by the anticipation that the island will return to Japanese control in the near future. It is assumed that this, plus the Japanese resentment toward nuclear weapons, will present a political problem which would preclude deployment of ICBM's to Okinawa. It would appear that each of the other countries in which ICBM deployments could be contemplated, such as Central Africa or Ethiopia, would consider this deployment most reluctantly. Each country concerned would realize that if ICBM's were located within their boundaries they would become a potential target on behalf of the U.S. and subject to devastation as a by-stander in any major conflict. The reluctance to accept missile bases is evidenced by the many problems recently encountered in attempting to deploy IRBM's. From a political standpoint, most foreign governments are subject to severe public criticism and possible overthrow when dealing with missile deployment locations. Other governments have seen the necessity for a unified "free world" stand against potential Soviet aggression but have shied away because of political complications. Therefore, from a political standpoint, it would seem that consummating governmental agreements with other countries for the deployment of ICBM's would be practically an insurmountable task. Also there is the possibility that if a foreign government did agree to the acceptance of U.S. ICBM deployment in their country, a future government may reconsider and request these missiles be removed for political reasons. In any event, U.S. strategic forces in most areas of the world would not be unilaterally controlled by the U.S.

System Costs

16. The costs of constructing and maintaining an ICBM site outside the U.S. will be considerably greater than within the continental U.S. Facility construction costs are

higher than the U.S. average by a factor of 2 to 4, while maintenance and operating costs are 15% to 20% higher.

Conclusions

17. It seems clear that even a rudimentary analysis of this problem shows that there is no profit in basing the strategic retaliatory force outside the U.S. in toto. This does not mean that there may not be some advantage to diversify its deployment on a worldwide basis, by maintaining some elements of the effort, such as Polaris and possibly IRBM's in overseas areas. It does mean, however, that we will always have to retain a major portion of the U.S. strategic effort within the continental U.S. if we want an effective deterrent. So long as this is true there are no valid arguments to the effect that deployment overseas would reduce damage to the U.S.

A DISCUSSION OF THE IMPACT

OF OVERCENTRALIZATION AND OVERREGULATION

ON

COSTS AND INITIATIVE

1. The Air Force is entering a critical period from the point of view of being able to finance its responsibilities. The cost of weapons is on the increase, while our target systems and our force commitments remain relatively constant. This means that within a fixed budget we are constantly faced with the choice of either eliminating current, or future, weapon systems, or major units -- our bread and butter -- or else finding savings in other areas.

2. If savings are not achieved by cutting out weapon systems or reducing the Air Order of Battle, then they must obviously come out of the overhead, support, and management areas. It is the purpose of this paper to examine the possibilities of economies in these areas. The problem of reducing overhead expenses cannot be divorced from that of optimizing our organization. The more an organization can be streamlined and made efficient, the less manpower we find expended in non-productive or overlapping direction.

3. The Air Force organization starts with the basic flying unit, the squadron, group, or wing. Everything above the wing must stem from the requirement to make the wing most effective. If the wing organization is the best for the type of equipment, and the maximum number of actions and decisions are made at wing base level the work load, communications, and personnel requirements at higher levels will be at a minimum.

4. Conversely, the more actions and authority are centralized at higher levels the greater is the requirement for intermediate staffs to process these, up and down, more work is generated, more people are involved and the full capabilities of the lower echelons are not used. In addition, waste is incurred in direct proportion to the inability of the action level to fully exploit local conditions.

5. Centralization results in savings only when the resulting elimination of duplication is not more than offset by the increase in depth of the organization. For example, if we can pool three armament sections into one under one chief savings in personnel result. If, however, the pooling of 100 armament sections under one direction requires the creation of say two armament group headquarters and one armament division headquarters, the odds are that the costs of these will far exceed the savings incurred through the centralization of the direction over the 100 sections in the first place.

6. It is a well known organizational fact in industry that beyond a certain size decentralization of direction produces greater efficiency at less cost since any waste from duplication or lack of standardization is more than offset by savings in overhead and as a result of initiative at the operating level. We seem to have lost sight of this fact in the USAF in recent years.

"Mushrooming" in the Air Force

7. During the past few years the USAF has attempted to make managerial savings primarily by the process of arbitrary budget cuts and force reductions. This has produced some economies. There are limits, however, to the extent that one can economize by this procedure.

8. We must assume that in general, existing manpower and money requirements are justifiable to implement existing missions, functions, and activities in the manner prescribed by current regulations, laws, and customs. If this generalization is true, then major savings can only be made if we are prepared to make major changes in these activities, and in the regulations, laws and customs that direct these. The across-the-board cut is no longer the solution.

9. The Air Force, like all large organizations, has been subject to the Parkinson's Law. Our organization started out under some very sound principles developed by Dr. Learned of Harvard, and General Vandenburg, after extensive research into the principles of an effective military structure.

10. With the passage of time, there is a tendency for peacetime organizations to mushroom. Each level seeks to place its function on a higher plane. A chart which started out as a classical pyramid gradually spreads as everyone seeks to appear on the level with the Chief.

0686

11. With the passage of time special staffs consolidate their control over their field of responsibility to the point where command prerogatives are assumed by staff sections in these fields; staff pyramids development in which subordinates look more to senior staff officers in their field for guidance and direction than to their immediate commanders; and a form of protectionism appears in which various staff agencies encode their increased authority and separate powers in regulations, directives and manuals.

12. In the classical military organization the commander was given a mission or task in broad terms and the resources to accomplish it. He was not told in detail how to do it. The effectiveness of his organization was judged upon the results he achieved rather than upon his ability to comply with detailed directives and regulations.

13. In recent years, I noted with some concern a change in the attitude toward command and control in the military establishment. Shortcomings and failures are not punished. Instead, they are attributed to inadequate regulation. The subordinates concerned are either excused, or only lightly admonished, and additional regulations are written in an effort to prevent others from making the same mistakes. The more we regulate the less we can expect to hold commanders responsible for results. The ability to exercise judgment and initiative becomes secondary to that of following instructions regardless of whether or not there is a better or cheaper way of doing things.

14. The result of the above process is to make the commander a referee between the book and its implementation. Individual judgment, the possibility of exploiting local situations, freedom and flexibility in methods to produce results, are all sacrificed to standardization and conformity to the lowest common denominator.

15. There are clearly two adverse by-products of the present trend toward overregulation and overcentralization of authority. The first and most dangerous is the loss of ability of the operator of new weapons and equipment to devise, test, and recommend changes in basic unit organization and doctrine, so as to exploit to the maximum the possibilities of new material. The second is the tremendous increase in overhead and cost which results from overcentralization and the resulting mushrooming of staff layers.

16. As an example of waste in centralization, under existing regulations followed to the letter, the staffs of four (4) headquarters, and $37.50 worth of telephone calls were involved in determining whether or not the lines in a parking lot at Seymour Johnson AFB would be painted perpendicular or diagonal to the curb! This sort of occurrence is no exception in today's Defense Department.

On the Loss of the Initiative

17. If the commander who is actually operating new weapon systems is prevented by regulations from researching and testing possible changes in his unit organization, or operations, who then will ever be qualified to suggest these changes? Some years ago an Air Force Commander desired to conduct a test of a composite tactical air task force, which appeared more suitable than the classical WW II Wing, to support a CASF type of operation. This test was never carried out, not because of lack of agreement as to its value, but because the change in organization even though temporary, so upset the centralized plans and activities of the many special staffs involved at all levels that agreement was unobtainable. Additionally, the test could only be done at the expense of violating innumerable regulations, manuals and directives.

18. The net effect of the above situation is that commanders with initiative are limited to making paper suggestions and staff studies of organization changes that could produce economies. These are more often than not vetoed on the grounds that their implementation, even in test form, will upset managerial efficiency. The end product is conservatism and a tendency to continue to operate WW III equipment in accordance with the classical WW II tactics and techniques and within the framework of WW II organizations. Today's tactical air wing with F-105's has a U.E. of 72 aircraft as compared with the 75 U.E. in WW II fighters!

19. Thus, there appears to be a growing tendency towards conservatism throughout the USAF. With the general recognition of the dominant role of Air Power, following World War II, the Air Force's reputation as the source of young and new ideas on organization tactics, and defense policies has steadily declined. There is a status quo attitude in the officer corps - a growing tendency to hold what we have rather than risk untested organizational or doctrinal changes. It is

THIS PAGE IS DECLASSIFIED IAW EO 13526

reminiscent of our Navy's attitude towards battleship and cruiser divisions in World War II. The Army with its recent reorganization of the basic divisions seems to be taking the lead away from the Air Force in forward thinking.

The Curse of Bigness

20. Unfortunately, the growing conservatism and increase in overhead noticeable in the Air Force these last few years is not merely a question of attitude. Air Force leaders in both technical and operational fields would be the first to disclaim any intent to impede progress or oppose change. The real culprit appears to be the "system" fostered by bigness and overcentralization.

21. Managerial perfectionism, superior administration, and overcentralization are inherently in conflict with economy and with organizational and doctrinal flexibility. The more efficient a large business is the more rigid it becomes. Changes of substance can only be made at the risk of upsetting carefully prepared procedures, plans and/or requirements. The specialists, in our services, who have spent years perfecting these systems do not take kindly to their being upset. Thus potentially brilliant operational or organizational advances and suggestions for savings through local initiative are all too often vetoed by higher staffs who will not, or cannot, readjust their areas of responsibility to accommodate the resulting changes.

22. More wars and battles have been won or lost by the quality of the leadership than as a result of the administrative standards of the opposing forces. War, itself, is inherently inefficient. "It is an impassioned human drama not a science or an art." (Jomini) The types of decisions which lead to victory cannot be made by mutual agreement within staffs and committees. Commanders must be free to seize opportunities and exploit them. Organizations, tactics, and plans must be constantly revised if we are to get the most out of modern weapons. With the prospect, if not certainty, of short atomic wars, these revisions must be made in peacetime.

23. Over perfectionism in Air Force administration tends to make it too difficult for commanders to modernize their forces. For instance, our manpower experts have classified every officer and airman to such an extent that even a minor change in the make up of basic units, in any one command,

THIS PAGE IS DECLASSIFIED IAW EO 13526

upsets personnel procurement, training, and budgeting throughout the Air Force. Likewise, budgeting and procurement is so efficiently centralized, programmed, and planned that lead time in years, is now generally required before we can change the type, or number, of units in the air order of battle. It would be interesting to know how the U. S. Army dealt with this problem in their recent reorganization to the pentomic division.

Overcentralized authority?

24. Few constructive decisions are left to Wing, or even Air Force, Commanders, not because these men cannot be trusted to make proper decisions, but because managerial and administrative perfectionism demands increasing standardization and higher headquarters have taken more and more control from subordinates. This results in rule by regulations, manuals, and directives prepared by higher staffs who are all too frequently uninterested, or unfamiliar, with the local situation. The average fighter wing base commander today has ninety-six volumes of regulations, manuals and directives to tell him how to run his station. The resulting rigidity kills command initiative, stifles new ideas, and leads to wasteful solutions.

25. A Wing Commander in one of our major commands summed up the prevalent situation by saying that he now had unlimited Negative authority. He could stop anything from taking place on his base, but he could NOT build a ten by ten brick shed, or make an unsatisfactory mechanic into a policeman, without the authority, or at least collaboration, of several staffs of higher headquarters. He is not only told what his mission is, but how and when he will train and equip for it. The tactical unit commanders have no latitude to introduce, or even test, organizational or operational changes of consequence. Nothing of substance that is constructive or positive is left to their decision.

26. If the above situation meant that higher, and hence, more qualified commanders were making the decisions, we need not be unduly concerned. This, however, is not the case in most instances. The condition seems to extend up through the service structure culminating in decisions being made by staff officers and civil employees, often junior and anonymous. This situation in the U. S. Services prompted Field Marshal Montgomery to once remark that the main difference in U. S. and

British staff procedures was that the Americans allowed the lieutenants to tell the generals what to do. In our system, too many important decisions are arrived at through coordinated staff actions which in turn produces, by its very nature, the lowest common denominator of staff opinion. Alternately, they are the personal views of the action officers in the higher headquarters. In either case, they lack the clear cut positive effect of on the spot command experience and judgment.

What is the Objective?

27. Maximum efficiency in each and every sub-division of the Air Force does not necessarily result in maximum effectiveness of the service as a whole. This is particularly true where there exists a relatively fixed manpower and budget ceiling at any given time. It is a fact, however, that is all to frequently overlooked.

28. The taxpayer wants the most effective organization and equipment obtainable to discharge the role of Air Power in national defense. In the broadest sense we can say that this role involves flying aircraft or missiles in furtherance of varied objectives. This being true, it is equally clear that efforts or improvements which either detract from this capability, or fail to contribute in some measurable manner towards it, are circumspect. It is theoretically possible to obtain superlative management and administration in all areas of the Air Force and yet not be able to fly a single sortie. Today there appears to be too great a tendency in this direction.

29. Attempts to achieve peak administrative efficiency in every sector of the Air Force can be wasteful when results are measured in terms of the ensuing ability to carry out the basic objective. While improvement for improvement's sake is fine, it requires effort and resources. These have to come from somewhere. All too often, the managerial improvements are paid for at the expense of new equipment and with manpower and effort withdrawn from operations and/or maintenance.

30. A certain wing was recently provided twenty-six spaces to initiate a base supply mechanization program. When implemented, these spaces were withdrawn, although no saving in personnel was realized by the program. The Command was then directed to man it from its normal resources - as a result, other functions suffered; and, particularly, operations and maintenance since this area is the least protected by regulations.

31. Far too low a percentage of Air Force manpower is in the tactical or operating echelon. Far too many people are devoting time and effort to matters which would never come to their attention were it not for the centralization of authority inherent in the search for superlative administrative efficiency.

32. This centralization of authority has two other detrimental by-products. It is not only wasteful in terms of the best use of fixed resources towards a stated objective; but it also hinders the modernization of our Air Forces, and, in addition, results in the loss of many qualified and highly trained men and officers.

33. Changes in tactics, doctrine, and organization can only be developed and tested by the units and commanders who have first hand knowledge of the capabilities and limitations of the new aircraft and missiles. If sound adjustments are to take place, the tactical commanders must not only have the authority to introduce and test these, but must be encouraged to do so. It now appears that in the interest of so-called sound management policies, higher headquarters have frequently, if inadvertently, discouraged and even prohibited commanders from making major adjustments at tactical level. Thus, progress is arrested by the combined impact of regulations that restrict the use of the initiative, and U. S. defenses suffer accordingly - all in the interest of good management!

34. As an example, it is clear that the cost, performance, and firepower of fighter aircraft have gone up in hundreds of per cent over World War II models. The related organization structure and strength of the basic unit, the group or squadron has hardly changed. There is something illogical in this. I know commanders who have repeatedly suggested changes in the strength and basic organization of certain fighter units, and I suspect that the "system" is responsible for the limited progress made.

Administrative Efficiency Does Not Like Change

35. The Air Force is losing highly trained young officers because our system will not allow them to shoulder responsibility commensurate with their training and ability. Participation or interference by higher staffs frequently leaves them no initiative and little authority. To illustrate, a graduate engineer at Air Force level is not trusted to determine if a new structure, even a garage, should be

0692

accepted by the Air Force. Under existing policies, installation staffs representing several higher headquarters foregather to do this at some cost in travel and man hours to the taxpayer.

<u>What to do about it</u>

36. It seems quite clear, from the wing level, that administrative and managerial perfectionism is being over emphasized. While necessary in a democracy, and proper in big business, it is not the sole increment of a perfect military establishment. In any military force, improvements in administration should not exceed the point at which their cost is greater than their resulting contribution to the basic mission of the Force - the aim should be <u>Not</u> overall efficiency, but the best combined application of all resources towards maximum efficiency in the basic objective.

37. Some centralized control and a reasonably high level of managerial efficiency must of necessity be maintained regardless of its impact on modernization of the forces or on operational effectiveness. This need stems partly from congressional pressures, partly from interservice competition, but mainly from the very nature of democratic government in peacetime. I, for one, believe, however, that the military should Not go overboard in this direction as now appears to be the case. While radical surgery is not indicated as yet, positive steps to reverse the trend should soon be considered.

38. If we are to correct a condition, we must first agree as to the cause. In this case, I suggest that one fundamental cause of excessive centralization, specialization, and administration within the USAF lies in the almost total delegation of authority in internal administration to staff divisions and committees. These by their very nature each represent some particular segment of administration and/or operations. Without overall responsibility they can hardly be expected to arrest progress in their particular field on grounds that the improvements are not justified in light of overall objectives. This is a function that requires Command attention at every level.

39. A first step towards insuring the best possible air arm would be to organize the command section at each level to insure that one individual therein can devote full time and attention to his internal administrative problems. Overall direction, from a commander's point of view, must be re-established. The Staffs must be in fact, and in name, staffs,

rather than each staff division assuming a command role in its particular field. The present trend wherein subordinate staff officers now look more to their counterparts in higher headquarters than to their immediate commanders for guidance, direction and reward, is detrimental to efficient command and contol.

40. A second step towards a more healthy, and decentralized administration, would in my opinion, consist of a forceful reiteration of two generally known though largely discarded principles. First, the principle that all commanders will be expected to make decisions which are within their capabilities; and second, that all messages, of any sort sent from one headquarters to another will be construed by the commanders concerned as specifically addressed to them. A third and related measure would be a review of all regulations and directives - by an ad hoc board of commanders, not staff officers - to eliminate all those which violated the first principle above.

41. I have frequently questioned commanders at various levels and have yet to find one who has ever had a query on any subject returned by a higher headquarters with the comment that he, or his staff, was considered competent to deal with the subject matter. On the contrary the tendency seems to be to solicit from subordinates requests for guidance and decisions, wherever these are not already reserved by regulation to the higher staff sections.

42. The second principle that we propose, direct association of messages with the commander's concerns, aims at eliminating the command-subordinate relationships between staff heads at one level and their counterparts above them. A review of signals in and out of any headquarters, in light of the above principle, would, we think, cause some commanders to question their worth. It would produce an amazing number of messages from Headquarters A to Commander B whose wording or subject matter would never clear either headquarters if they bore the by-line "personal from General A to General B." Yet, in military correspondence, this by-line is, and should be, implied at least in all signals criticizing or directing an action.

43. While corrective action is difficult, the situation is by no means hopeless. The first step is to recognize the existence of the problems and the evils of overcentralization of authority and/or administrative control. Next, collective efforts on the part of Commanders, and cooperation

0694

by senior staff officers - who were or will be commanders, seems indicated.

44. The first goal should be the revision or elimination of regulations that reserve a power of decision on any matter to a level at which the decision will, in practice, be made by individuals junior to and less qualified than the Commander affected. The excuse that staff officers at higher levels are better qualified to decide because they "have the big picture" is, generally speaking, utter rot. Where centralized control is indicated to maintain overall balance, then the Commanders making decisions can be directed to report the action taken. The higher headquarters staffs would then monitor the actions, instead of approving them, and bring to the attention of their own Commanders areas of concern where redirection to subordinates seemed indicated.

45. A second goal should be the elimination of the Commander-subordinate relationships between staff chiefs at any level and their counterparts at lower levels. Staff officers should look to their Commander for decisions and policy guidance. Anyone who would dispute this, challenges the entire philosophy and concept of military command relations. A first step to achieve this goal is to eliminate the control by special staff chiefs over the assignment and/or ratings of subordinates in their field. This is a function of personnel and should never be delegated as is now the case in some commands. A second step must be insistence on the part of all commanders that their staffs look to them for guidance. If they allow themselves to be constantly bypassed, they lose both authority and control while still retaining responsibility.

46. Correct relationships are as depicted on all recognized organization charts - from one Command to another. In the last few years there has been a growing tendency towards a relationship which puts Commanders off in left field, observing and coordinating directives and policies flowing directly from staff chief to subordinate staff chief. This tendency is detrimental to the ultimate effectiveness and growth of Air Power. It results from the paralysis of initiative and authority created by overregulation. It leads to all levels losing sight of the main objective - Air Operations - while redoubling their efforts in administration, and it produces waste in both manpower and money.

Specific Actions to be Considered

47. In summary, the most effective cure for current trends towards overcentralization - and means to make real savings in overhead costs and manpower - is to conduct a drastic "shake out" directed from the top. The main characteristics of such a "shake out" should be:

a. Decentralization of authority at all levels.

b. Reiteration of some classic principles of Command and Control to include:

(1) Decisions to be made at the lowest level having all the facts, with unnecessary referral being criticized instead of encouraged.

(2) Failures and shortcomings to be charged primarily to the responsible officers, not to inadequate regulation. Corrective measures to emphasize discipline, not additional regulation.

(3) All communications between headquarters to be viewed as if "personal" from Commander to Commander. This prevents a staff section from indirectly criticizing a subordinate commander.

c. Follow (b) above by a major review and reduction in regulations, directives and manuals. No Commander should be subjected to more regulation than he can reasonably read and personally understand.

d. Reorganize headquarters, wherever possible, to reduce the span of control. Since 1947 Headquarters USAF has gone from: 4 to 6 DCS's; 4 to 10 ACS; 4 to 13 DCS special assistants; and from 12 to 25 Directors. The odds are the same is true in all other headquarters.

e. Ask Congress to accept occasional delays in obtaining information on personnel problems, etc., in return for economies through decentralization. They will agree if told what areas are involved.

f. Give Commanders more latitude in operations, in the hope that those with initiative will develop, test, and make known new uses, or organizational improvement, for new equipment.

g. Eliminate or reduce to a minimum "protective" regulations for special categories of people; i.e., why should chaplains assistants be exempted from a force reduction when crew chiefs are not?

AN APPRECIATION OF THE RELATIONSHIP BETWEEN GENERAL WAR, LIMITED WAR AND COLD WAR

THIS PAGE IS DECLASSIFIED IAW EO 13526

AN APPRECIATION OF THE RELATIONSHIP BETWEEN
GENERAL WAR, LIMITED WAR AND COLD WAR

WHY THIS PAPER WAS WRITTEN

This paper has a single purpose, which is to foster greater unity of effort in defeating world communism, through better understanding of the relationships between general, cold and limited war.

Wide differences of opinion on vital national security matters are being expressed repeatedly. There are many misconceptions about the relative probabilities of general and limited war and the urgencies that are imposed upon us by each threat; the principal reasons for the intensification of the cold war often are not understood; and there are many questions about the effectiveness of a deterrent strategy in the future. The continued clashing of opinion threatens to degrade the credibility of our deterrent strength in the eyes of friend and enemy alike.

It is hoped that this paper will have various uses in eliminating some of the misconceptions that cause trouble and preventing new ones from developing. It is emphasized that in its existing form it is intended primarily as a reference paper, providing basic information which may be processed in a number of ways for different specific uses. It is considered also that on appropriate occasions it may be used in its entirety as an informational package. It does not purport to offer solutions for the problems of general, cold and limited war. However, its objective is better understanding of the conditions of conflict which these terms denote and of the effects of the interaction between them; and if progress can be made toward this goal of better understanding, then greater unity of effort in designing and preparing for the best solutions in general, cold and limited war will be enhanced.

The paper is entitled "An Appreciation Of The Relationship Between General War, Limited War and Cold War." Appended to it is a summary

relating specifically to distinctions between general war and limited war. Both are drafts. Your suggestions for improving them and for using them effectively will be appreciated, because if the relationships are not understood fully by those whose opinions are influential, it is possible that we could see fundamental changes in basic national security policy which we would consider ill advised, even dangerous, and certainly of greater import to the welfare of the nation than many questions (now claiming much attention) which relate to specific weapon systems such as Polaris and Minuteman.

THIS PAGE IS DECLASSIFIED IAW EO 13526

AN APPRECIATION OF THE RELATIONSHIP BETWEEN GENERAL WAR, LIMITED WAR AND COLD WAR

THIS PAGE IS DECLASSIFIED IAW EO 13526

Until the communists change for the better, we must continue on the assumption that they will exploit every possible form of conflict as fast and far as they can in the constant war they are waging to conquer us.

We must consider that if they should become confident that they could quickly gain their ambition of world domination by nuclear attack, they would take that gamble.

If they should feel that they could make sufficient gains in localized armed aggression without too much risk, they indicate they would try that course.

Every day there is new evidence of their efforts to demoralize the Free World and isolate us through cold war actions.

There are few if any who doubt that we must make the total effort necessary to defeat the communists in any form of conflict. However, unanimity goes little beyond that point. Thereafter, with reference to decisions about the kinds of military forces we should build and how we should use them, there are many differing opinions, both official and unofficial. It is disturbing that these divergencies seem to increase with the increasing complexity of the constant conflict.

Some who speak up are adherents of "city busting." They believe we should be willing to accept the critical risk of having a limited or minimal strategic capability, patterned primarily for the purpose of attacking the urban centers of the enemy. Others advocate a countermilitary concept, believing that our security will be a lost hope if we do not have strategic forces intended primarily to destroy the enemy's military capacity, which is the immediate and direct threat to us.

Some believe that because nuclear war would be so fearful for

all concerned, the USSR and U.S. could be mutually deterred from using their best weapons. In their view we should, as a consequence, prepare to fight "big" conventional wars with the USSR and therefore should assume the heavy burden of maintaining larger ground forces. Others believe that committing ourselves to so challenge the numerically superior ground forces of the USSR and other communist nations would be a major blunder and would put us at a critical disadvantage. Their view is that by thus letting the communists know that we intended to fight them with major advantages on their side, we would increase their confidence and do more to _invite_ war than to deter it.

Some believe that military forces have an extremely limited role in cold war. Others are convinced that they have a great potential which we can and must exploit in an affirmative strategy to stabilize the Free World and reduce the incidence of communist-backed trouble.

With opinions pulling in many different directions, the relationships between general, cold and limited war are often forced out of balance. One reason for this difficulty is that the controversial discussions have a way of focusing on only one form of conflict. . . limited war, for example. . .and dealing with it as if it were something separate and apart from general and cold war.

This process invites faulty conclusions. To get an accurate fix on limited war as a threat, we have to understand _why_ the threat is what it is. If we look upon it as prima facie evidence of communist initiative and advantage, we are sure to see it in large proportions. However, if we look upon it as a condition which _we_ have created through deterrence of general war, and in which we hold the major capability, we will see it in more accurate perspective.

Understanding the interaction between the different forms of conflict calls for the most careful examination, which inevitably

must begin with the primary threat of general war. For example -

- In what ways does our general war capacity affect limited war and cold war?

- Is limited war more likely or less likely because we maintain a strong strategic deterrent?

- Does the danger of general war diminish if limited war becomes more likely?

- Does our general war capacity cause the communists to work harder in the cold war field, or does it discourage them?

- Could there be general war without immediate nuclear attack on the United States?

* * * *

General war is a term which denotes the most violent form of conflict. It means the form of conflict having the most critical impacts on the participants and others. Therefore, it encompasses the ultimate that is possible within the military technology at a given time.

The United States and the USSR are the only two powers which today could wage war at the highest possible intensity. Should they become involved in any kind of hostilities, both would have the technical capacity immediately to extend hostilities to the ultimate in weaponry. No matter what "limited" intentions might exist on either side at the initial moment of hostilities, this mutual capacity to expand would make them general enemies.

For the foregoing reasons, general war, as of today, can logically mean only <u>armed conflict between the USSR and the United States</u>.

Obviously the current situation will change in time. Other nations or treaty organizations or groups of nations for collective security may develop or acquire strategic systems of potentially decisive proportions. Then they will have the technical necessities

to wage general war. However, for the time being, the United States and the USSR are the only ones equipped sufficiently to wage war at the highest intensity possible with the weapons thus far developed.

In its highest intensity, general war would begin with massive nuclear attacks launched almost simultaneously by the USSR and the United States against each other.

This is the way general war is thought of most often. . .surprise attack launched against us; massive retaliation from us.

The possibility of general war in this form is the gravest threat. It would promise the greatest returns to the USSR as the attacker. It would offer the best chances for them to strike our cities and industrial and military targets which they assessed as vital objectives. They could expect to cause widespread devastation, with casualties into the millions. In their own country they could take precautionary measures beforehand to brace for our retaliatory attack.

Since general war at extreme intensity is the gravest danger threatening the United States, it is the contingency which rightfully levies priority claims on our military resources and planning.

It is the maximum threat for which we must be fully prepared at every moment. It is where we must keep the risks of not being prepared at the lowest possible level.

It is the continuing peril which should principally influence military developments in the proximate future.

It is not, however, the sole manifestation of general war, the only way in which it could occur. It is important to consider that the circumstances of conflict could be sufficiently flexible to permit the war to originate and develop to a climax under different conditions. The possibilities for variations of the conflict also must be examined; and they are considerable.

While it is true that a condition of general war would exist immediately if organized forces of the United States and the USSR should be brought together in armed conflict as the result of deliberate strategy, there are no inflexible circumstances which would dictate in every such instance that the next action of either side would be to launch massive nuclear attack against the other's homeland. It cannot be considered that for either the United States or the USSR the immediate response to every directed encounter everywhere must be only in for form of massive nuclear exchange. There are many reasons why the national interests on both sides might dictate differently as of the moment of decision, so that the condition of general war could begin and possibly be resolved at some level below its climatic intensity. (Khrushchev himself has illustrated this point in indicating that the USSR would be loath to risk the consequences of initiating sudden nuclear attack on the United States in support of Cuba. There is little doubt that attempting to "save" Castro by this method, at the cost of retaliatory attack against the USSR would be a prospect of questionable attraction for the Soviets.)

The very nature of the constant conflict with the USSR and the others of the communist empire indicates a variety of possible general war conditions. The interests of both the United States and the USSR come into conflict everywhere. In this atmosphere of competition each must pursue a dynamic strategy and be prepared even to take great risks when the stakes at issue are sufficiently high. It is possible that representative military forces from each side could meet in armed conflict, thus originating a general war condition at a lesser intensity. This could occur as a single instance, or it might involve more than one conflict occurring simultaneously or in series.

These situations should not be prejudged nor considered as inevitably resulting in a massive nuclear exchange. In actuality, the measures taken would be decided by the President in the light of all

the circumstances. What should be prejudged, however, are United States strategy, force strength and preparedness for the ultimate response if it should be necessary. Since the ultimate could be required, the means for it must be fully provided. Failure to do so would impose unacceptable limitations as to the decisions which would be open to the President, from a military standpoint, in a general war situation.

Under such conditions both sides would have periods of warning and time for preparations beyond any that appear probable in the case of a war initiated at the highest intensity. Both would have time for a choice from among optional courses of action, including sudden attack against targets considered to be the most vital at the time. Optimum passive defense measures might be possible, greatly reducing civilian and military casualties.

As for the likelihood of general war, it is indicated that conflict originating at the highest level, with massive strike and retaliation, is the least likely, although undoubtedly the most dangerous. We must be careful not to allow it to become less dangerous for the USSR and therefore more likely than it is now.

It should be self-evident that the primary reason for such a situation being not likely is the nature of our military posture and the state of our preparedness. Weaken our posture---or weaken the indications of our certain response---and the likelihood of general war goes up proportionately.

* * * *

We say we must have a winning strategy.

Our concept for defeating the USSR in general war is the counter-military concept.

This concept holds that military victory can be achieved only when the enemy's military forces have been defeated or rendered

ineffective, while at the same time the United States is protected so that it survives as a nation and as the dominant national power.

The countermilitary concept, therefore, is our basis for determining the strength we must have to win if deterrence fails. Our over-all strategy, and our programs for providing the major forces with which to fight according to the strategy, both must stem from it.

The so-called "city busting" or minimum deterrence concept, mentioned earlier, is advanced by its sponsors as an "economical" substitute for the countermilitary concept, their argument being that since cities are fixed targets in known locations it would be cheaper in terms of forces and effort to destroy them rather than the enemy's military forces.

We would have minimum hope of deterring the use of force by the USSR or of winning with a force able to attack only the enemy's cities but incapable of effectively attacking his fundamental military capacity. This would, in effect, make the enemy a gift of survival for his nuclear strategic forces. He then could use these forces in repeated attacks against our reduced forces and our cities and people to destroy our will and capacity to continue the conflict. True, he might lose some of his most important cities in the process; but if his major strategic forces remained intact, and we had exhausted most of ours, he would hold the decisive advantage. And there's little doubt that if the communists should conquer the United States, all the cities of the Free World would be theirs for the taking.

To provide our countermilitary capability the offense and defense must be linked in the closest possible coordination to prevent or minimize damage to the United States. The objective is to destroy as many enemy offensive forces as possible before launch, to intercept others in transit, and to minimize the impact of those which do penetrate.

Admittedly, a countermilitary strategy is difficult. But the difficulties do not diminish the necessity. The difficulties are insurmountable only if we concede them to be so, and we must not make such a concession. The alternative of not countering the enemy's fundamental striking capacity would virtually amount to guaranteeing the destruction of our own major cities, or setting up a situation that would be ready-made for nuclear blackmail through the threat of destruction of our cities.

As would be expected, the effectiveness of countermilitary operations would vary in proportion to the manner in which general war would develop. The difficulties inherent in the task would be less acute if general war should originate at an intensity lower than the extreme intensity of sudden attack and retaliation. It is possible even that the conflict could develop so as to permit a considerable amount of target reconnaissance and other preparatory measures which would enhance the effectiveness of our own attacks and alleviate the impacts of the enemy's blows.

The constant outreach of weapon systems in both the offensive and defensive categories is adding to the countermilitary capacity. The developments that are in prospect in advanced aircraft, missiles, missile launching submarines, and spacecraft bring the offense and defense to the point of realistic as well as conceptual indivisibility as a global instrument. The different weapons can be used more fully as one. Thus directed, they can be employed against the enemy faster and with greater assurance of attacking the most critical targets at any given time.

Some of the systems that we can expect to be available in the relatively near future will be able to function in both capacities if it would be advantageous. Instrumented earth satellites, for example,

could support either function. They could supply information which could alert the defense system and at the same time supply information which would confirm the location of suitable targets for the offense, or reveal hitherto unknown targets which could be attacked to reduce the threat to us. They could supply communications and navigational aids for both functions. The SAMOS and MIDAS satellite developments (for aerospace reconnaissance and warning respectively) illustrate this potential for further improving the offensive-defensive relationship. The advantages that would accrue from an anti-ICBM system are obvious. There is no way to forecast how fast developments will come, but it is certain that science and technology will continue to provide better ways to keep the enemy under observation, to enhance survival against his attacks, and to hunt down and destroy his forces.

One of the least recognized but most valid and compelling reasons for a countermilitary capability is to give credence to our strategic commitments to our allies. Looking at circumstances from their point of view it is understandable that a certain measure of uncertainty could arise as to the credibility of our strategic response to an attack on an ally (but not involving an attack on the United States.) As they see us arguing and considering something less than a countermilitary capability it is not surprising that they become concerned. If we should settle for only a massive response "city busting" strategic force, it would be obvious that it would be used as a counter to attack on the United States, but not necessarily in case of attack on an ally.

The necessity for us to have the countermilitary capability also must be considered in the light of the principal strength on the communists' side which must be countered. It is offensive strength for general war of the highest intensity.

It is significant that the USSR is not building its strategic striking forces for the purpose of deterring attack by us. We can

be sure of this fact because there is no reason for them to build forces for such a purpose. No one threatens them with invasion or unprovoked attack. So. . .unless we are to recklessly ignore the facts . . .we must assume that they are building their great striking power as an offensive instrument, and that it is designed primarily for use against the U.S. and our principal allies.

It would be less than realistic to assume that this strength would not be used for its primary purpose if we should do anything to make war "easier" and less dangerous for the communists and thus permit the critical advantage to shift to their side. Our major deterrent power consists at present of some 2000 long range bomber aircraft, an initial unit of land based intercontinental ballistic missiles, and a missile launching submarine. However, the dangers of general war impose such stringent priorities for the concentration of resources and effort that all delivery systems other than the strategic systems would also be employed, as needed, in general war of any intensity. It is inconceivable. . .considering the stakes at issue. . . that any combat system which could have a direct effect toward defeating the enemy would be withheld from commitment in general war. Certainly any major weapon systems that would be unduly restrained by their design from making a substantial contribution to the winning of general war would be suspect and open to the most serious question, unless the basic requirements for general war had first been fulfilled in all respects. Forces so limited could be justified only as additive forces, never as substitute forces. Preparation for the worst possibility must always have priority.

* * * *

Despite the fact that general war is the gravest threat to us, some individuals still hold the opinion that limited war is our most

urgent problem and therefore demands more of our attention, effort and money than it now receives.

These opinions often appear to have been influenced by the outlook that armed aggression in some other form is more probable than general war.

There is little reason to doubt that lesser armed conflict is the more probable of the two. We have made it more probable by making general war more improbable. If our nuclear strategic capacity is such that the communists cannot afford to chance general war, they are forced to pursue their goals through lesser forms of conflict. Hence increased emphasis on limited and cold war. Certainly we would not want it to be the other way around, with general war being the more likely.

It would be a fortunate situation if it could be said truthfully that because limited war is more probable than general war, the danger of general war becomes less. This is a popular wish. But---because of the nature of the communist threat---it does not work out that way.

Greater emphasis on our capability to conduct limited war does not deter general war.

The general war danger does not diminish as the limited war probability goes up.

Limited war is not a substitute for general war. Indeed, every limited war is in itself potentially a general war, because the course of none could be predicted with certainty and absolute controls to keep them from expanding are impossible.

There is nothing to indicate that the fighting of limited wars would cause the communists to be diverted from their principal ambition to defeat us completely. On the contrary, it must be assumed that as long as they are dedicated to waging constant war to conquer us, we could

fight a dozen limited wars and they would still be as determined as ever to destroy us quickly in general war if they should be able to gain a sufficient advantage over our strategic nuclear forces.

If this is so, it would be a dangerous fallacy to believe that the problem of general war could be "solved" by committing greater portions of our strength in limited type wars, with battlefield manpower and non-nuclear weapons as the principal determinants.

Obviously the communists, with their greater manpower resources mobilized, recognize their potential for advantage over us in conventional type limited wars. However, this is not to say that they ever would deliberately reduce their priority general war capacity and divert extra resources into increased preparation for lesser conflict. It is patently implausible that they would forego or abandon a military space system, or a strategic missile, in order to have another ground division or two for limited aggression. On the contrary, they are reducing conventional forces.

It's illogical to assume that we would do such a thing either, because we must always prepare _first_ for the worst danger. Moreover, the currently increased emphasis on the limited war threat does not result basically from a deficiency in our limited war capabilities but from the effectiveness of our strategic nuclear deterrent. Over the next four years we could spend the approximately $757,000,000 it would take to provide and maintain three more infantry divisions for overseas tasks and this extra expense and effort still would not have made it possible for us to do anything militarily against the limited war threat that it is not possible for us to do now. It would not, for example, halt communist infiltration of Cuba, or slow them up in relation to the Congo, or cause them to stop pushing for greater influence in the Middle East and Southeast Asia.

With all of the opinion that is being expressed, it has become evident that everyone is not talking about the same kind of "limited war." Thus a great amount of confusion has been created as to what limited war really is and what it demands of us in the way of military forces, budget considerations and other preparations.

Much of this confusion is unnecessary. The meaning of limited war can be stated as precisely as the meaning of general war.

It was stated earlier that general war is armed conflict between forces of the USSR and the United States. So limited war must be something different. It cannot be the same thing.

With this distinction having been made, limited war then can be considered in its proper secondary classification of risk to our well-being. It is armed conflict which falls short of general war, _but in which the overt engagement of our forces is directed_. Tremendous variations in scope and intensity are possible.

This description removes from the category of limited war unplanned participation by deployed U.S. forces in localized occurrences such as incursions, communist inspired riots and other internal disorders. There remains, however, the question of unplanned or chance encounters between forces of the USSR and the United States. Will general war be the inevitable climax _every time_ they come together?

As a matter of practical reality it is to be expected that there might be times when the forces of the USSR and the U.S. would confront each other, and even make contact, and general war would not result.

This has happened in the past, particularly in air encounters, and it might happen again.

However, confrontations of USSR and U.S. forces would not be _planned_ encounters. They would not involve sustained engagements. They would not be brought about by a deliberate, directed strategy. Important military objectives would not be at stake in the immediate

actions of the forces concerned. And because of circumstances such as these, either side. . .or both sides. . .could have the option of withdrawing and breaking the contact in time to prevent the incident from increasing to a critical level of intensity.

Under such conditions it may be assumed that forces of the USSR and the U.S. could come into contact without general war resulting. But with the USSR possessing the means for conflict at the highest intensity, such occasions certainly cannot be considered as "limited war." They must be met with a general war strategy, even though general war might not eventuate.

It is pertinent also to observe that we cannot expect to state a meaning of limited war that suits the communists' views and our own, too. Different philosophies of conflict are involved.

They see conflict in all intensities. . .including limited military operations. . .as avenues for possible progress toward their goal of world domination. In essence, an opportunity.

We see conflict with the communists as a continuing threat against the progress of the whole world toward better conditions. In essence, a danger (but also, of course, as an "opportunity" to prevail over the communists.)

We know of no instance where the USSR has stated specifically that deliberate conflict between their forces and ours would or would not be a limited war or a general war condition in their view. There is no way to be certain as to whether they would see the same dangers in it that we would see, or whether they would see more or less.

Even so, we must have a clear meaning of limited war, so that we can know what to plan for and what not to plan for. So the distinction between limited war and general war is an important one. Knowing it, or not knowing it, could affect the kinds of judgments that are made

by many individuals as to what our strategy should be and what kinds of military forces we ought to have. And the cumulative weight of their opinions could affect the kinds of forces we actually have.

It could have major effects such as these because if we should accept the premise that we would consider engaging the USSR in limited war. . .if we should deliberately plan to do so. . .limited war could assume the proportions of an inflated threat. There is little reason to emphasize the range of difference between planning and providing for a "limited" war against the armed forces potential of the USSR and against the armed forces potential of, for example, a North Vietnam.

- "Limited" war then could become a "big" war prospect, influenced by the magnitude of the USSR's 2,000,000 or more ground troops.

- It could become a prospect of a long-duration conflict . . .possibly years of fighting.

- It could become a prospect of continuing heavy drains on our manpower. . .with increased draft quotas for military service.

It could become the prospect of even greater deployments of our forces overseas, occasioning additional heavy drains on our gold reserves.

- We could be urged to abandon current policies and design large increments of our forces for conflict on the World War II pattern.

It is vitally important to make the meaning of limited war unmistakably clear, so that the chances are lowest that the USSR would be enticed to risk a direct, undisguised venture with its own troops into this form of conflict.

- For us to accept a premise of deliberate limited war with the USSR (and to plan and provide for that kind of war) would risk

such an enticement to them. (They could conclude that with greater manpower and "conventional" potentials mobilized on their side, the decisive advantage would be with them.)

- For us to commit ourselves to fight a limited war in a certain way. . .only with conventional weapons, for example. . .could be such an enticement. (It would, in effect, inform the USSR that they had permission to exploit power from their 2,000,000-man ground force, their 800,000-man air force, and their 700,000-man naval force without necessarily risking general war.)

- For us to reduce our strategic nuclear striking power below the level required by the countermilitary concept (to a point where they could consider that they could "stalemate" us by blackmailing our cities) could be an enticement to them to venture into limited war with their own forces instead of proxy forces.

We must keep the pressures tight against the communists by keeping the risks for them high, not by making them smaller. . .by building stronger strategy, not by embracing weaker strategy. . .and not by tailoring forces to fight at a given level, so that the communist enemy could feel confident of being able to control the size of the conflict.

* * * *

Our concept for winning limited war is to be prepared to fight it with the weapons that are best suited to the military and political circumstances.

This means that nuclear weapons might be used if suitable targets existed. . .or that they might not be used, if the circumstances should not be appropriate.

It means that the communists could not be assured of the war

holding a course of their choice. They could not "control" the conflict and so limit their risks. They could not have the predominant initiative as to either the types of weapons that would be used or as to the magnitude of the conflict.

The validity of this concept is illustrated in the case of Communist China.

Fighting a large-scale, prolonged ground war against Communist China's hoards of foot soldiers obviously would not be the best method for us. Moreover, permitting such a conflict to become a prolonged struggle would be likely to involve increasing dangers of expansion to general war by the direct participation of the USSR.

Since any enemy of the United States in limited war would represent World Communism, and the USSR is the supporting strength of communism, it is inevitable that every limited war would involve the danger of affecting the interests of the USSR to such a critical extent that it would become general war by way of direct participation by the USSR. For this reason it is fallacious to assume. . .as some are constrained to do. . .that we could find a safe retreat from the perils of general war by turning the clock back to 1918 or 1942 and committing ourselves to fight limited wars with the outmoded combat techniques of World Wars I and II. On the contrary, it is evident that the likelihood of general war would be increased.

Moreover. . .with reference to war with a smaller country. . .we must consider whether it would be highly probable or remotely probable that the overt engagement of U.S. forces would be directed. We cannot know the circumstances of something that has not yet happened, but we do know today that in such a case the overt engagement of U.S. forces would be our third alternative.

We would hope, first, that the indigenous strength of the country against which the aggression was committed would be enough to defeat

their immediate enemy.

Our second alternative would be for the specific conflict to be handled by the United Nations, as was our position in the case of the Congo emergency.

Directing the overt engagement of our own forces in limited war would be the third course of action among the alternatives.

* * * *

It is the continued effective deterrence of general and limited war which now causes the communists to pursue their goals with lesser risks, in cold war. Accordingly, our deterrent is, in fact, a creative force.

This fact emphasizes the close relationship between general, cold and limited war. In fact, the interaction between them is so broad and complete that if one should be examined in isolation from the others---if only a single facet of the continuous conflict with the communists should be considered---the resultant conclusions would inevitably contain gross errors.

- How could we reach proper conclusions if we should think of our physical enemy in limited war in the massive image of the USSR (with which we would not accept limited war) instead of in the lesser image of those countries with which we would accept limited war?

- How could we be accurate unless we should think of our enemy in limited war as having relatively limited capabilities of his own?

- How could we reach accurate conclusions if we should consider that the conflict could continue as limited war if the USSR should deliberately send its troops into the conflict against our own?

The extent to which the communists could hope to employ limited war successfully will vary primarily with their assessment of our

general war capability and not primarily with their assessment of the forces that we might employ directly in limited war. (This would be different, of course, if we should indicate in any manner that we would fight limited war in a certain way, only with certain weapons, or without expanding it beyond a certain size. Then the communists could have the advantage of an assurance factor which does not presently exist for them.)

It will vary also with their assessment of our determination to use the general war capability as required to obtain our national objectives.

The record of their aggression by force in the past indicates that they do not fear the risks of limited war when they have reason to feel certain that they can keep it limited. (Our determination to employ the best weapons suitable to the political and military circumstances, and always to back up our actions with our general war capability, is a combination which now denies them this measure of certainty and can continue to do so.

It is probable that the communists would like nothing better than for us to relieve them of uncertainty as to their risks in limited war by committing ourselves to fight with a certain type of weapon and on a certain order of magnitude. But we must not permit them a choice in "controlling" the weapons or the intensity of limited war.

The moment we permit that, we have given them the initiative and with it the opportunity to turn cold war into hot war.

We must continue to deny them this opportunity. . .and if we do not, they will have the advantage of the ability to challenge us on their own terms.

We must maintain the creative force that we possess in our deterrent capacity.

It is our surest hope, our greatest assurance, of keeping the

conflict in the cold war field and out of hot war.

This is the area of conflict in which our greatest victories can be won. For this is the field where we hope that the free nations, in concert with each other, can make progress with an affirmative strategy toward composing some of the differences that generate and sustain the dangers of hot war.

Cold war takes place in an atmosphere that is more stable than that which would prevail during hot war. And it is in this atmosphere of stability that the best chances exist to work out adjustments, to reduce tensions, to make worldwide fears smaller and to achieve our national goals.

* * * * * * *

SUMMARY

WHY THEY ARE DIFFERENT---(General War at Lower Intensity
(
(Limited War.

* * * * * *

It is not considered inevitable that general war must begin with a country-to-country nuclear exchange---the sudden attack and immediate retaliation pattern. Therefore, it is considered, that general war could originate at some lesser intensity and conceivably could be resolved without resort to the ultimate condition of massive nuclear exchange. This gives rise to the following question: What is the difference between lower intensity general war (without massive nuclear exchange) and limited war?

* * * * * *

First Distinction

The general war condition is based on the capability of the participants immediately to conduct war against each other at the highest intensity possible with the available systems. In the case of the United States and the USSR this means nuclear munitions and intercontinental air and missile systems. (For example, if Communist China had long range offensive forces and nuclear munitions it also would be a general war power.)

The limited war condition obtains when the adversaries of the U.S. do not independently possess the means to attack the United States heartland. The fact that the USSR might be backing them up in various ways would not make them general war powers by proxy. But if the USSR should come in with its own forces in sustained operations, the conflict would cease to be a limited war.

In brief, there could be conditions of limited war and conditions of "controlled" general war, different in each case. In addition, there could be the condition of general war characterized by an initial nuclear exchange, country-to-country.

Second Distinction

Our responses and actions would not necessarily be the same in (1) a condition of lower intensity general war and (2) limited war. The following examples illustrate some of the differences:

General War	Limited War
Declare national defense emergency (involving possibility of attack against U.S. and calling for the highest state of preparedness.)	Might or might not declare national emergency calling for extraordinary measures as was done in the case of Korea (involving threat to peace of world through armed aggression, but not imminent danger of attack against the U.S.)
Implement all phases of military alert.	Augment overseas forces as necessary.
Activate Reserve and National Guard units with an initial general war capacity.	Alert selective reserves.
Put country on full-scale war footing; suspend all air and surface traffic not essential to national defense effort; initiate civil defense measures; possibly evacuate cities; suspend schools, many other normal activities.	Initiate limited redeployment, to position naval carriers and other selected forces for participation in the conflict.
Initiate overt reconnaissance over the USSR.	Possibly initiate an increased alert status.
Deploy naval carriers and other selected forces to best positions for carrying out their general war responsibilities rather than for participation in the immediate conflict.	No extensive civilian controls, etc., pending more serious indications of going to general war conditions.
Relocate essential functions at the seat of government.	Deploy CASF and STRAC if necessary. *
Establish controls to ensure the most effective use of resources.	Provide logistic and communications support for indigeneous forces; utilize pre-stocked supplies.
Fully man alternate communications systems.	
Maintain means of rapid communication with USSR.	
Emphasize determination to go to ultimate intensity if necessary.	
Place recovery units on alert.	
Deploy CASF and STRAC to areas best suited to general war requirements.	

*(To geographical areas involved in the limited war.)

BRIEF ON THE RELATIONSHIP BETWEEN LONG-RANGE MILITARY PLANS, TECHNOLOGY, COSTS, AND CONCEPTS

Staff Paper
AFXPD-LR
7 Mar 61

Brief on

THE RELATIONSHIP BETWEEN LONG-RANGE

MILITARY PLANS, TECHNOLOGY, COSTS, AND CONCEPTS

0730

THIS PAGE IS DECLASSIFIED IAW EO 13526

As a nation, we tend to adopt fixed defense concepts, fixed international commitments, and fixed levels of armed forces. This tendency is in direct conflict with a technological revolution marked by rapidly rising costs of defense. It is this conflict that influences, or should influence, all our defense planning.

What we can have in defense at any time stems from both technology -- the state of the art -- and cost, which generally determines quantity if not quality. How we use our weapons stems from either past experience in war or objective study and analysis in peacetime.

Failure to fulfill long-range force programs and plans can generally be traced, in retrospect, to a failure to equate properly hardware, costs, and concepts. In turn, this failure derives from faulty estimates of the extent of change necessary in one or more of these elements to obtain their optimum combination for an effective national defense. This failure is exemplified when we plan to use World War III weapons in accordance with World War II tactics and strategies; when we program general war forces, designed for long wars of attrition, in an era of short atomic conflicts; or when we assume that the targets selected for strategic bombing will also be the optimum system for space delivery vehicles to attack.

When we reflect upon military history, it seems to have been easier to change military hardware than military ideas and organizations. For example, the last U.S. cavalry charge

THIS PAGE IS DECLASSIFIED IAW EO 13526

was purportedly in the Spanish-American War; yet the cavalry was not disbanded by the United States until we were in World War II some 41 years later. Concepts, force requirements, and organizations have not kept abreast of technology.

Hardware is a relatively predictable factor by comparison to concepts. The new weapons we can have at any point in time principally depend on the rate of technological progress and is subject to fairly accurate projections insofar as general weapon types and performance are concerned.

Changes in concepts, on the other hand, are not nearly as easy to predict or adopt. While often triggered by changes in hardware, they normally originate in assumptions and opinions rather than in technical data. It is often argued that there is no sound basis, other than war itself, for changing concepts. Yet, today the opportunities to test conceptual, organizational, and tactical changes, as well as new weapons, under the relatively safe and controlled conditions of a small conflict are becoming few and far between.

Beginning with the great impetus given to military research and development in World War II, military hardware has increased in both cost and performance at a seemingly hyperbolic rate. The relative increase in cost, however, of each new generation of weapons, whose purpose generally has been to take over the role or activity of an earlier weapon system, has perhaps out-

distanced the increase in performance. We cannot say, therefore, that the military capability of each new weapon system has increased in direct ratio to its increase in cost.

The requirement for improved weapon performance has in part been a product of unanticipated technological breakthroughs in the over-all technological revolution in weaponry, but also, and perhaps more significantly, it has been a product of the constant need to keep abreast of a changing Soviet threat. For the past 15 years, both the U.S. and USSR have been engaged in a game of "handy handy up the broom" wherein each family of weapon systems seeks to overpower either its offensive or defensive enemy counterparts.

The development of weapons has also been accentuated by the manifold increase in military responsibilities, which range everywhere from additional international commitments to new weapon concepts such as space, BMEWS, etc. These new commitments have been generally added to existing military requirements, such as the DEW LINE, NATO defense, and so forth.

The net result of the inequality between the evolutionary tendency of weapons development and that of the concepts under which we use them is to generate a cycle in which military hardware changes while concepts and commitments tend to remain constant.

The national military posture of major world powers has historically gone through a series of cycles because techno-

logical advances in military material have invariably taken place at a steady pace. Military concepts, on the other hand, have generally remained constant over long periods of time or have changed only as a result of lessons learned in actual war.

Under ideal theoretical conditions, concepts should automatically evolve gradually with the advent of new and more costly weapons. In practice, however, it is economic considerations that have forced changes wherever they have occurred between wars.

- First, materiel changes steadily and costs go up, while quantity requirements -- based on fixed concepts and doctrines and fixed commitments -- tend to remain constant.
- Next, budget ceilings lead to force and weapon reductions, to stretch-out in procurement, and to the reduction or elimination of future systems such as the F-108. "We sell our life insurance policies in order to keep our antiquated standards."
- Finally, the increased costs and new weapons are accommodated through an "agonizing reappraisal" of concepts or commitments.

Adjustments in concepts to take full advantage of technological progress is the "key" to having modern weapons with an effective defense at an acceptable cost. Conversely, adding

THIS PAGE IS DECLASSIFIED IAW EO 13526

new weapons to classical or reactionary concepts leads to more and more expenditures for a less and less effective defense.

Thus, an understanding of the role that changes in concepts - the method of waging war - play in the cost and effectiveness of a defense effort in any time frame goes a long way toward explaining many of the current controversies over the adequacy of our defense effort. Specifically:

- Those who wish to add the new weapons to classical methods of waging war will always claim the current effort to be inadequate, since rising costs have resulted in a steady quantitative reduction of forces contrary to the classical idea of mass.
- Those who understand the need to change concepts along with the advent of new weapons accept force reductions as reasonable and proper in light of the changes in the nature of war as they see it, and can even foresee more reductions.

Long-range national security planners are like ants riding a log down the river. If they all paddle on one side they may steer the log toward one shore or the other. No amount of effort, however, will push the log back upstream very far nor can they beach it and take it to an objective inland even though both of these destinations are theoretically attractive. What

THIS PAGE IS DECLASSIFIED IAW EO 13526

happens in weaponry is controlled both by technological progress and unanticipated breakthroughs. The former is fairly predictable, the latter wholly unpredictable. Likewise, how we use our weapons (i.e., our future concepts and security policies) will be controlled to a large extent by military, economic, political, and public opinion factors. These are the banks of the river that we must take into account when we chart the course for our defense activities.

Several examples of broad security planning concepts which may be considered as achievable or unachievable merit our attention. A long-range plan which recognizes the rising costs of weapons, the increasing importance of space in the international power equation, and the growing desire of Allies for an independent nuclear defense capability may be considered achievable. Such a plan could be plotted within the course of the river.

On the other hand, a plan which ignores the atomic weapon, which seeks to return to conventional forces (notwithstanding the cost of modern weapons), which presumes that European nations will be willing to fight WW III on their soil in order to prevent America and the rest of the world from being destroyed by nuclear attack or other devices, lies well outside the banks of the river. You might make a perfect case for such a plan. It would, however, be a school solution. For weapons capabilities, economic factors, and political trends oppose such

options. Even if we could change these inhibiting factors (or move the banks of the river), we would probably lose in the long run, since we would have been overtaken by a new generation of weapons and power relations. The net effect of implementing such a plan probably would be to beach the "Ship of State" on the rocks along the shore, while our enemies moved rapidly downstream ahead of us toward space or some other more awesome objective.

In conclusion, if we accept the fact that technology is indeed moving forward and giving us ever-improving weapons, then there seems to be no escaping the companion conclusion that we must devise a system in which hard decisions can be made repeatedly to readjust military concepts and commitments to conform to the costs and capabilities of the emerging weapons. The only other alternative, in the long run, is to stop technological progress.

Some Comments and Views on the Planning Process

1. Essential to effective planning is prior research, reflection and originality. The majority of the planning staff, however, are constantly faced with a variety of every-day requirements which require resolution in a very short period of time. If the organization and modus operandi of the planning effort is designed to concentrate principally upon these every-day requirements, then little time, or staff effort, is available for research or reflection.

2. Our planning organization has become a captive of suspense dates on both JCS actions and staff studies. Every action seems to be a "crisis." When this occurs the planning environment becomes "inward-directed" and "inward-oriented". Coordination becomes an "end" in itself. New ideas and new concepts are stifled. Preservation of the status quo becomes almost sacrosanct and conservatism becomes the dominant philosophical norm.

3. Based on 10 years experience in JCS, Hq USAF and NATO strategic planning and policy work, it seems to me that there are certain basic criteria by which a Plans and Policy organization should periodically evaluate its effectiveness. These might be termed "The Protocols of Sound Strategic Planning and Policy Development":

a. Emphasis commensurate with importance

b. The definition of the problem

c. The identification of the purpose

d. The direction of the effort

e. The adequacy of research

f. The exploitation of the product.

4. An analysis of recent trends in the Air Staff suggests that a return to procedures which adhered to these criteria could possibly, save manhours, improve

THIS PAGE IS DECLASSIFIED IAW EO 13526

morale and effectiveness, and permit time to be devoted to additional problems. Let us examine present trends in light of these criteria.

On Emphasizing the Important Considerations

5. One of the most prevalent difficulties in large staff organizations is the sense of "urgency" which seems to grip all tasks. Relative values are distorted out of proportion to the specific tasks involved. A minor problem in which top level interest is indicated frequently triggers off a staff effort completely out of proportion to the importance of the problem or its solution. Such actions impinge upon efforts being devoted to really substantive questions whose solution does not appear at the time to be quite so urgent.

6. While deadlines must obviously be met, judgment is essential in the assignment of priorities to the staff efforts devoted to the various problems. We must constantly consider the value of the problem and its solution to Air Force objectives as a whole. This difficulty is intensified by the numerous levels of review of an action officer's work with their concomitant increase in suspense dates for each level of review.

7. Considering some specific examples we find evidence of the "snowballing" of suspense dates on requirements which range everywhere from answering a one page personal letter for the Chief of Staff to defining the Air Force's role in Cold War strategy. On the other hand, we find investigation of such major problems as the Air Force's ability to sustain a "conventional" war, versus that of the other Services, receiving little or no attention because it does not appear to be a current issue. Yet, its solution would have a tremendous impact on Air Force roles and missions, on the Air Force's share of the defense budget, and on overall national military policy.

8. The priority of staff efforts, in keeping with the importance of the problem, requires the attention of supervisors at all levels of review before problems are referred to the staff for action. In practice, it would seem that many problems, particularly JCS actions, could either be dealt with by the chiefs at various levels "off the top of their heads" and without being staffed or else could be staffed quickly by one or two qualified specialists who would process them for general acceptance without detailed analysis. If this were done with those problems whose solution was not too important to the Air Force a good deal of effort could be saved at the working

THIS PAGE IS DECLASSIFIED IAW EO 13526

level and could be redirected toward a thorough study of more substantive issues.

9. The existing norm seems to call for a thorough and independent research effort for each JCS action. Because of the number of actions, both "thoroughness" and "research" are in fact frequently subverted by the pressure of producing "something." Naturally, successive reviewers find the initial effort unsatisfactory and thus embark upon solving the problems at their own levels. Suspense dates are slipped and the Staff soon finds itself in a continuous flap with one action officer occasionally encountering another action officer working on the same problem and both working under a cloud of mutual ignorance. A more valuable rule would seem to be the "quick treatment" for problems of little consequence to the Air Force in order to give greater attention to questions of real importance.

10. In this respect I do not subscribe to the argument that the Air Force position can be seriously jeopardized by the cumulative impact of a series of minor statements in secondary papers. This is the outgrowth of a tendency to do JCS planning by juridical precedent. It is unsound in principle and we can refuse to recognize, or even consider, this sort of evidence as an argument when the major issue of concern arises.

On Defining the Problem

11. It is frequently as difficult, if not more difficult, to define a problem as to solve it. There is some truth in the assertion that if a problem can be completely defined, the solution will naturally follow. In our present Plans organization it appears to me that supervisors at all levels do not devote sufficient time to defining the problems before directing the research and development of a solution.

12. The definition of the problem must be a joint endeavor between those who request the study effort and the action agency. In general, the directive or instructions outlining the problem should be sufficiently comprehensive so that the action agency can focus its efforts on the specific requirements of the problem with a minimum of diversionary effort in non-productive areas.

13. In JCS actions it seems to me that it might be possible to define the problems more effectively than we do at present. Key officers in Air Plans in the 1946 - 1949 era did this, the planner and action officer met and

THIS PAGE IS DECLASSIFIED IAW EO 13526

discussed every item on the agenda before any work was done. This no longer seems to be the practice. I gather the action officer reviewing a specific JCS paper, is seldom, if ever, told that he should concentrate on:

a. Factual accuracy.

b. Adequate and clear emphasis on airpower's role.

c. Attempts by other services to use the paper to pre-judge other actions, or

d. The possibility of twisting the paper into a useful instrument to support some other, or subsequent Air Force objective.

e. Etc, or all the above.

14. While it could be argued that all of the above objectives are germane, I question if this sort of unlimited mandate normally produces the best overall results. It seems that all too often we find that one of the above purposes becomes over-emphasized at the expense of the real problem that the JCS paper is trying to solve. As a result, serious inter-service debates occur on some rather insignificant elements of problems to the probable detriment of the whole. Continuous repetition of this sort of negotiation contributes to an inter-service milieu in which the really major issues of military policy become insolvable by the military negotiators.

__. The orientation of the respective Service planners becomes one of distrust and suspicion.

__. "Means" become "ends" with the machinations of negotiation becoming the paramount influence in the processing of JCS papers.

__. Planners become "word mechanics" to the exclusion of military matters of substance.

__. Service positions become inflexible and final resolution of major issues either are couched in almost meaningless generalities or referred to civilian appointees for decision.

On Defining the Purposes of the Effort

15. Optimum results can only be obtained from staff actions when the action officer clearly understands what

he is trying to accomplish. A problem can be clearly defined and yet the solution can serve different purposes. While there may only be one solution there are numerous ways in which the subject can be developed, emphasized and presented, depending on what use is to be made of the solution. There is a tendency in our present planning to fail to recognize this.

16. For example, if the purpose of a study is to make a contribution of airpower expertise to some other activity, such as implement a particular foreign policy, there is little purpose in a detailed analysis of the validity of the foreign policy itself. On the other hand, if the same study is made for the purpose of determining whether the Air Force should participate or not in implementing a foreign policy action, analysis of the policy itself may be as important as examination of the possible detailed nature of Air Force participation.

17. Of course, another important consideration in defining the purpose of a study, or action, is the necessity to maximize economy of staff effort. Occasionally, actions are directed without a clear or useful purpose in mind. When this occurs, it is not unusual to reconsider the need for the study after a great amount of staff effort has been expended.

18. While it is not always possible to ascertain the ultimate purpose of a particular study, better analyses will be produced if a concerted effort is made to tell the action officer specifically what use is to be made of the end product of his work.

On the Adequacy of Direction

19. In principle, the higher the status of an individual within an organization, the broader and more general is his knowledge, experience, and outlook.

20. The product of an organization normally represents a synthesis of the knowledge and experience of the various staff levels through which a given subject is processed. This synthesis can take place in three general forms:

a. Higher echelons can inject their views into a product which has been assigned to a lower echelon for action without prior guidance, and after a great effort has been expended, or

THIS PAGE IS DECLASSIFIED IAW EO 13526

b. Higher echelons can provide their broader knowledge to the lower echelons, along with the initial assignment of a task, and then review the final product for sufficiency, or

c. Lower echelons can initiate ideas, actions, and concepts for review and possible approval by the higher echelons.

21. The first approach is undoubtedly the easiest from the busy bureaucrat's point of view and, unfortunately, perhaps the most prevalent. It is also the least effective and most wasteful of time on the long run. Analyses of successful organizations suggest the second and third approaches are the most effective for the following reasons:

a. Better End Product. Given the supervisor's views, the action officers know generally what is wanted and start out "in the right ball park." Their effort involves researching and developing details, supporting evidence, examples, etc; placing the material in proper format; and, where appropriate, uncovering fallacies in the guidance received and suggesting changes. At the minimum the supervisor gets his views documented in a final form. Normally, he will have his initial desires reinforced, further developed, amplified or, on occasion, challenged.

b. Morale of the Staff. Given the supervisor's views on projects before they start takes much of the uncertainty out of the subordinate's efforts. Additionally, it quickly imparts much of the supervisor's broad knowledge to the action officers with the feed-back effect of reducing the guidance they need and increasing the "team" impact of the effort. An environment is created in which projects and concepts are initiated by the staff, oftentimes with very beneficial results. The action officer no longer feels he is struggling "in the dark." He is not trying to outguess the supervisor to produce "acceptable" solutions. Additionally, under this system, the lower echelon action officer doesn't feel that his intermediate supervisors are "passing the buck" to them for work the senior echelons don't accept.

c. Economy of Effort. Work without guidance may be received three ways at every successive level through which it is processed: (1) Rejected and "tried again," (2) Re-done at the next level, or (3) Adjusted and moved on. The first two result in wasted effort and

poor morale when they occur. Work done in furtherance of full guidance will almost always be acceptable enough to move on with minor adjustments. This is clearly the desired procedure.

22. Our planning procedures today, particularly on JCS actions and staff studies, seem oriented too much towards letting the working level struggle with the problems without guidance, offsetting "gross" errors by insisting on a "Gallup Poll" type of coordination at relatively low staff levels, and modifying the action officer's efforts by redirection or the injection without challenge of personal views by way too many intermediate chiefs often without identifying these from the original"expert's" findings thereby, at times, leaving the action officer apparently at fault for a product changed without his agreement or knowledge.

23. Perhaps the greatest waste of effort, however, is the failure to exploit topical expertise on recurrent problems or on major subjects. More of an effort could be made to have one officer carry a problem or subject through to conclusion. In processing a single AFOS paper we have often experienced 3 changes in action officers. In formulating 4 replies to Congressional bills which deal with defense reorganization, my office has worked with 3 different action officers. Each time a new action officer appeared we had to take time to bring him up-to-date on the entire background of the subject.

On Researching the Subject Matter

24. The staff should be encouraged to research problems presented to them as thoroughly as possible, in the time allowed, before developing their solutions. The administration and filing system must be organized to support this.

25. All too frequently we find examples of an action officer struggling to develop a paper without ever checking to see if the sucject had not already been thoroughly developed in an earlier staff study. Of course, this problem is accentuated by the apparent unpredictable assignment of specific tasks to various branches and divisions.

26. Obviously, the ideal situation is for the action office to have at hand every previous study made on the subject on which he is working. Using these, as a point of departure, he merely adjusts them in light of

the new circumstances. Instead of using the products of past staff efforts we often tend to rely for accuracy on the current and ad hoc opinions of our contemporaries.

27. There are innumerable examples of decisions being made on the basis of staff studies developed from scratch in a few days when the same subject had been thoroughly researched over a period of many months in one of the War Colleges, or in the staff.

28. The present system seems to place a higher premium on "quantity" of output, and on the speed at which it is produced than on quality. Action officers are evidently under the impression that the premium is for lots of words produced in a short period of time than for a very short and sound solution developed from a longer period of analysis. This attitude should be changed.

On Exploiting the Product

29. It seems important to the overall Air Force effort that we get maximum mileage out of the unusual latent ability of the people in the staff. This can only be done if we are so organized as to fully exploit the output of the staff.

30. Generally speaking, staff efforts are now used only for the primary purpose for which they were developed. Once they have served this purpose no attempt is made to analyze the work for possible use in secondary purposes and to process it and exploit if accordingly.

31. When a great deal of effort has gone into developing a position on a given subject it would seem that the results of this effort should be recorded in a form and by a procedure which would preclude going over the same ground when the problem again arises. This was the rationale for placing the AFOS series on an annual review basis in lieu of the FSPO system of annually providing a paper. The product of major staff efforts should also be distributed to all Air Force agencies who might usefully exploit the findings.

32. Since timing is an important factor in the value of studies and recommendations there is some merit to reviewing from time to time past recommendations, which were not implemented when developed, but which might well be usefully "fired up again" and processed for implementation as a result of some change in circumstances.

THIS PAGE IS DECLASSIFIED IAW EO 13526

33. There is some evidence to suggest that certain Air Staff agencies could produce useful outputs for a long period of time by the process of "mining" their own files of past actions without ever adding anything new but only up-dating and re-processing.

SUMMARY

34. All of the above principles obviously are being followed in varying degrees at present. However, there is much room for improvement. I am convinced that if these principles were reiterated, and if the supervisors from branch chiefs up made a conscientious effort to apply these principles to our collective planning efforts, the results would be tremendous.

35. Certain organizational changes also appear appropriate. Some that should be considered include:

a. A research staff in the Plans filing organization to provide action officers quickly with all past studies relating to their problems. Records Library does very well on this now, but their services are not used fully to uncover work done in Plans, and we are not organized to get outside references such as National War College papers, etc.

b. A specific office, or individual, responsible for secondary exploitation of Air Staff efforts. This could be an additional function of AFXAC. Major studies or papers would be reviewed for possible secondary use such as inputs to SAFOI, Legislative Liaison activities, War College efforts, Speech Writers, etc.

c. Implementation of the decision influencing proposals made by AFXDC to the command echelon some months past.

d. Separation of the responsibility for processing current actions (JCS) and for the research and development of the Air Force position on major issues. See the AFXPD-LR study on "The Development and Dissemination of Plans, Concepts and Policies" dated 23 Ocrober 1959 for possible organizational solutions.

(25) Some Thoughts on Disarmament

COPY

Mr. Charles A. Coolidge
Coolidge Committee
700 Jackson Place N.W.
Washington, D. C.

Dear Mr. Coolidge

There has been much public concern over the inability of the Western Powers and the USSR to arrive at a disarmament agreement. This is, of course, understandable. It seems self-evident, however, that the maintenance by all major powers of a high level of military preparedness is as much a symptom as a cause of political tension. I feel that past failures should not give rise to discouragement or pessimism. For the first time in more than a decade there appears to be some justification for cautious optimism regarding the possibility of disarmament.

The problem of disarmament is essentially political in the broad sense of that term. There are, of course, very strong economic and moral elements involved. It seems to me that a viable disarmament proposal must also be based on a greater measure of military analysis than has been offered in the past. I therefore have asked my planning staff to re-examine the disarmament problem in order that the Air Force may contribute, if called upon, to the solution of this vital issue.

Since it is within neither our province nor our competence to analyze the many non-military factors relevant to disarmament, our planners are not attempting to evolve a detailed, comprehensive proposal for limitation or control of armaments. The attached paper is merely an outline of some thoughts on disarmament which may be of interest to your Committee. This approach appears to have merit and to avoid several pitfalls of previous proposals. It is believed to be acceptable as a basis for negotiations with the USSR. I will be pleased to make members of my staff available for discussion of these ideas if you wish.

Sincerely,

(Signed by
General White)

SOME THOUGHTS ON DISARMAMENT

General

1. The greatest immediate threat to the U.S. or our allies is general war. Limited war constitutes a serious menace both by virtue of its potential as an eroding force and of the ever-present possibility of expansion into general war.

2. In recent years, the trend of disarmament proposals has been oriented primarily toward reduction of the threat of general war through control of the production, storage and employment of fissionable materials and by measures to reduce or eliminate the possibility of surprise attack. Reduction of non-nuclear armaments has received secondary attention. In September 1959 the USSR offered a proposal for total disarmament. It is not yet possible to make an accurate analysis of its true significance.

3. So long as a high level of political tension exists, it seems unlikely that abolition of armaments can take place. Nevertheless, political and economic pressures may engender a genuine desire on the part of the major powers to progress toward achievable ends rather than merely to seek propaganda advantages.

4. Disarmament negotiations must be conditioned by a thorough and objective appraisal of military factors. It is imperative that agreements for control or limitation of armaments do not compromise the relative power politics of the United States or its major allies vis-a-vis the Communist Bloc. We must seek to assure the continued existence of these capabilities until such time as absolute political safeguards against Communist threats to the survival of the Western nations may be constructed.

5. The Communist objective of world domination will remain unaltered whether the Communist nations support disarmament or not. Acceptance by the Communist Bloc of a significant reduction in armaments or significant control measures would indicate only that they have shifted the focus of aggression to other areas and other means.

6. It must be assumed, until proved otherwise, that the USSR will observe a disarmament agreement, with or without controls, only so long as the agreement appears to be to her self-interest.

THIS PAGE IS DECLASSIFIED IAW EO 13526

COPY

Criteria for Viable Disarmament Agreements

7.. A workable proposal for control or limitation of armaments must serve, or appear to serve, the self-interests of the major powers. From the point of view of the U.S., disarmament must:

a. Not offer the Communist Bloc an overall military advantage.

b. Provide for controls capable of implementation from political and technological standpoints.

c. Avoid creating a feeling of false security.

d. Avoid disarmament by formula based on either population or existing force levels.

e. Provide for an evolutionary reduction of armaments to a level of military force adequate to preserve the internal security of all signatories but inadequate to support aggression.

f. Offer a reasonable degree of security from direct attack upon the U.S., its allies and neutrals during the disarmament process.

g. Maintain a U.S. and allied capability for rapid rearmament in the event of serious violations by the USSR or Communist China.

8. From the Soviet point of view, a disarmament agreement should:

a. Appear to offer a long-term relative overall advantage over the Western Powers.

b. Reduce the existing strain on the Soviet economy.

c. Establish minimum and carefully controlled access to the USSR by foreign agents.

d. Include point f. and g. above as they pertain to the USSR.

COPY

Tentative Conclusions

9. The following tentative conclusions and suggestions pertinent to a workable approach to disarmament are offered for consideration.

a. Complete and rapid disarmament appears to be neither attainable nor desirable so long as the Communists adhere to their goal of world domination.

b. The rising cost of military preparedness is becoming burdensome to all nations which maintain significantly large military establishments.

c. There continues to be a lack of mutual trust between the Western nations and the Communist Bloc. In the absence of good faith, fruitful negotiations for removal of the threat of general war cannot be conducted. Both the USSR and the U.S. consider their strategic offensive forces in the dual capacity of deterrent and war winning forces; hence neither can afford to surrender relative advantage to the other by accepting reductions or control of these forces without positive assurance of reciprocity.

d. Further, nuclear disarmament as a first step toward more comprehensive programs would deprive the Western powers of quality weapons which are an effective counter-balance to the Communist Bloc superiority in manpower, and would leave the Western powers in an extremely disadvantageous position.

e. It is believed, however, that both sides, for political and economic reasons, do desire a reduction of armaments to be achieved in such a manner that neither surrenders relative advantage to the other. If the economic factor has indeed become dominant as a motive for disarmament, negotiations may be usefully directed toward a reduction in the forces and weapons associated with wars of attrition, limited wars and, generally speaking, in those areas where quantity of forces and weapons dominate rather than quality.

f. This approach to disarmament has the following advantages:

(1) Reductions could be agreed upon in weapon systems and areas where neither side would gain a decisive advantage by evasion or subversion.

THIS PAGE IS DECLASSIFIED IAW EO 13526

COPY

(2) Reductions could be agreed upon in weapon systems which depend for their effectiveness on quantity or numerical mass. In these areas, total and thorough inspection is not necessary, but only inspection adequate to insure that the greater portion of the mass concerned is in fact immobilized.

(3) Inspection could take place after the fact, and only in locations designated by the interested parties in which the weapons would be stored or destroyed.

(4) Demonstrated good faith in the disestablishment of secondary systems would produce sizeable economic savings initially, and might lead to disarmament in the more important general war systems at a later date.

(5) Elimination or drastic reduction of the potential for waging lesser wars would relieve international tensions to a significant degree by reducing the probability of using military force as an instrument of national policy, and thus removing a potential cause of general war. This reduction of tension would improve the chances of obtaining an acceptable agreement for general disarmament.

10. It could be argued that to approach disarmament from the limited war point of view, and from that of first eliminating the quantitative, obsolescent weapon systems tends to return us to a strategy of massive retaliation. This is not the case, however, for massive retaliation envisioned the use of the general war force in retaliation for lesser acts of war. Disarmament at the lower end of the spectrum would seek to reduce both sides' capability for lesser conventional wars and thus remove or reduce the rationale associated with massive retaliation.

11. Any disarmament proposal for the period 1960-1970 must take into account the military structure and potential of Communist China. So long as the CHICOMs do not possess nuclear weapons and advanced delivery systems, it is unlikely that they would consider a proposal for a drastic reduction in conventional arms. Their refusal to do so might be exploited to create friction between Communist China and the USSR. In any event, it is believed that our continued possession of nuclear weapons and advanced delivery systems would constrain the CHICOMs from using conventional forces as effectively as our current nuclear and limited conventional capability.

TECHNOLOGY'S IMPACT ON SECURITY

6-4139-26

THIS PAGE IS DECLASSIFIED IAW EO 13526

Staff Paper
AFXPD-LR
16 March 1961

Brief on

TECHNOLOGY'S IMPACT ON SECURITY

GENERAL DISCUSSION

1. Two new phenomena have tended to disassociate the public's image of security - the job of keeping America secure - from the Defense Department. These developments have crept up on us all but unnoticed. They fog the vision, outmode classical ways to deal with security problems, and confound our efforts to develop a viable national military strategy. For that matter, they even make it difficult to develop a national strategy, for military strategy today assumes a bigger-than-ever importance in overall national strategy.

2. The first of these phenomena is that traditional military forces cannot be used in fourth dimensional warfare - a rifle or a submarine or an airplane is ineffective against an idea or the gift of a dam or the impression of technological prowess created by a success in space. Our sense of security is threatened by these new ways to wage war and, of course, the Defense Department contributes relatively little in this area.

3. The second phenomenon is a psychological condition in which many question whether "security" will in fact be provided

6-4189-27

THIS PAGE IS DECLASSIFIED IAW EO 13526

[illegible] the armed forces [illegible] are called on to perform. Historically, the armed forces provide [illegible] by protecting [illegible] lives and homes from enemy forces. If the man on the street thinks that this type of protection will henceforth involve the destruction of the persons being protected as well as the aggressor, then to him the cure has become as painful as the disease. To a person thus persuaded, military action, no matter how successful, no longer [illegible] the security traditionally sought from military forces. It matters little that this image of modern war may not be valid. That it exists at all - and none will question that it exists - serves to [illegible] security from defense in the public mind.

[illegible] The first [illegible] must be coped with [illegible] and will not be discussed here. The second, however, is the burden of this paper.

[illegible] TO MANEUVER

The Greek [illegible] wrote, "The art of war is, in the [illegible] resort, the art of keeping one's freedom of action." [illegible] thought has stood up through the ages and is pertinent [illegible]. For the users of military power in the United States - the State Department and the Executive - have said that our strategy is bad, that it gives them too little room to maneuver. [illegible] say that our military force is not useful to them because [illegible] affords them little or no flexibility.

THIS PAGE IS DECLASSIFIED IAW EO 13526

6. A number of factors contribute to the maneuver room statesmen say they need. First of all, they want to be able to control the force. Today's nuclear posture makes this difficult. For if the enemy has the capability to use atomic weapons, then we are constrained to equip our forces to defend in kind, even though we instruct our commanders not to use these weapons. Thus modern forces do not give the statesman controllability, for he cannot be certain that a limited action will remain "limited" to conventional munitions. The battlefield commander cannot be counted on to avoid using atomics if survival of his force depends on using them, or if atomics are being used against him.

7. Time for decision is a second factor. ICBMs give 15 minutes. Warning time is a related factor and the same disadvantage applies. Thus, modern missile forces do not give him the characteristics he feels he needs.

EVOLUTION OF DOMINANT WAR SYSTEMS

8. Strangely, the emergence of each new dominant war system in this century has tended to exaggerate the danger attached to war and thus to complicate the statesman's job. Instead of making his work easier, giving him the variety of options he desires, these new weapons have [illegible] his maneuver room until today he complains that he has none at all.

THIS PAGE IS DECLASSIFIED IAW EO 13526

9. Sea power, of course, was an ideal tool for the diplomat. War and the threat of war were far removed from his own shores in those halcyon days of the grand strategy. There was much time for decision. And within these comfortable arrangements the diplomat could and did maneuver to his heart's content.

10. But each succeeding war system, built with an expanding technology, cut into the statesman's art. Large land war systems, for example, resulted in wide damage, huge losses, and could not always be controlled, sometimes expanding beyond the statesman's original intent. More recently, the development of the atomic bomb coincident with the jet bomber removed land and sea barriers, provided unfettered access to the enemy's forces, reduced time for decision, and increased the scope of destruction. Finally, today, the ICBM has for all practical purposes reduced maneuver space to zero. In a word, then, security has declined as technology has advanced or improved.

THE STATESMAN'S APPROACH

11. Faced with this kind of dilemma, the statesman has sought to increase his maneuver room by other means. This search has taken two main directions. One is the disarmament road. Advocates argue that if we can disarm, then of course there would be an immediate boom in security. But faced with an enemy who refuses to grant inspection privileges and who employs disarmament talks as a Cold War device, it quickly

THIS PAGE IS DECLASSIFIED IAW EO 13526

becomes obvious that disarmament's contribution to security is totally illusory and would, rather than improve our security, expose us to instant and complete danger from a notorious cheater. This is understood today by most persons. Nonetheless, there remain a large number who would disarm, unilaterally if necessary.

12. Another direction taken by persons seeking a way out of the maneuver room dilemma is to go back to building forces for fighting conventional limited wars: wars perhaps the size of Korea, or perhaps even wars with the Soviet Union itself. This, proponents say, would give us new flexibilities, new maneuver room. This idea tends to appeal when looked at superficially. However, it overlooks the following important factors:

a. That the direct threat to the United States is from Soviet strategic forces - rockets and aircraft and submarines. We must always be ready to handle this problem, fund for lesser jobs with remaining monies. Advocates of large conventional limited war forces, however, contend that these should be built at the expense of strategic forces if need be. The problem is largely economic, however, for as the support for one goes up, the support for the other goes down.

b. That trying to deter war with strategic forces that have less than an ability to win a war - i.e., minimum, finite, or stable deterrence - is a travesty. If deterrence fails, we lose the resulting war.

THIS PAGE IS DECLASSIFIED IAW EO 13526

c. That readying for large-scale, classical wars of attrition (against an enemy whose overwhelming manpower advantage is well understood) tells the enemy that we have now concluded that total war is too horrible to contemplate and invites him to lesser military adventures to test our willingness to respond. Worse, the mere fact that we plan for this old kind of war doesn't force him to do the same. He may just watch while we fritter away our manpower, money and materials.

d. That the effect on allies and alliances can be dramatic. It tells our allies that the United States' strategic deterrent is no longer valid, will not be used in their defense. It serves notice on our allies that we intend to fight World War III on their soil (where else would be plan to employ these forces?). Paul Henri-Spaak sounded a caution on this point several years ago.

e. That technology cannot stand still, that what might appear today to be a stalemate in technology can disappear like a soap bubble in tomorrow's technological breakthrough.

f. That nuclear weapons are today's "conventional" weapons, that their use is inevitable in all but border actions, incursions, incidents. Having deployed for atomic defense, the classical "mass" of warfare must be the atomic weapon.

g. That – and most importantly – we already have a sizeable limited war capability, one that has seldom if ever

0769

THIS PAGE IS DECLASSIFIED IAW EO 13526

been called upon to perform in any limited action. What more could we have done in Laos with five extra divisions? How better could we have responded to the Congo crisis with two extra carriers? Could we have handled the Cuban situation better with another four squadrons of tactical fighters? This rationale suggests that the solution to the "limited war" problem requires advancement in the political field as well as (or instead of) in the purely military field. For the military today has the capability to react swiftly to the statesman's call for limited action, to deploy swiftly - in hours - to the scene of an aggression, to establish the fact that there is an aggression, to defeat the aggression, or - failing - quickly to define for the political leaders the level of decision that is needed. That it has not been called upon does not necessarily demonstrate its inadequacy.

13. This kind of argumentation suggests that there is another, better, route to more maneuver room, one that doesn't [illegible] from fright, one that is rational and logical.

SOLVING THE DILEMMA

14. The technology of destruction never remains static. For every new weapon there is a counter-weapon. Each dominant weapon system has yielded to another in an ever-faster succession of events that has shrunk time. This very fact suggests that whereas disarmament or a relat[illegible] to peace might indeed reduce [illegible]

THIS PAGE IS DECLASSIFIED IAW EO 13526

today's ICBM-induced balance of terror, a clear-headed and courageous solution would be to move rapidly through this period by expediting the development of new weapons and strategic concepts that eliminate the spasm, hair-trigger, non-selective characteristics of the missile. Such a weapon offers the prospect of providing security and even of being used in the achievement of national objectives. Space systems and space technology open this kind of possibility.

15. We can begin to work our way out of the delicate balance of missile terror when satellites and spacecraft take over as the dominant war system. Rather than being an irresponsible and dangerous extension of a meaningless arms race, space offers a return to security and a sensible end to the threat of atomic annihilation. For any weapon or control device that uses space must, by definition, be physically divorced from the property and lives of the persons whose security it is designed to provide. Additionally, space offers vast distances, tremendous speeds, and almost unlimited time aloft - characteristics a military planner dreams of, characteristics which can be forged into decisive war weapons literally capable of disarming an enemy.

16. Since no war can logically take place unless the opposing sides come to grips with each other's principal weapons, attrition in space will have to be a prelude to conquest on earth. The word attrition itself carries with it the

THIS PAGE IS DECLASSIFIED IAW EO 13526

clear implication of long-duration conflict. Thus conflict in space will give warning time, time to prepare defenses, time to alert the people for survival, or alternatively to discuss cessation of hostilities before they can spread to the lesser-included phase of destruction on earth. This is the kind of maneuver room the statesman needs.

17. It is clear, then, that there are two courses of action open both to the USSR and the Free World. We can seek security by the international route of mutual trust in disarmament devices. Or we can seek security by the natural and evolutionary route of exploiting technological opportunities to develop space systems whose characteristics solve the statesman's maneuver room dilemma and the [illegible] presented to the people by having their security threatened as much by defense measures as by the enemy offense.

18. No rational person will argue that disarmament is not the more attractive path to peace. But the same rational person will probably concede that arms control has as much chance of success as would an effort to take smoke and drink from the human race.

19. Military space capabilities will come of their own momentum. What we should do, however, is to expedite the process by recognizing the advantages to be gained by substituting space systems for ICBMs as the ace of trumps in the

military game. Either way, we can be reasonably sure of one thing - the Soviets have recognized this truth and they are thrusting at full throttle for a decisive capability in space. If they are successful, they can deny space to the West. The strategic consequences of such a victory challenge the imagination.

Brief on

TECHNOLOGY'S IMPACT ON SECURITY

GENERAL DISCUSSION

1. Two new phenomena have tended to disassociate the public's image of security - the job of keeping America secure - from the Defense Department. These developments have crept up on us all but unnoticed. They fog the vision, outmode classical ways to deal with security problems, and confound our efforts to develop a viable national military strategy. For that matter, they even make it difficult to develop a national strategy, for military strategy today assumes a bigger-than-ever importance in overall national strategy.

2. The first of these phenomena is that traditional military forces cannot be used in fourth dimensional warfare - a rifle or a submarine or an airplane is ineffective against an idea or the gift of a dam or the impression of technological prowess created by a success in space. Our sense of security is threatened by these new ways to wage war and, of course, the Defense Department contributes relatively little in this area.

3. The second phenomenon is a psychological condition in which many question whether "security" will in fact be provided

THIS PAGE IS DECLASSIFIED IAW EO 13526

by the armed forces if they are called on to perform. Historically, the armed forces provide security by protecting citizens' lives and homes from enemy forces. If the man on the street thinks that this type of protection will henceforth involve the destruction of the persons being protected as well as the aggressor, then to him the cure has become as painful as the disease. To a person thus persuaded, military action no matter how successful, no longer promises the security traditionally sought from military forces. It matters little that this image of modern war may not be valid. That it exists at all - and none will question that it exists - serves to disassociate security from Defense in the public mind.

4. The first phenomenon must be coped with extra-militarily and will not be discussed here. The second, however, is the burden of this paper.

ROOM TO MANEUVER

5. The Greek Xenephon wrote "The art of war is, in the last resort, the art of keeping one's freedom of action." This thought has stood up through the ages and is pertinent here. For the users of military power in the United States - the State Department and the Executive - have said that our strategy is bad, that it gives them too little room to maneuver. They say that our military force is not useful to them because it offers them little or no flexibility.

THIS PAGE IS DECLASSIFIED IAW EO 13526

6. A number of factors contribute to the maneuver room statesmen say they need. First of all, they want to be able to control the force. Today's nuclear posture makes this difficult. For if the enemy has the capability to use atomic weapons, then we are constrained to equip our forces to defend in kind, even though we instruct our commanders not to use these weapons. Thus modern forces do not give the statesman controllability, for he cannot be certain that a limited action will remain "limited" to conventional munitions. The battlefield commander cannot be counted on to avoid using atomics if survival of his force depends on using them, or if atomics are being used against him.

7. Time for decision is a second factor. ICBMs give 15 minutes. Warning time is a related factor and the same disadvantage applies. Thus, modern missile forces do not give him the characteristics he feels he needs.

EVOLUTION OF DOMINANT WAR SYSTEMS

8. Strangely, the emergence of each new dominant war system in this century has tended to exaggerate the danger attached to war and thus to complicate the statesman's job. Instead of making his work easier, giving him the variety of options he desires, these new weapons have closed in steadily on his maneuver room until today he complains that he has none at all.

THIS PAGE IS DECLASSIFIED IAW EO 13526

9. Sea power, of course, was an ideal tool for the diplomat. War and the threat of war were far removed from his own shores in those halcyon days of the grand strategy. There was much time for decision. And within these comfortable arrangements the diplomat could and did maneuver to his heart's content.

10. But each succeeding war system, built with an expanding technology, cut into the statesman's art. Large land war systems, for example, resulted in wide damage, huge losses, and could not always be controlled, sometimes expanding beyond the statesman's original intent. More recently, the development of the atomic bomb coincident with the jet bomber removed land and sea barriers, provided unfettered access to the enemy's forces, reduced time for decision, and increased the scope of destruction. Finally, today, the ICBM has for all practical purposes reduced maneuver space to zero. In a word, then, security has declined as technology has advanced or improved.

THE STATESMAN'S APPROACH

11. Faced with this kind of dilemma, the statesman has sought to increase his maneuver room by other means. This search has taken two main directions. One is the disarmament road. Advocates argue that if we can disarm, then of course there would be an immediate boom in security. But faced with an enemy who refuses to grant inspection privileges and who employs disarmament talks as a Cold War device, it quickly

THIS PAGE IS DECLASSIFIED IAW EO 13526

becomes obvious that disarmament's contribution to security is totally illusory and would, rather than improve our security, expose us to instant and complete danger from a notorious cheater. This is understood today by most persons. Nonetheless, there remain a large number who would disarm, unilaterally if necessary.

12. Another direction taken by persons seeking a way out of the maneuver room dilemma is to go back to building forces for fighting conventional limited wars: wars perhaps the size of Korea, or perhaps even wars with the Soviet Union itself. This, proponents say, would give us new flexibilities, new maneuver room. This idea tends to appeal when looked at superficially. However, it overlooks the following important factors:

a. That the direct threat to the United States is from Soviet strategic forces - rockets and aircraft and submarines. We must always be ready to handle this problem, fund for lesser jobs with remaining monies. Advocates of large conventional limited war forces, however, contend that these should be built at the expense of strategic forces if need be. The problem is largely economic, however, for as the support for one goes up, the support for the other goes down.

b. That trying to deter war with strategic forces that have less than an ability to win a war - i.e., minimum, finite, or stable deterrence - is a travesty. If deterrence fails, we lose the resulting war.

THIS PAGE IS DECLASSIFIED IAW EO 13526

c. That readying for large-scale, classical wars of attrition (against an enemy whose overwhelming manpower advantage is well understood) tells the enemy that we have now concluded that total war is too horrible to contemplate and invites him to lesser military adventures to test our willingness to respond. Worse, the mere fact that we arm for this old kind of war doesn't force him to do the same. He may just watch while we fritter away our manpower, money and materials.

d. That the effect on allies and alliances can be dramatic. It tells our allies that the United States' strategic deterrent is no longer valid, will not be used in their defense. It serves notice on our allies that we intend to fight World War III on their soil (where else would we plan to employ these forces?). Paul Henri-Spaak sounded a caution on this point several years ago.

e. That technology cannot stand still, that what might appear today to be a stalemate in technology can disappear like a soap bubble in tomorrow's technological breakthrough.

f. That nuclear weapons are today's "conventional" weapons, that their use is inevitable in all but border actions, incursions, incidents. Having deployed for atomic defense, the classical "mass" of warfare must be the atomic weapon.

g. That — and most importantly — we already have a sizeable limited war capability, one that has seldom if ever

been called upon to perform in any limited action. What more could we have done in Laos with five extra divisions? How better could we have responded to the Congo crisis with two extra carriers? Could we have handled the Cuban situation better with another four squadrons of tactical fighters? This rationale suggests that the solution to the "limited war" problem requires advancement in the political field as well as (or instead of) in the purely military field. For the military today has the capability to react swiftly to the statesman's call for limited action, to deploy swiftly - in hours - to the scene of an aggression, to establish the fact that there is an aggression, to defeat the aggression, or - failing - quickly to define for the political leaders the level of decision that is needed. That it has not been called upon does not necessarily demonstrate its inadequacy.

13. This kind of argumentation suggests that there is another, better, route to more maneuver room, one that doesn't lead from fright, one that is rational and logical.

SOLVING THE DILEMMA

14. The technology of destruction never remains static. For every new weapon there is a counter-weapon. Each dominant weapon system has yielded to another in an ever-faster succession of events that has shrunk time. This very fact suggests that whereas disarmament or a return to peace might indeed reduce

THIS PAGE IS DECLASSIFIED IAW EO 13526

today's ICBM-induced balance of terror, a clear-headed and courageous solution would be to move rapidly through this period by expediting the development of new weapons and strategic concepts that eliminate the spasm, hair-trigger, non-selective characteristics of the missile. Such a weapon offers the prospect of providing security and even of being used in the achievement of national objectives. Space systems and space technology open that kind of possibility.

15. We can begin to work our way out of the delicate balance of missile terror when satellites and spacecraft take over as the dominant war system. Rather than being an irresponsible and dangerous extension of a meaningless arms race, space offers a return to security and a sensible end to the threat of atomic annihilation. For any weapon or control device that uses space must, by definition, be physically divorced from the property and lives of the persons whose security it is designed to provide. Additionally, space offers vast distances, tremendous speeds, and almost unlimited time aloft - characteristics a military planner dreams of, characteristics which can be forged into decisive war weapons literally capable of disarming an enemy.

16. Since no war can logically take place unless the opposing sides come to grips with each other's principal weapons, attrition in space will have to be a prelude to conquest on earth. The word attrition itself carries with it the

THIS PAGE IS DECLASSIFIED IAW EO 13526

clear implication of long-duration conflict. Thus conflict in space will give warning time, time to prepare defenses, time to alert the people for survival, or alternatively to discuss cessation of hostilities before they can spread to the lesser-included phase of destruction on earth. This is the kind of maneuver room the statesman needs.

17. It is clear, then, that there are two courses of action open both to the USSR and the Free World. We can seek security by the international route of mutual trust in disarmament devices. Or we can seek security by the natural and evolutionary route of exploiting technological opportunities to develop space systems whose characteristics solve the statesman's maneuver room dilemma and the dilemma presented to the people by having their security threatened as much by defense measures as by the enemy offense.

18. No rational person will argue that disarmament is not the more attractive path to peace. But the same rational person will probably concede that arms control has as much chance of success as would an effort to take smoke and drink from the human race.

19. Military space capabilities will come of their own momentum. What we should do, however, is to expedite the process by recognizing the advantages to be gained by substituting space systems for ICBMs as the ace of trumps in the

SPEECH TO THE AMERICAN LEGION SECURITY COMMITTEE

ON

THE FUTURE AIR FORCE

THE AIR FORCE 1960-1970

The Evolution of U.S. Tactical Air, 1960-1970

1. Throughout the 1960-1970 period we see a need for U.S. overseas and U.S. based tactical air forces. In the middle part of the time period and thereafter, it should be, however, militarily practicable to substitute mobility and rotation of U.S. based units for permanent oversea's stationing. If this seems desirable.

2. Ultimately, the number of units permanently deployed in foreign countries could be reduced to the minimum consistent with political and military objectives. Determination of the appropriate minimum, from both the political and military standpoint, will be influenced by the degree to which it has been possible to develop an effective all-weather nuclear capability in allied and indigenous tactical air forces. The objective, as we see it, should be to have our allies, however, progressively assume a greater responsibility for the provision of tactical type air forces.

3. Manned aircraft systems will have less probability of survival as the enemy continues to modernize with short and medium range ballistic missiles.

4. On the other hand, tactical missiles can have a relatively high survival potential and can produce the necessary military effect on preplanned target systems.

5. A combination of mobile and hardened tactical ballistic missiles should be the optimum weapon system for U.S. and allied overseas tactical air forces as early as possible.

6. Missiles organic to Army forces would supplement and complement the tactical air missiles by covering the shorter ranges of the spectrum.

7. Concurrently with the modernization of U.S. tactical Air Force units overseas with tactical ballistic missiles, we would see a build-up of our allies with the same type of weapon system. As allied air forces become equipped with these missiles, they should assume increasing responsibility for primary D-Day targets. Eventually, most of the initial general war operations in the defense of overseas areas would, we hope, be assumed by allied forces.

8. When economic and political conditions and the new concepts essential to adjusting to technology result in a reduction of manned units we will have to rely increasingly on allied air forces, and U.S. based mobile forces for response to limited war situations.

9. We consider that manned aircraft systems are more suitable than missiles for use in limited war because of flexibility, varying conditions for employment, and selectivity

THIS PAGE IS DECLASSIFIED IAW EO 13526

of weapons. Those tactical air forces of the U.S. that will be optimized for the limited war mission we believe must be primarily equipped with manned systems.

10. It is militarily and economically impractical to base U.S. forces in all areas of the world where a limited war may occur. Appropriately constituted tactical forces must be based in the U.S., prepared to move rapidly to any threatened area. During the time period, any requirement for tactical air forces in forward areas to insure speed of reaction in meeting limited aggression can be met by rotational forces to the maximum practical extent.

11. Our view, however, is that we should depend wherever possible upon local and allied air forces to provide the initial response to limited aggressions.

12. The Air Force concept for dealing with limited war situations is to have first, an indigenous response in the local defense, second, a U.N. response, third, an allied regional response, and only where these are inadequate should a unilateral U.S. response be undertaken.

13. We think that tactical air forces committed to support allied defenses against local aggression should be able insofar as practical to deliver either conventional or atomic weapons, depending on the circumstances. In any event, the employment of weapons should be appropriate to defeating the aggression

THIS PAGE IS DECLASSIFIED IAW EO 13526

quickly and decisively, without expanding the conflict, or without surrendering excessive free world territory before responding with our atomic weapons. Thus being forces to use these against an aggressor when in our territory rather than when he is in or near his own territory.

The Evolution of U.S. Aerospace Defense 1960-1970

1. A war fighting strategy demands that the enemy aerospace forces be destroyed on the ground or in aerospace as far from the United States as possible.

2. The widespread military effects that can be achieved by enemy forces attacking the United States in 1960-1970 time period demand an optimum combination of offensive and defensive means to reduce to the absolute minimum the forces able to deliver weapons on the U.S.

3. Our air defense forces must therefore be progressively improved, not only for continued defense against the manned bomber threat, but also for an effective defense against ballistic missiles while striving to attain a space counter-weapon capability.

4. We expect Soviet bombers to improve in speed, altitude, and in their electronic countermeasure and air-to-surface missiles capabilities. As Soviet ICBMs become available in sufficient numbers for an initial assault, bombers are expected to decrease in numbers, but will remain a threat throughout the period as a follow-on force.

THIS PAGE IS DECLASSIFIED IAW EO 13526

5. The element of the aerospace defense system most needed to counter the Soviet bomber, with airborne missiles, is a fast interceptor with improved combat radius to provide for defense at increased range, hence manned air defense systems will be required for the foreseeable future in our view.

6. The active aerospace defense of each region must be done by an effective regional defense system. These must be as mutually supporting as their technical characteristics permit. The first steps which have been taken toward a capability for warning if attack by ballistic missiles (BMEWS) should be expanded by the addition of satellites and other new sensors into systems which give warning and tracking of ballistic missiles, satellites, and maneuvering space vehicles.

7. We must attain an early aerospace operational capability to track missiles and satellites, since warning and tracking are basic elements of an active aerospace defense system.

8. Ballistic missiles in the hands of the USSR have weakened our military position, since US fighting forces and the nation itself are now increasingly subject to possible destruction by missile attack against which no adequate defense currently exists.

9. With the United States and the USSR both building large missile forces, the one which first has an effective defense against these weapons will achieve a significant military

advantage. The capability to destroy enemy launched ICBMs as far from the United States as possible becomes, therefore, an aerospace defense requirement of utmost urgency.

10. We consider that research must be accelerated now in order to expedite a decision on the means of attaining the most effective capability for a space based missile defense.

11. Since satellites could be used by the USSR for reconnaissance and other military purposes in the next decade an aerospace Satellite Interceptor System, should be made available to meet this threat as soon as technically possible. Toward the end of the 1960-1970 period, military use of space by manned and unmanned maneuvering vehicles appears to us to be feasible. Our aerospace forces must therefore be prepared to defend effectively against such space vehicles as may constitute a threat.

The Evolution of U.S. Strategic Forces

1. During the next 10 years strategic forces must be militarily decisive by providing a war fighting capability that will insure maximum possible destruction of the enemy military forces at source, which constitute a direct threat to the United States, under any conditions applying in general war.

2. In recent years, the new access of the USSR to the US and the resulting recognition of the overriding importance of

THIS PAGE IS DECLASSIFIED IAW EO 13526

the strategic mission and strategic survivability to the nation's security has been characterized by the creation of several various weapon systems, or the adaption of other forces for the strategic mission.

3. As a result, a variety of forces can contribute to accomplishment of the strategic mission today although with varying degrees of efficiency and effectiveness. The importance of the mission and the high cost of atomic delivery forces demands, in our view, that these forces be included, where available, as part of an integrated strategic effort. This is now partly provided for in the National Strategic Target List Planning under SAC.

4. In the long term, however, strategic aerospace forces must be designed and produced specifically with the strategic mission objectives as the paramount consideration and operated as a single effort in the national interest.

5. Soviet technological advances will be translated into an expanding military threat against the United States. Most significant are the Soviet buildup of ICBMs and the military implications of progressive space achievements. These advanced weapon systems are creating a further compression in time of attack and attack effectiveness. Facing this increasing threat, the U.S. strategic effort will have to take maximum advantage of technology to insure a force posture and organization that will maintain the capability to fight as well as deter a war.

THIS PAGE IS DECLASSIFIED IAW EO 13526

6. Exploitation of the complementary capabilities of both manned and unmanned aerospace delivery and reconnaissance systems will provide the best attainable war fighting capability for the United States. Whereas missiles and unmanned satellites will provide important capabilities during the period, the manned aerospace systems such as the B-70 will provide operational flexibility in tactics, targeting, weapon selectivity and reconnaissance.

7. U.S. bombers now constitute the primary means for delivering nuclear weapons to enemy targets. The brevity or lack of missile attack warning and lack of active defense against missiles are making this force increasingly vulnerable to surprise attack. Until reliable warning systems can be provided and advanced weapon systems are in-being, airborne alert can provide an important contribution to their survivability and strike effectiveness.

8. In the period, the number of medium bombers will be progressively reduced. However, during this same period, the firepower and effectiveness of the heavy bomber fleet should be increased by addition of air-to-surface missiles and by introduction of supersonic bombardment aircraft such as the B-70. These changes should permit some over-all reduction in the manned force.

THIS PAGE IS DECLASSIFIED IAW EO 13526

9. The ICBM force, as it is phased into the strategic inventory during the period, will be postured for maximum survivability and in a manner to compound the Soviet targeting problems. Specifically, these missiles will be hardened to withstand attack, dispersed to present individual aiming points, and a portion of the second generation missiles, MINUTEMAN, will be mobile.

10. In addition to the improved aerospace delivery systems that we see provided through the decade, it is essential that other elements of the total force likewise be improved. These include tactical and strategic intelligence systems and command and control elements required to provide effective direction of the forces prior to and during hostilities.

11. Introduction of operational instrumented satellites, for military purposes, will provide capabilities which are urgently needed. Most essential are the systems for warning, intelligence, surveillance and global communications. For the longer term, manned spacecraft offer employment possibilities across the complete spectrum of strategic operations; this capability must be vigorously pursued in our research and development efforts.

12. During the 1960-1970 period, if additional national strategic capabilities should be developed by allied nations, every effort should be made to insure that these separate

strategic capabilities are appropriately coordinated to present the most effective Free World strategic posture possible to attain.

13. The Free World strategic aerospace capability should be examined with a view to optimizing deployment on a global basis, integrating employment plans to the maximum extent possible, providing command and control arrangements for unified response without jeopardizing national objectives, and equipping the forces with the most effective weapon systems which Free World technology can provide.

Brief On

THE CASE FOR NUCLEAR TESTING

THE OBJECTIONS TO TESTING

1. Of the two major objections to nuclear testing, the principal one seems to be a popular notion about the earth that simply does not match the facts. Understanding of the need to resume nuclear tests, therefore, must begin with an understanding of the defects in the arguments supporting these objections.

2. Most persons believe that the earth is a large body whose only movement is an orderly rotation within the Universe. They feel that the earth lies quite still and motionless except for this rotation. To this overwhelming majority, the thought of disturbing this peace - of disrupting the quiet balance of the elements - seems somehow to be wrong. "Against nature" might be a summary of their feelings.

3. To this group, nuclear tests are unthinkable. Reactions range from the mild atomic-testing-is-changing-the-weather view to the radical atomic-testing-will-make-us-a-deformed-race position. Taken together, this kind of thinking represents a massive objection to nuclear tests. It requires

extraordinary courage to espouse testing in the face of world opinion of this magnitude. Galileo was imprisoned for a lesser challenging of the supposed order of things.

4. But the world is not an inert body. The fact of the matter - vividly demonstrated by International Geophysical Year experiments - is that our earth is in violent motion. It erupts, trembles, cracks, changes. And constantly.

5. Test advocates are calling for an order of disruption that cannot seriously be compared to disruptions that go on around us all the time...naturally. The energy involved in a nuclear test pales alongside the energy involved, for example, in a small volcano erupting.

6. Buried underground, under the sea, or in space, a small scale nuclear test would hardly jostle seismic apparatus that daily is moved by natural causes. Nor, by definition, would it contaminate the atmosphere.

7. There is a second major objection to testing. It centers about the notion that we do not need to test since we already have enough multi-megaton bombs to destroy the Soviet Union several times over.

8. This argument ignores the fact that technology has few limits. Worse, it fails to consider that there are decisive military advantages which will accrue to the nation that succeeds in solving certain problems in nuclear technology that are known to be solvable, but which require testing to solve.

THIS PAGE IS DECLASSIFIED IAW EO 13526

WHY TEST?

9. For example, miniaturizing the nuclear bomb could have a revolutionary effect on the size and structure of Free World armed forces. It could change the arithmetic of war. Costs could be reduced dramatically. Smaller warheads for missiles, of course, mean smaller rocket motors to propel them. They mean more mobility and more effectiveness. And they would be easier to hide. All at less cost. The same holds for aircraft -- they could be smaller or, conversely, the present ones could carry more weapons on each mission, making them more effective.

10. The principles of miniaturization could be applied across the spectrum of weapons, affecting sizes and costs of high yield weapons and their delivery systems, whether the delivery systems be aircraft or rockets.

11. The same sort of technological advance that would lead to miniaturization could open the way to development of clean weapons, for clean weapons would be all-fusion weapons, and all-fusion weapons would probably be significantly smaller than today's combination fusion-fission weapons. This discovery could have a startling effect on warfare and could give us important new flexibilities of option to cope with the limited threats and challenges we can expect from the Soviet Bloc.

THIS PAGE IS DECLASSIFIED IAW EO 13526

12. A logical outgrowth of this research would be the neutron bomb, the radiation weapon that would be capable of destroying all life in the area of burst while causing only negligible damage to buildings and other works of man. While this is a chilling prospect, it would be comforting if we had this weapon, grisly if the Soviets had it.

13. In addition to the need to miniaturize and to build clean weapons, vast areas of weaponry wait - stalled - for testing to be resumed. This includes exploration of the Christofilis effect - the effect an extremely high altitude release of electromagnetic energy might have on communication and weapon systems.

14. The entire field of air defense weaponry also needs modernization - anti-missiles, anti-supersonic aircraft devices, and anti-submarine warfare (which is related to air defense by virtue of the development of missile-carrying submarines). Testing would expedite achieving these sorely-needed new capabilities.

15. And there is another reason to test. Most persons assume that as we move into space with military weapon systems, the munition will be nuclear bombs. As a matter of fact, we know little about the effects of nuclear weapons in space. So a completely new nuclear technology for space combat hinges on our getting back to testing. The presently-known effects of nuclear bursts are all but useless in space.

THIS PAGE IS DECLASSIFIED IAW EO 13526

16. Blast, for example, may not be a useful effect in space, unless it can be used to propel particles at high rates of speed. Heat will be useless outside the fireball itself. And, since radiation is already present, any space system that could be affected by radiation will be protected against it to begin with. These are the three known effects of nuclear bursts in the atmosphere. So: Can we use nuclear bombs in space? Perhaps only to get a momentary bright flash to light up the pitch-black reaches of a portion of space so that we can see what is there. Without testing, however, we can only speculate. Meanwhile, the Soviets may be proceeding unmolested, searching for new applications that could be used to deny us access to space or - worse - to dominate us from there.

THE DIFFICULTY OF DETECTION

17. In addition to all these positive arguments for continued testing, there is another - negative - reason. It is persuasive to a reasonable person. It can be phrased as a question. What is the merit of not testing in the face of conclusive evidence that the ability to detect tests runs from poor to impossible? Or that verifying the fact that a test took place - beginning with the knowledge that it did take place - is next to impossible?

18. Even the most ardent of those scientists who support test bans admit that many tests would go undetected under the

THIS PAGE IS DECLASSIFIED IAW EO 13526

best of circumstances. They admit, for example, that if a test were to be set up for the purpose of trying out detection devices, and if everyone concerned knew the exact details of the test (time, size of device, etc.) - they admit that even under this kind of circumstance it would not be possible to detect all tests! That is not all.

THE IMPOSSIBILITY OF VERIFICATION

19. These same persons who argue against tests also admit that - given detection - it would still be a formidable job to establish proof!

20. This kind of problem has led to the proposal of complex, costly test detection apparati involving hundreds of manned and robot seismic stations and several hundred onsite inspections annually. Faced with an enemy that has yet to agree to the establishment of the first seismic station, this kind of proposal seems impractical, especially when the odds are heavily in favor of a determined and enterprising cheater getting away with cheating.

21. The facts are that the technology of cheating is more advanced than the technology of detecting cheaters. As we would make one breakthrough in this area, it would be possible for the Soviets to make another, thus enabling them to stay one step ahead of us in concealed nuclear testing. This rear-guard action would eventually lead to our being passed - probably decisively - in nuclear technology.

THIS PAGE IS DECLASSIFIED IAW EO 13526

22. Add to this fact the needle-in-the-haystack aspects of tests and the case against testing is, itself, atomized. There are simply too many places to hide a test. Such as behind the moon - expensive, yes, but possible. Or in a hole in the bottom of the ocean. Or in a hole in the ground. Or amongst violent solar eruptions. Or et cetera, et cetera, et cetera.

CONCLUSIONS

23. Facts such as these lead us to believe that the Soviets are testing nuclear devices. They also lead us to believe that the United States has little choice but to resume tests.

24. It _does_ take courage to advocate nuclear testing. Looked at superficially, favoring resumption could be equated with favoring arms races and war. A politician might understandably shrink from such a position because of the effect it might have on his electorate. Yet there seems no way to avoid it.

25. For there is no doubt that major discoveries in nuclear weaponry may offer strategic consequences as great as the atomic bomb in 1945 or the hydrogen bomb in 1954.

26. A fusion or neutron bomb in Soviet hands - without the offset of Free World possession - could be disastrous.

27. In the face of the facts presented here, it seems obvious that unilateral test cessation is wishful thinking. Nuclear technology will not go away if we shut our eyes. On the contrary,

THIS PAGE IS DECLASSIFIED IAW EO 13526

a one-sided ban hands the Soviet planners <u>one more</u> advantage to add to the significant ones already available to a militant aggressor uncurbed by morals.

28. They have already had this advantage since the summer of 1958. Do we dare to wait longer?

THIS PAGE IS DECLASSIFIED IAW EO 13526

(30) The Fallacy of the Concept of Graduated Deterrence

THIS PAGE IS DECLASSIFIED IAW EO 13526

Concept of Graduated Deterrence

6-4139-29

THIS PAGE IS DECLASSIFIED IAW EO 13526

AFXPD-LR

AN ANALYSIS
of
THE FALLACY OF THE CONCEPT OF GRADUATED DETERRENCE

Simply stated the concept of Graduated Deterrence calls for the United States (or, in the view of only some of its advocates, the U. S. and her allies) to develop and maintain a politico-military capacity capable of containing every conceivable type of Communist threat. Acceptance by the U. S. of the concept of Graduated Deterrence would mean the peacetime development and maintenance of a capability to fight and win (1) general nuclear war, (2) general conventional war, (3) limited nuclear and conventional war, and (4) any other type of military action ranging from military coup do etats through guerrilla actions.

Few would agree initially with the desirability of a Graduated Deterrence concept. In terms of gross military requirements, capability analysis, or survivability, it is an inherently attractive strategy on-the-surface.

However, since its proponents have never subjected the concept of Graduated Deterrence to close scrutiny or careful analysis, its efficacy apparently has been tested only against its emotional appeal and its psychological attractiveness. Measured against any realistic criterion (such as the actual availability of national resources for national defense purposes) it becomes but one of an ever-increasing series of deterrent concepts (or labels) whose real utility is to be found only in public speeches or as a delaying tactic to honest attempts of evaluating realistic strategic alternatives.

The case for Graduated Deterrence becomes suspect, or fails, for at least five reasons:

- First, one of its basic premises states that the spectrum of protracted conflict may be subdivided into clearly divisible

THIS PAGE IS DECLASSIFIED IAW EO 13526

threats and responses. It calls for a division of military forces into separate categories, such as limited and general war forces, with no meaningful standard for accommodating multiple capacity weapon systems (e.g., carriers, aircraft, missiles, etc.)

- Secondly, it prepetuates all types of traditional warfare as being of equal likelihood or prospect in the future.
- Third, it fails to evaluate the capacity of one type of force structure to perform, or contain, any other type or level of conflict.
- Fourth, it apparently ignores the national requirement to assign priorities to national military tasks. In other words, it either ignores the "cost squeeze" or it calls for seemingly unlimited allocations of national resources for national defense purposes.
- Fifth, and finally, it seems to avoid realistic adjustments to technological progress in weaponry and the principle of "target accessibility" with which such progress has been inherently associated.

Until the advocates of the Graduated Deterrence concept answer each of these substantive questions, national acceptance of their point of view cannot be tolerated. Each of these basic questions will now be developed in more detail.

THIS PAGE IS DECLASSIFIED IAW EO 13526

On the Divisibility of Threats and Forces.

Few would argue with the contention that the spectrum of Soviet military threats ranges from general nuclear warfare through internal subversion activities, or from clearly strategic threats to harassment and nuisance measures. Yet, even though the extremes or poles of the spectrum of Soviet military threats can be rather clearly identified, it is far more difficult to subdivide the total spectrum into clearly distinguishable sub-sections, or elements, assign priorities thereto, and develop capacities for containing them.

For example, if the Air Force were to consider its variety of operational aircraft and missiles solely as "strategic" or "general" war weapons, as some proponents of Graduated Deterrence have suggested, it would mean restricting the USAF to one specific role, thereby eliminating the inherent mobility and flexibility characteristics of aerospace power. What it would also mean, however, is that the Army, Navy, and Marine Corps could accelerate the development of their own "air forces" to fight any type of warfare not considered "strategic."

Secondly, another division of our military forces into units capable of containing separate communist threats calls for classifying all U. S. military forces into "offensive", "defensive", and "support" forces. This categorization, besides having all the disadvantages of further dividing various elements of aerospace power, ignores the problems of classifying "multiple-capacity" weapons. If the MINUTEMAN is developed as a multiple-capacity weapon (ICBM and Anti-ICBM), to which force should it be assigned? Offensive or defensive? How would space vehicles which combine offensive, defensive, reconnaissance, navigation, and telecommunications capacities in one vehicle be classified?

0816

Moreover, a separation of U. S. Military forces into "general" or "limited war" forces, or into "offensive" or "defensive" forces, also rests on the assumption apparently that modern warfare can also be divided into distinctive land, sea, and air warfare. This clearly is a reactionary suggestion which has no acceptable rationale in face of modern weaponry. In fact, it is a reversal of modern doctrine which insists that distinctive types of warfare fought by distinctive types of forces is gone forever. We need one single military force, singularly-directed under a single, over-all strategic concept, not three or four concepts each funded to the extent that we lack adequate capability in the really essential areas of security policy.

On the Prospects of Traditional Type of Warfare Repeating Themselves:

Beyond the contingencies that there may be greater prospects for definately limited military actions in Southeast Asia, the Middle East, and Africa in the next decade, the probability of vast wars of attrition in which the U. S. or its major allies may become envolved seems clearly to have passed its zenith in World War II. Yet, in face of what has been called a "nuclear stalemate", the advocates of Graduated Deterrence visualize an international order in which there is growing prospect for seemingly unlimited types of conventional war to occur. In other words, nuclear weapons, high speed aircraft, and the like will never be used in combat. Put another way, the U. S. should develop and maintain in peacetime a conventional war structure perhaps not much smaller than that military force built in World War II. This is the type of military force structure the U. S. should maintain!

How "tactical" missiles of 800 to 1500 mile range fit into this concept is not clearly understood?. How Polaris submarines, B-52's, and ICBM's fit into this concept is also not clearly understood, let alone military space vehicles.

Although at the insistence of the Congress, beginning next year the Military Assistance appropriations will be considered "in competition" with our "own defense expenditures", the Graduated Deterrence concept apparently does not take into account the tremendous conventional forces we have built abroad over the last ten years with our Military Assistance programs. Having built these "shield" forces to contain local aggressions, the U. S. must apparently duplicate that capability. Yes, duplicate that capability even at the expense of our own strategic and space needs - so the Graduated Deterrence advocates would insist.

The Graduated Deterrence concepts offers no answer to the question of "how much is enough" for the various tasks the U. S. Military establishment might be called upon to perform. It ignores their question completely as well as the inherent versatility and flexibility of modern weapons.

On the Capacities of Various Types of Force Structures:

To the proponents of Graduated Deterrence, no one military force is capable of performing any other function than that for which it was designed. In other words an effective and credible second strike, counterforce, strategic capability does not reduce the prospects of other types of warfare, In fact, it increases them.

This perhaps is one of the most important questions which has not been answered by the Graduated Deterrence spokesmen. Perhaps no one can answer satisfactorily (short of an actual conflict) how far a nation would go in

a military action before launching its strategic capability, or from what it actually would be deterred when its major adversary possessed a credible war-winning force. What can be said, however, is the the possession by the United States of a credible counterforce capability does deter other levels of conflict from developing, or, at least, it greatly reduces their possibility.

Moreover, the possession of an adequate counterforce capability reduces the necessity for maintaining other types of military forces at levels adequate to contain various types of military actions in the absence of a credible, counterforce capability.

This line of argument does not rest on the premise that a war-winning, strategic, counterforce capability is adequate to contain all levels of conflict. What it does offer as a major premise, however, is that a credible counterforce capability reduces the prospects of "large limited" wars, or of conventional, general wars. Thus, for the limited types of military conflict which may develop, the U. S. need only maintain a limited war force of a size adequate to "back-up" its allies as a "reserve".

The Cost Squeeze and National Military Priorities:

Over the last four years national defense expenditures have been held to a level of approximately $40 billion per annum. As a result, national military activities have received a decreasing precentage share of the Gross National Product, which has been increasing at a rate of 3 to 5% per year.

Over this same time period, the costs of various military functions have increased greatly. Today, active duty military personnel costs are almost the same as they were at the end of the Korean conflict when there were one million more men in uniform. Research and Development allocations now approach 10 to 12 percent of the total Defense budget.

THIS PAGE IS DECLASSIFIED IAW EO 13526

And the trends are all upward! For example, retired pay now averages some $400 million per year for the total Defense establishment. Within a few years, retired pay alone may reach the $2 - 4 billion annual level of expenditure.

The unit costs of weapons is also upward: F-80's priced out at $80,000 an item; F-86's at $500,000; F-100's at $750,000; and now F-105's cost nearly $2 million an aircraft. The same geometric increase in unit costs is characteristic of Army Air Defense weapons (the Hercules Battalion costs twice the Ajax Battalion it is replacing) and Naval carriers. In other words, all the Military Services are purchasing more costly equipment.

Concurrently, we have been allocating more and more of our relatively limited defense resources to survivability measures, such as airborne alert, base hardening and dispersal, the pre-stockage of military equipment, etc. The ultimate impact of these cost increases has been seen in a great reduction in the funds available for the purchase and support of offensive weapon systems and forces.

Yet, in face of these trends, the advocates of Graduated Deterrence insist on more and more resources for every military claimant. This argument is offered when at the same time priorities are being considered for certain national military tasks. We are not allocating enough resources to satisfy every claimant, so priorities must be assigned. To this requirement, Graduated Deterrence spokesmen are silent. They merely insist that everyone should obtain everthing he needs. Where is the principle of collective balance found in this approach? Or, what standards are used for assigning priorities under such a concept? These fundamental questions need answering.

THIS PAGE IS DECLASSIFIED IAW EO 13526

On the Technological Revolution in Weaponry:

One of the new characteristics of modern weaponry is the potentiality of many modern weapons to perform a variety of separate military functions, irrespective of the military service to which such functions may now be assigned. A tactical missile unit may fire at a variety of targets with a variety of warheads at ranges from 20 to 1500 nautical miles. With such weapons, debates over Service responsibilities or functions, and between what targets should be considered "tactical" and "strategic", are far more then academic questions.

They envolve the very future of the separate Services. In the absence of decisions in these very substantive areas, duplication of military capability among the Services becomes the norm, rather than the unusual. It is costly to the national military effort as a rule in that it actually endorses a mis-allocation of scarce national military resources.

Moreover, it ignores the principle of "target accessibility" and the real impact of the shrinking time element in the conduct of military operations. It fails to recognize the importance of survivability in the missile and space eras and underemphasizes the impact of new developments on classical types of warfare.

Thus, the Graduated Deterrence concept calls for developing a "new" capability every time a technological break through in weaponry occurs without a compensatory reduction in any existing or classical capability. Such a concept is in fact highly unrealistic. It seems to ignore the "hard" decisions by merely building a case for more, and more, and more national resources being allocated to military purposes. In other words, it calls

THIS PAGE IS DECLASSIFIED IAW EO 13526

for a marriage of 19th Century military capability with a 20th Century threat. All new developments in weaponry become additional requirements. No concept or force is ever retired. Yesterday's way of doing our military business is seemingly continuing forever -- even in space!

THIS PAGE IS DECLASSIFIED IAW EO 13526

(32) The Need to Strengthen Our Alliances

THIS PAGE IS DECLASSIFIED IAW EO 13526

engthen Our Alliances

6-4139-31

AN ANALYSIS AFXPD-LR
of
THE NEED TO STRENGTHEN OUR ALLIANCES

1. Free World political circles are increasingly concerned over nationalistic trends and the resulting weakening of our NATO and SEATO alliances. The recent decision of the NATO Council to commence long range planning reflects this concern.

2. The search for a collective defense effort against the Soviet threat to the Free World periphery motivated the establishment of NATO, SEATO, CENTRO, and the many bilateral security arrangements which the U. S. has entered, and continues to provide the main rationale for these alliances.

3. In recent years both the nature of the Soviet threat, and the capabilities of many members of the Free World alliances to provide for their own local defenses (shields) have changed.

4. Through 1955, the primary Soviet threat was to the peripheral areas -- and means to counter it received dominant Free World consideration. This led to massive U. S. military aid programs and the peacetime basing of U. S. forces in allied countries to offset the lack of local "shield" strength.

5. Since 1955, the U. S. has had to give increasing attention to the Soviet ICBM threat and to Soviet space and nuclear achievements. Concern in the U. S. is now more with the missile gap, with the survival of our retaliatory forces, and with space developments than with the direct threat to the peripheral areas.

THIS PAGE IS DECLASSIFIED IAW EO 13526

6. At the same time, the impact of past U. S. aid programs has improved allied economies, and allied technological capabilities in new weapons, and has made it possible for our allies to increase their capacity to provide for their own local defense (shield) forces.

7. The principle effects of the improvement in allied forces and the new direct Soviet threat to the U. S. include:

a. A decrease in the likelihood that the U. S. will use its strategic sword to defend against peripheral aggression in all areas.

b. A decrease in the need for peacetime overseas deployment of U. S. forces to assist local (shield) forces under current concepts.

c. An increase in the possibility of a war between the U. S. and USSR in which peripheral areas might avoid becoming active battlefields.

d. Increased incentive on the part of major allies to provide their own strategic nuclear deterrent capabilities -- both for prestige and to offset (a) above.

8. The over-all impact of these effects on our alliances is to reduce the value of collective security and the integration of defense efforts as motives for solidarity. The principle that Free World nations have to "hang together or hang separately" is giving way to the thought by some that possibly the best way not to "hang" at all

THIS PAGE IS DECLASSIFIED IAW EO 13526

is to retain freedom of choice when it comes to participating in future wars.

9. Since the shrinking world trend continues with its population expansion, and the resulting need for closer ties among nations, the fundamental goal of allied solidarity remains valid. This being true, the above arguments suggest the continuing need to improve our alliances must be met by fostering collective interests in areas other than security.

10. In summary, the research for collective security is losing its value as a catalyst to allied solidarity. Unless economic, political, and cultural goals, our alliances, built upon the basis of the latter, will get progressively weaker instead of stronger.

11. The merger of security forces was tried as a path to federation in Europe in 1950/52. The E.D.C. failed when it became clear to the participants that their national security interests were not all identical. The same will be true of the NATO alliance. A point is reached in any evolution towards allied solidarity wherein the integration of security forces must await and follow political and economic integration and not the converse.

Conclusion. In the interest of Free World solidarity and alliances we need to revise our security policies to take into account the new global weapons, the new allied capabilities, and the new security requirements and the political attitudes of member nations. Emphasis

THIS PAGE IS DECLASSIFIED IAW EO 13526

must henceforth be on political and economic integration rather than on military integration.

STRATEGIC THOUGHTS ON THE BERLIN ISSUE

THIS PAGE IS DECLASSIFIED IAW EO 13526

B/Gen R. C. Richardson
27 July 1961

Some Strategic Thoughts on the Berlin Issue

The Right and Wrong Way to go to War over Berlin

The NATO aim in its effort to raise the threshold of atomic response is to cause the USSR to "pause and consider the implications of its act of aggression."

The idea, as developed in speeches and testimony by SACEUR, seems to be to create if possible a conventional capability cushion, or shock absorber, which would allow NATO to defer an immediate general atomic response to every manner and type of incursion or local act of aggression in the NATO area.

The "pause" concept presumes by its very nature, not only that the enemy is the aggressor, but also that his act of aggression includes in some form the penetration of NATO frontiers or NATO air space.

Inherent in the pause concept is the idea that NATO is on the defensive, and is willing to trade territory for time in which to discuss the implications and consequences of the Soviet act of aggression before resorting to an atomic defense.

Recently, there has been an attempt, in both the public press and officials circles, to relate the "pause" concept to the Berlin situation. The idea seems to be that NATO can, by some form of military maneuver, cause the Soviets to desist from operations to deny the West access to Berlin by forcing them to contemplate the consequences.

0834

The truth of the matter would seem to be that, in the case of Berlin access, the NATO "pause" concept is reversed. By virtue of the geography of the Berlin situation, and of the difference in the characteristic and scope of military operations required; on the one hand to deny, and on the other hand, to reopen, access to Berlin the Soviets become the ones who can force NATO to "pause" and contemplate the consequences of any operations we might initiate to reopen access.

Access to Berlin can be denied by local Soviet/GDR military operations which do not violate NATO frontiers; do not cause NATO civilian casualties or loss of property; do not threaten NATO security or the defense capability. Article 5 of the NATO Treaty in this case would apply only if we invite an attack on our NATO forces by pushing them across East German territory towards Berlin.

Access to Berlin can only be reopened by allied military operations which involve the seizure of some East German territory; the attack of air bases and missile cities at some distance from Berlin; the probable destruction of civilians and civil property; and the severence of GDR North South lines of communications like the Elbe river. These acts would clearly invoke the defense provisions of the Warsaw Pact if they have any validity at all.

Thus, it seems very clear that military operations to reopen air or land access to Berlin, in the face of an effective Soviet or GDR

blockade, can be kept limited and hence non atomic only at the expense of certain defeat.

If we use force for more than to determine the enemy's intent to resist, we will unquestionably find ourselves faced with the alternatives of deliberately enlarging the conflict and invoking the Warsaw Pact, or accepting local defeat. At this juncture the allies will be the ones that must raise the threshold and in so doing contemplate the consequences of our actions.

Thus, the NATO "pause" concept is clearly not applicable in the case of Berlin access operations - it is in fact reversed.

Under these circumstances, the use of allied military forces in an attempt to reopen access to Berlin would make no sense. It would merely result in a general atomic war started in a location and under circumstances most disadvantageous to the allies, to include their being clearly responsible for its initiation.

If Berlin access is denied by force, the allied objective should be to create circumstances under which the Soviets, not the allies, have to either back down or initiate general war. This cannot be done by local military action in the Berlin area. It might be done, however, by reacting to a forcefull denial of access to Berlin with the progressive application of global constraints on the USSR until these become so objectionable that the USSR is forced to negotiate Berlin access in return for their removal, or seek their removal by

aggressive use of forces. If this latter course of action occurs, the "pause" concept can again be rationally applied.

We should be quite clear as to the criteria of an act of aggression responsible for general war.

If we wish to place the onus of starting a general war on the Soviets, they must be forced to initiate military operations of a scope and nature which obliges us to clearly invoke article V of our Defensive NATO Treaty.

Conversely, if the allies are placed in a position where their military operations are of a type to logically invoke the defense provisions of the Warsaw Pact, even though even though they may be in pursuit of a local objective, the onus of expanding the conflict will be charged to us by most impartial observers.

More important than "who starts the general war," is the fact that he who initiates military operations, that justify the other invoking his Defense Treaty, surrenders the strategic initiative to the other. The conclusion here is that if either the allies, or the Soviets, are faced with the need to initiate such operations, they should instead implement their strategic general war plans in the first place.

Since the allies are not likely to deliberately argue to go directly from, say, a Berlin probe to a SAC attack - whereas the Soviets might in a similar situation - our strategy must be based on exerting military pressure in places, ways, and means that will force the Soviet to escalate in a manner which would justify allied initiative in the ensuing general

war exchange.

In summary, allied strategy in response to a local Soviet effort to deny access to Berlin, should be to apply counter measures in other areas of the world in an effort to "mousetrap" the Soviet into a local situation advantageous to us in that they will then have to risk local military operations that will justify our invoking article V of the NATO Treaty. This would occur if they can be faced with an intolerable constraint (e.g. closure of the Dardanelles, etc) and a choice of relieving it by force only at the expense of:

a) Ignominious local defeat,

b) Starting a general war they were not ready for,

(OR)

c) Gambling that a limited effort large enough to succeed (e.g. seizure of the straits area) would not cause us to invoke Article V, accuse them of aggression and seize the initiative in the general war that would ensue.

The attached charts indicate the right and wrong way to escalate into general war over an issue like Berlin.

THIS PAGE IS DECLASSIFIED IAW EO 13526

The Right Way to go to War over Berlin.

	GDR/Soviet Action		Allied Reaction
I	GDR/Sov block autobahn to Berlin, by any means.	I	Allies probe to determine that Sov. intends to deny access by force.
II	Sov/GDR react to Allied probe with military forces or demolitions backed by force.	II	Allies apply progressively all non military retaliatory measures available, and initiate essential airlift to Berlin.
III	Sov/GDR interdicts Air LOC to Berlin with force-fighters ASMs, Electronics, etc..	III	Allies begin to apply forcefull retaliatory measures globally. (e.g.) blockade straits, isolate Cuba, deny civil air transit, etc..
IV	Soviets react to objectionable global constraints with local aggressive action to overcome (e.g.) escort airliners outside USSR; seize Dardanelles; attack Cuba blockade forces; etc..	IV	Allies defeat local Soviet offensive to relieve intolerable allied measures with whatever force necessary, including air, sea, and missiles based outside local area.
V	Soviets are faced with choice of accepting local defeat - (or) extending the war by attacking allied forces at source - If they do the latter then:	V	Allies can invoke Article 5 of NATO Treaty, tag the Soviets clearly as the instigators of general war, and seize the initiative in a general war response.

The Wrong Way to go to War over Berlin

I	GDR/Soviets block access to Berlin by any means.	I	Allies probe Soviet intent to use force to deny access.
II	Soviet/GDR use of force or demolitions backed by force is established.	II	Allies launch local effort down autobahn to try and reopen access and establish airlift.
III	Soviet/GDR defeat local force (Bns or above) and deny airlift with fighters and ASM's.	III	Allies expand effort to reopen in preference to accepting de-feat, and seek to protect air LOC by attack of missile sites and fighter bases.
IV	Soviet obliged to invoke Warsaw Pact by expanded allied air and land effort; accuse allies of general aggression; and seize the general war initiative.	IV	Allied forces and bases in NATO, that support the Berlin effort are hit; probably with concurrent global strikes by Soviets, thus giving then general war initiative.

THIS PAGE IS DECLASSIFIED IAW EO 13526

AN ANALYSIS OF THE EVOLUTION OF NATO
DEFENSE CONCEPTS

THIS PAGE IS DECLASSIFIED IAW EO 13526

OFFICIAL USE ONLY

Cy Fo Gen. PARRISH

AN ANALYSIS
of the
EVOLUTION OF NATO DEFENSE CONCEPTS

The Situation

In 1954 NATO's number one job was to devise a defense strategy for Western Europe that would offer reasonable prospects of arresting an attack :

- by numerically superior forces

- as "far to the east" as possible.

At the Lisbon Conference (1952), NATO recognized that, for economic, political, and geographical reasons, there was no hope of matching the Communist D-day order of battle that faced Western Europe; it was equally apparent that the disparity in strength between NATO and the USSR would increase as wartime build-up's took place on both sides. Related to these conclusions was the fact that the objectives of the NATO Alliance could not be met by a strategy, or by defense plans, that envisioned at best the overrunning and subsequent liberation of major areas of member nations adjacent to the iron curtain.

The need to conduct a successful forward defense, with inferior forces, led to SHAPE's 1954 atomic defense strategy, MC 48, and to the 1956 Political Directive which reflected it. MC 48 was almost entirely based on a SHAPE defense plan with a concept of operation which, not only exploited fully atomic firepower in the defense of Europe, but also envisioned extensive, if not radical, changes in the organization, deployment and employment of NATO forces, so as to maximize the effectiveness of new weapons, and survivability.

From 1954 to 1961 the change in NATO defense concept, with full reliance on atomic weapons, was accepted. On the other hand, the related, and equally important, accompanying changes in force organization, deployment and employment were not. The result of this partial implementation of the original SHAPE Atomic Defense Plan requirements has been :

- a steady "backsliding" in NATO's capability to meet the two criteria in the first paragraph above;

- a decrease in the confidence that front line countries have that NATO can provide for their security; and,

- as a result, a growing weakening of the Alliance.

A clear understanding of the reasons for the above developments and trends is a prerequisite to correcting them. This is the purpose of this analysis.

OFFICIAL USE ONLY

THIS PAGE IS DECLASSIFIED IAW EO 13526

The Original SHAPE Atomic Defense Concept

If one were to have equipped Napoleon's forces with machine guns, without changing their close order formations and the tactics of that era, the results would have been catastrophic. Yet, this is exactly what is being done today when the military merely adds atomic firepower to land and air formations that still retain the conventional war configurations, and tactical doctrines, of Korea and World War II.

In 1954, when SHAPE presented its "New Approach Plan" to member nations and to the Standing Group, both the Plan and all briefings given of it, concluded that it was theoretically possible to hold on or close to the frontier and against an attack by superior forces, if NATO used atomic firepower; PROVIDED :

a. Atomic weapons were in the hands of troops at all levels on D-day, AND

b. The first echelon land and air forces were reorganized, redeployed and re-trained as necessary to optimize the effects of atomic firepower against an attack.

The first requirement, a above, stemed from the fact that the very nature, and speed of action, of atomic warfare would preclude effective, post H-hour distribution of weapons, or redeployment of delivery systems.

The second, and most important, requirement, b above, resulted from SHAPE studies of the impact of atomic weapons on the ability to defend on land, particularly : the new role conferred on firepower; the decisive importance of relative force vulnerability; and the advantages conferred on the defense over the offense on land. A failure to adjust to these new conditions, while using atomic weapons, was clearly recognized in 1954 as equivalent to sending cavalry in close order formation up against World War II automatic weapons. Today this lesson seems to have been lost, without having been disproved.

What Happened to the Original Concept

The MC 48 concept, though accepted by NATO, was never fully implemented by the military in practice. The idea that "mass", or quantity of force, was not a dominant factor in an atomic war, and that as a result it is now possible to conduct an effective forward defense with smaller forces than the enemy, was readily accepted since this met the economic and political aspirations of governments. On the other hand, the related need to place atomic weapons in the hands of troops was resisted

0845

THIS PAGE IS DECLASSIFIED IAW EO 13526

for political as well as parochial reasons, as was the related reorganization of the land and tactical air forces and a revision of their tactics. Though studied for one or two years, the latter requirement was defeated by reactionary elements within the military, who resented both the reductions in force and defensive role that full acceptance of atomic firepower conferred on land forces.

Resistance to full integration of atomic firepower, and to the related adjustments in force quantity and role, was accompanied by efforts to limit targetting and weapon sizes so as to reduce incidental damage to non-combattants. This in turn reduced the usefulness of the atomic firepower in the land battle and increasingly limited its use to counter air and deep interdiction operations. At this point we have all the elements that have forced a regression in our ability to conduct a defense "on the frontier" or "to offset greater quantity of force" since both these goals relied mostly on atomic counter land force tactics.

If the SHAPE mission is to prevent the overrunning of forward areas, and not to advance or try to win the war alone, the mission can be accomplished, provided we accept atomic counter-force and atomic interdiction programs. The extent of the atomic firepower required will vary directly, however, with the defender's ability to locate "form up" and hit enemy land and air force targets. This ability in turn depends on the emphasis placed on NATO front-line forces that are trained, organized, equipped, and deployed so as to "form-up" and quickly identify enemy invading forces for selective atomic destruction. The SHAPE MC 48 submission envisioned a major effort to man an atomic barrier with "dug in" land formations supported by effective battlefield reconnaissance and a full spectrum of integral and air-delivered atomic systems. Today's land forces are essentially deployed, organized, trained and equipped for classical conventional, defense in depth, mobile type of operations of the World War II variety to which has been added a few atomic missiles and artillery units in a purely supporting role at Corps or Army level.

If NATO had force levels far below those that now exist and was willing to accept a wide band of total destruction in Europe, along with the fallout associated with it, the forward defense concept of MC 48 could be accomplished. If, on the other hand, NATO desires to approach the optimum in civilized warfare by defending Europe against larger enemy forces, while destroying only military targets, this would call for a fairly high level of forces to accomplish the "form up" and "detection" tasks in support of the selective atomic firepower needed to meet this criteria. Probably something on the order of the thirty divisions now called for in Central Europe. Even at this level the success of a forward defense depends on these units being used to support the firepower and not the converse. This is what NATO seems to have lost sight of or refuses to accept. Yet if this reasoning is wrong, then the whole basis of MC 48 was wrong.

When, as is now the case, NATO restricts the size of atomic weapons and

type of targets -- to reduce incidental damage -- and, at the same time fails to reorganize, train and deploy forces to optimize its atomic firepower in a local counter-force role, all that the atomic capability provides is a cheap means of delivering the counter-air and interdiction effort that previously demanded hundreds of sorties. The last world war proved that air interdiction of lines of communication alone would not prevent the sustained commitment of sizable land forces. Atomic defense plans which do not involve tactical counter land force operations, with all their implications, merely provide for a conversion of the classical air effort to an atomic exchange, while permitting the land forces to fight in World War III fashion in which advantages of "mass" remains as does the likely overrunning of sizeable forward areas.

The chain of reactionary events that have led to the present situation in NATO can be summarized as follows :

a. Failure to accept and implement the need for a full spectrum of weapons in the hands of forces;

b. Failure to recognize and implement the land and tactical airforce tactics and force postures and levels essential to optimizing atomic firepower;

c. Progressive reduction in size of weapons and targets allowed, to an extent that eliminates full exploitation of tactical counter force operations;

d. A steady fall back in the forward MLR position in SHAPE EDP's that can reasonably be defended even with atomic weapons as a result of a, b, and c above;

e. Increases in the duration of the so-called "pause" and in conventional force requirements and defense costs, all at the expense of the surrender of more and more territory.

The net effect of the above trends is to largely negate the value of atomic weapons towards both offsetting "mass" or holding along on the frontier. Meanwhile the conventional effort, being contrary to technological evolution and cost trends, has no staying power, let alone "mass". The result, NATO will soon have NEITHER a conventional NOR an atomic capability if these conditions are not recognized, studied, and corrected at an early date.

THE FOUR PRINCIPAL ARGUMENTS AGAINST A "DUAL" or "CONVENTIONAL" NATO DEFENSE

THIS PAGE IS DECLASSIFIED IAW EO 13526

I may submitt this as an article for the A.U.Review redoing in the positive sence for clearance : EG

"The arguments to be overcome to achieve the desired conventional capability"...

This should get it by the amateurs that review it and yet make it clear you can't overcome these...

A 40

THIS PAGE IS DECLASSIFIED IAW EO 13526

THE FOUR PRINCIPAL ARGUMENTS AGAINST

A

"DUAL" or "CONVENTIONAL" NATO DEFENSE STRATEGY

1. This paper argues that there are four major reasons why the current attempt to incorporate into NATO forces in Europe a so-called "dual" capability is unsound, and why efforts to implement a defense policy along these lines will only lead to failure in the long term.

2. This conclusion is not based on whether or not such a "dual" or "conventional" capability is desirable. The arguments in favor of an effort in this direction are impressive. Such a defense policy is of little or no value, however, if the achievement of a truly valid conventional capability is not feasible in this day and age. Worse, it is a dangerous policy if the attempt to implement it defeats the purpose of the Alliance it is supposed to serve. In varying degrees both of these conditions seem to apply in the present instance.

3. First, the development of either a dual capable or conventional defense posture in Europe requires that again we accept to some degree the classic principles of mass wherein relative capabilities are measured in terms of relative quantities of men and machines as in World War II and Korea. Most costly modern weapon systems have been geared to atomic warfare, wherein mass or quantity is secondary to performance or quality. Since the "mass" factor in atomic warfare is measured in terms of firepower -- KTs and MTs delivered -- rather than in terms of manpower and numbers of delivery vehicles, it has been possible in recent years to sacrifice quantity for quality, both in front line and mobilization capability. Any attempt now to provide the quantity of modern weapons required for sustained non-nuclear warfare is economically prohibitive, and even if possible, makes no sense from a cost effectiveness point of view. Such a strategy also violates the first law of sound defense policy, to wit :

> Defense concepts and strategies must fully accept the products of, and evolve with, weapon technology.

4. Second, the value of NATO to member nations lies in the fact that the coalition or Alliance offers them security. Security in this case means not only defense of freedom, but also protection of life and property from aggressors. The last two elements are unfortunately all too often overlooked. In this discussion they are all important, since a strategy that at best will lead to the overrunning and subsequent liberation of front line members of the Alliance will not provide their people an acceptable degree of security. A conventional defense in NATO Europe must, by its very nature, trade territory for time and maneuvering room. It cannot hope to stop the

invaders on the frontier as is the case with a fully effective, immediate atomic fire-power defense. The conventional, or dual defense strategy therefor, while superficially attractive, has within it the seeds of dissolution of the Alliance.

5. In light of these two rather fundamental facts, the principle arguments against such a strategy are summarized in the following paragraphs. Again, the reader must keep in mind that none of these arguments attempt to deal with the "desirability" of the policy, but only with its "feasibility", and with its long term "impact" on Allied solidarity.

Gambling Force Survival on Enemy Intensions

6. A basic principle of command has always been to anticipate the worst the enemy can do, and prepare to deal with it. No commander can rationally risk the survival of his forces, or the success of his mission, solely on an estimate of the enemy's intentions. While enemy intentions should be taken into consideration, sound defense plans must always be based on enemy's capabilities.

7. The USSR has the capability to utilize atomic weapons against Allied forces in Europe. Under the above principle, a sound NATO defense policy must provide Allied forces with the capability to survive, and to accomplish their defense missions, in the event the Soviet elects to attack with nuclear weapons from the onset.

8. Dispersion, hardening, and rapid reaction measures must be emphasized if NATO forces in Europe are to survive a sudden atomic attack. These measures can only be fully exploited at the expense of major reductions in quantity and concentration of forces, and hence in the ability to sustain conventional military operations which depend on these characteristics.

9. It is obviously possible to compromise the conflicting demands of atomic survivability and conventional readiness, but pnly at the expense of both capabilities, since in modern war the optimum force "posture" to survive, and respond to an atomic attack, has many characteristics which are the antithesis of those required to effectively respond to a conventional attack. This development was clearly recognized when NATO accepted, in MC 48, the concept of an atomic defense of Europe from the onset, and began to redispose and reorganize the forces accordingly. It now seems to have been lost sight of in NATO discussions of current and future defense policy.

10. It is sometimes argued that we can maintain a "dual" capability provided we provide our atomic delivery forces in Europe with all appropriate survival measures to protect them from sudden atomic destruction. This view recognizes that the forces required over and above these for the conventional phase of operations, would contribute little or nothing to the outcome of an atomic conflict and can therefor remain concentrated and exposed, even if this leads to their loss in the event that the enemy elects to launch an atomic attack. While true in theory, the weakness in this argument

is twofold : First, it presumes that an enlightened public will risk theloss of citizen soldiers on a judgment of enemy intentions, in the hope of thereby preventing atomic war; and, second, it ignores the impact that massive losses will have on the effectiveness of the residual atomic delivery capability. This latter problem was also recognized in early SHAPE atomic defense planning under the title of the "theory of tolerable loss" and again seems to have been lost sight of.

11. Governments, and the people they represent, expect both their military and political leaders to take all possible steps to insure the safety and survival of their military personnel, even in war. To place troops in a position, vis a vis the enemy, which admittedly accepts the fact that they can be slaughtered at the will of the enemy, as must be done to retain a valid dual capability, should be politically unacceptable. Yet that is exactly what must occur if we seek to build up and concentrate sufficient forces in Europe to sustain a valid conventional effort. This fact suggests that even though there may be philosophical reasons, or other rationalizations, for risking the survival of our citizen soldiers on an estimate of enemy intentions, the public and Allied support we can expect for NATO defense policies that do this will decline when the implications of these policies are fully understood.

12. The simplest way to explain the "tolerable loss" problem is to compare the capabilities that would exist if, on the one hand, half of NATO's airbases were completely destroyed, as against those which would exist if, on the other hand, one half of each NATO base were destroyed. In both cases the force and weapon inventory remains the same. In the former case, however, the capability to carry out defense plans would be about 50% whereas in the latter case it would probably be close to zero.

13. Experience has shown that there is a limit to the "time-rate of loss" that any one organization can sustain before command and control factors, psychological factors, damage recovery problems, etc., become so acute as to wholly eliminate the residual combat capability of the whole. If we continue to expose 70 to 80 percent of our air order of battle, for instance, on a few score bases, and deployed thereon within the diameter of a fireball, most of these would be destroyed by an enemy atomic attack. The fact that we might have saved by special measures the 20 to 30 percent essential to our planned atomic response does not therefore mean these remaining forces can successfully carry out the planned defense of Europe in the atomic war that ensues.

14. This brings us back to the first law of sound defense policy planning and that is that : "Concepts and strategies must evolve with technology." As applied in this instance, it means that the advent of nuclear technology, space systems, and other modern weapons demand that out NATO concepts, both for offense and defense, accept and be fully adjusted to these developments. If we wait to do this, as is the trend in some current planning, and violate time-honored military principles, such as gambling on intentions rather than capabilities, we will set NATO up for a decisive defeat - at worst, and weaken the Alliance, at best.

THIS PAGE IS DECLASSIFIED IAW EO 13526

On the Ability to actually implement Concepts.

15. Military defense plans and concepts on which the security of NATO depends, must be realistic and as realizable in practice as possible. Major requirements which past experience has clearly shown to be essential to their successful implementation should never be intentionally overlooked or omitted.

16. There is some evidence that current political desires to avoid, if possible, the use of nuclear weapons, atleast in the initial phase of any hostilities in Europe has resulted in blatant disregard of the above principles. The long period of peace we have enjoyed since the last war, and the revolution in military technology of recent years, have unfortunately combined to create a new "law" which seems applicable to much of NATO's conventional war planning, to wit:

> "Practical military measures which limit the achievement of those concepts that are 'aspired to' by military, or political, leaders are rationalized away to an extent that varies directly with the remoteness of the last military experience."

17. Following the experiences of World War II, Allied plans for non-nuclear war laid great, if not overriding, stress on the need to sustain all forces committed to combat. Forces can only properly be committed to military operations in which the anticipated loss rate would clearly exceed the ability to provide replacements as a last resort. When this occurs the nation is in the position of individuals whose expenses exceed their income and who commit capital, recognizing that this can only lead to bankruptcy. The need to create a capability to sustain forces in combat was the principal reason for the delay of the invasion of Europe until 1944, and also governed the rate of operations of the strategic air effort from England.

18. In atomic warfare, the problem of sustaining operations over long periods does not arise. This results from the fact that the amount of atomic firepower, and of delivery vehicles, on hand on D-Day can far exceed the maximum essential to accomplish any planned destruction. If there are doubts about this quantity, it can be doubled and still stockpiled. Under these circumstances, if a decision is not arrived at as a result of the immediate delivery of firepower of this magnitude, any additional in firepower that could be mobilized and brought to bear, can hardly hope to influence the outcome. This is why Allied plans have always recognized that an atomic war would be largely decided by the results of the initial atomic exchange.

19. In recognition of the fact that sustained operations and "mass" of force are not as important to success in atomic wars as they are in non-atomic wars, many nations have sacrificed quantity for quality, particularly in the more sophisticated and costly air and naval weapon systems. NATO has gradually integrated over the years, new high cost delivery systems, such as supersonic fighters, tactical missiles, Nike and Honest John battalions, etc. None of these systems were bought in sufficient quantity to provide for sustained losses, nor was money spent to stockpile and otherwise plan and prepare an industrial mobilization base from which replacement could be

THIS PAGE IS DECLASSIFIED IAW EO 13526

rapidly obtained. In the air, at sea, and to a lesser, though to a marked degree, on the ground, the compromise between quality and quantity has emphasized the former at the expense of the latter. This is only logical in recognition of the fact that the advent of atomic weapons not only permits this, but also allows us to obtain the more sophisticated systems through the savings they permit us to make by adjusting concepts and strategy to fully exploit them.

20. Against the above background we now note that the advocates of creating a conventional or dual capability in NATO forces in Europe do not also advocate that we spend the money necessary for reserve or stockpiles of modern aircraft, missiles and other equipment, or to develop the mobilization base, historically proved essential to sustain these forces in conventional combat. There seems to be, for instance, a tendency to assume that we can fight today's air order of battle in Europe with 90 to 100 percent of our total inventory of each type of modern aircraft in the front line, and this with no appreciable losses. Alternately, if plans do envision losses, they then assume that the limited conventional firepower of these ready air forces will be decisive in the very short period of time that they can hope to survive even under minimum attrition rate. The same seems to be true, not only of aircraft, but of many other weapon systems. We have replaced much of NATO's artillery with missiles such as Honest John, Hawk, and Nike etc, whose intricacy and cost clearly preclude production and delivery in terms of the rounds which would be required for a valid sustained conventional war effort, pending new production.

21. While modern aircraft and missiles have the capability to deliver conventional munitions, their use in this role, from a cost effectiveness point of view, leaves something to be desired. To risk a two-million dollar fighter on a mission with hard bombs, that experience tells us has little or no prospect of destroying even a small concrete bridge if accurately placed, is certainly the expensive way to accomplish the task. While one can argue, on a case by case basis, the desirability of risking, in a conventional role, equipment which was primarily designed and costed out for nuclear delivery, one cannot dispute the fact that to do this across the board and for any length of time, will guarantee economical if not military disaster, since at best results are incompatible with the cost of the effort.

22. In brief, if conventional operations are to be envisioned in NATO, NATO must be honest with itself and with the countries it represents, by insisting that these operations can be realistically carried out only if reserve and frontline forces and equipment of all types - not just supplies - are made available in quantities historically proven as essential to the effective and safe conduct of sustained conventional military operations. On the other hand, if, on further study, the evolution of technology is found to have led to cost considerations which make it impossible to meet minimum quantitative requirements to sustain conventional operations, then the acceptance by NATO of concepts that envision such possibilities merely for political or philosophical reasons, can only result in governments playing "brinkmanship" with a non-existent potential and, in disaster in the event of war.

Allied Solidarity versus possible Surrender of Territory

23. The primary mission of the NATO forces in Europe, in the event of war, is to prevent the overrunning and occupation of the territory of member nations in Europe. Allied forces in Europe have never been given the mission of defeating the USSR. The basic NATO concept remains that of the "Sword and Shield", which envisions that the forces in Europe (the Shield) will hold "as far to the east as possible" pending the outcome of the U.S. and U.K. strategic, atomic, air and missile offensive (the Sword).

24. In the early 1950's, it became clear to Allied planners that the "Shield" mission could not be accomplished to an acceptable degree without using atomic weapons from the onset of hostilities :

a. First, it was economically and politically impossible for NATO nations to match Soviet conventional "mass" along the entire NATO front. A successful forward defense, therefore, had to be based on weapons and concepts which did not depend on this.

b. Second, the need to arrest the enemy advance "as near to the frontier as possible" precluded the classical conventional defense strategy of mobile forces deployed in depth. The only prospect of preventing areas, such as West Germany, Northern Italy, and Denmark from becoming battlefields was to adopt a defense policy based upon both atomic interdiction and atomic counter land and air force strikes from the onset.

25. Any attempt at this late date to re-institute a non-nuclear defense capability in Western Europe will inevitably run counter to both the above requirements. Soviet superiority in conventional land and air forces in being, let alone in the ability to mobilize and deploy replacements would, under the most optimum conditions, force the Allies to fight a fluid, rear guard action on Allied soil. NATO forces in Central Europe would be quickly forced back to the Rhine, if not the Channel; losses would be worse in other areas, and major items of frontline equipment, for which there are no stockpiled replacements, would be quickly attrited to levels at which they could no longer implement atomic plans suffessfully.

26. Thus, a graduated conventional response strategy in the NATO area means at the very best trading NATO real estate for maneuvering room and time. The one thing that can be said for it is that it might allow rear areas, and remote nations, to avoid the ravages of atomic war if, in the time gained, they can "induce" the enemy to cease operations on the basis of accepting his initial gains, or withdrawing. At its worst, it means that the Allied atomic effort, when it has to be unleashed, will suffer from greatly reduced capabilities, and what there is of it will, to a large extent, be directed against targets in what was formally NATO territory.

27. Even if a conventional defense were adjudged as being capable of eventually arresting the Soviet advance into Western Europe, it must, by the very nature of the tactics involved, result in the initial loss of sizeable forward areas. Since sovereign governments are inherently required to provide "security" for their people, to include not only the protection of their freedom but also of their lives and property, any NATO concept or strategy, which at best offers some countries the prospect of being overrun, occupied and, subsequently, liberated has little appeal to the property owners and citizens in the areas concerned. Faced with this fact, their leaders can be expected, in due course, to question whether NATO was providing them with the "security" they bargained for when they joined the Alliance.

28. In summary, a NATO defense strategy based on the immediate interdiction and direct destruction of aggressive land and air formations with nuclear weapons, will no doubt result in sizeable incidental destruction in Europe. What seems more important, however, is that it would demonstrate conclusively the Allied will to go all the way to defend our rights, while at the same time probably stalemate the enemy advance "on or near the frontier". This strategy, therefore, offers some basis for the hope, on the part of exposed peoples, that the Soviet might be persuaded to negotiate when faced with the impossibility of successful local conquest, and at the same time a clear demonstration of Allied willingness to use atomic weapons.

29. Conversely, a NATO strategy based on a conventional graduated defense at the outset, would at best, result in the overrunning and subsequent liberation of exposed nations, and probably in eventual atomic attacks on their territory by their former Allies. As such, this strategy, while it might be rational for any one nation, is irrational for a coalition. A country, such as the United States, can plan to give up Texas, as a tactical maneuver, in order to better defend the U.S. A coalition, however, such as NATO, gives up the greater portion of one or more of its member nations' territory to better defend the remainder, and still expect those nations partially or wholly sacrificed to remain loyal to the coalition.

The "Will" to Resist by Conventional Means

30. Since the advent of strategic, and particularly atomic bombing, much has been said and written about ability to destroy a nation's "will to resist". Generally speaking, past estimates of the ability to do this, by bombing industry and urban areas, have been wrong. It seems likely that the degree of destruction of industry, cities, and non-combatants required to actually break a nation's "will to resist" is so high that the nation's "capability to resist" will normally be destroyed long before its "will".

31 There is another facet to the "will to resist", in war, about which less is said, and yet which should be given more consideration. This is where the "will" of the nation's military forces to continue the fight, or that of their political masters to direct that the fight be continued, is in question. Under these conditions, the loss of the "will to resist" does not stem from the physical destruction suffered,

but rather from a careful analysis of the best course of action to take in light of relative capabilities and of the interest of the parties concerned.

32. In 1939, resistance on the Continent ceased, notwithstanding the fact that the Allied nations involved had about 100 divisions in being, organized governments, and had suffered no paralyzing strategic attacks. Most historians would agree, therefore, that the collapse of defenses in Europe at that time resulted more from a realization of the uselessness of continued resistance, when faced with superior enemy forces on the one hand, and no evidence of any valid Allied support of consequence on the other, than from the direct effects of enemy actions.

33. The average enlightened soldier of this day and age, and more particularly their leaders, can calculate quickly the odds of success in any major military operation. They look at the relative strength of the enemy as evidenced by his firepower, air superiority, successful advances, etc.; they then assess their own strength, and if it appears clearly inferior, they look to see if there is anything on the horizon coming to their assistance. If and when the majority conclude that continued resistance has no prospect of ultimate success, will result in their defeat or capture, and will not prevent the overrunning of their families, property and country, but will only provide, at best, time for other countries and races to organize their defense, history suggests that they will fall back rather than fight or elect to negotiate with the enemy.

34. In those instances where military forces continued to fight under conditions which they recognized as hopeless, they represented only a part of a national effort, and as such their "last stand", while unable to achieve local defense objectives, clearly contributed to the ultimate success of their/nation or to the protection of their property and families. This is a very different situation from one wherein a "last stand" cannot contribute in any way to either the individual or national interest of those involved, but only to the protection of other peoples and nations. In brief, self-interest and national interest are historically valid motives for fighting in a losing situation, but only mercenaries continue to fight for the benefit of others when these motives no longer apply. Add to this the fact that there is no recorded case wherein forces fought against superior odds, and willingly faced certain defeat if not death, in order to protect the interests of Allies, while these latter withheld from the battle military capabilities that were they used might save them from this fate.

35. If history shows that the national and military "will to resist" can be broken in the case of enlightened forces who calculate that they are against hopeless odds, even though all possible is being done for them, by their Allies, it will certainly collapse immediately if the same situation occurs under circumstances where these forces, and their political and military masters, have full knowledge of the fact that their Allies are withholding forces or weapons which might otherwise save them if used. This will be true even though the reasons for withholding these weapons could be wholly rational to an individual not directly involved in the battle.

36. If the above conclusion is valid, it suggests that the Allied will to fight a conventional defense in NATO Europe and accept the consequences will only last as long as Allied operations are obviously successful; that losses sustained are minimal; and that little or no NATO territory is surrendered. Conversely, to assume that entire national contributions to Europe's defense will sacrifice themselves in battle, or that NATO governments will accept the overrunning of their territory and people solely to prevent the spread or war to other Allied nations, or the use of atomic weapons, is a very weak reed to stand upon.

37. In summary, no nation can properly be asked to fight to defend another, or a group of others, if and when the latter withhold forces and weapons that if used might effectively defend the territory of that nation. To plan on the assumption that non-European nations can persuade NATO to fight World War III, or any part of it, in Europe is to risk the dissolution of the Alliance. This, however, is the by-product, if not the intent, of a conventional, pause, strategy in NATO.

ECONOMIC IMPACT OF RISING MILITARY COST
ON NATO STRATEGY AND LONG RANGE PLANNING

THIS PAGE IS DECLASSIFIED IAW EO 13526

3rd Draft

ECONOMIC IMPACT OF RISING MILITARY COSTS ON NATO STRATEGY AND LONG RANGE PLANNING

1. In the US alone more than six billion is annually invested in Research and Development relating to defense. This investment produces a steady stream of new and improved weapon systems. When a new, or improved, weapon is invented the following pressures tend to encourage its acceptance into a nation's defense inventory:

- The normal military desire for the best and latest equipment.
- The sales pressure of industry, and need to keep industry healthy.
- The "If it exists, the USSR can have it, so must we" argument.

2. As a general rule each new generation of weapons are more sophisticated, and hence more costly, than their predecessors. This is logical since one has to pay something for the tremendous costs of research and development leading to the improvement in performance or in capability that the new weapons provide. A steady increase is also evident in the cost of military manpower, support facilities, and equipment. When the average cost of a nation's defense forces and weapons systems rises as a direct result of this, it is obvious that one of two things must occur:

- Either the quantity of forces and weapons purchased must be decreased proportionally, or

- The funds provided yearly to pay for these must be increased proportionally.

3. The rate of rise in cost of weapons and forces in the US alone, since World War II has far exceeded 4% per year - the maximum rate of rise forecast for the US GNP. A simil r ratio no doubt exist in all countries and in NATO over-all. As a result, a simple calculation will show that the rise in cost of defense establishments in the 1950's and 1960's could not and cannot be off-set, year after year, by equivalent increased in defense spending. If this solution was followed over the long term, the maintenance of a constant force level would result in costs exceeding the GNP of the nation or nations concerned, let alone their annual revenue. To validate this statement, one need only plot the rise in cost of fighter systems in NATO Europe versus the quantitative requirements established since World War II as minimums in NATO plans. In the case of US fighter costs versus NATO requirements, the numbers have remained constant while the item cost has gone up 1500% in 12 years. On the credit side, however, destructive capability has increased tremendously.

4. If the long term solution to the rise in cost of defense is not solely to increase defense spending commensurately, then it must be found, in part at least, by progressively decreasing

the quantity of forces and weapons required. Historically, nations have accommodated new and improved weapons by a combination of increasing defense funds to allow for their purchase, in keeping with the growth of their economy and their national wealth, and by concurrently decreasing the over-all quantity of weapons purchased, to offset that portion of the rise in cost that they were unable to meet by allocating more and more funds. The evolution of the US strategic bomber force is an excellent example of the case where each generation of delivery vehicles has been accompanied by both a rise in unit cost and decrease in over-all numbers of the vehicles deemed necessary to counter and defeat the enemy.

On Decreasing Quantity

5. In summary, the evolution of modern military technology results in a steady rise in average item costs of weapons systems and defense forces. Over the long term, this only partially can be offset by increases in national defense budgets. The difference therefore must be met by decreases in the quantity of forces, or weapons, required by the military. The quantity required for an effective defense at any time, however, is determined by two factors:

- Our defense commitments - "what we have to do"; and
- Our military concepts and tactics - "how we do what we have to do".

Reductions in the quantity of forces and weapons, necessitated by their rise in cost, therefore can be obtained in two ways:

THIS PAGE IS DECLASSIFIED IAW EO 13526

(1) by doing less, or (2) by doing the same things with less forces and equipment.

6. The military jobs to be done, our defense commitments, are quite independent of "how" we do them, or "what" we do them with. For example, an essential "job" or task could be to destroy a bridge. This could be done in many ways; with bombs, with missiles, with one atomic weapon, with a salvo of conventional bombs, or by capture and demolition. The fact that there are several alternate ways of accomplishing most defense tasks is important since it means that the quantity of forces and weapons required can, within sizeable limits, vary without changing the number of tasks or "jobs" that can be accomplished.

7. Past experience suggests that notwithstanding the above, reductions in weapons and forces are generally absorbed by arbitrarily reducing the number of "jobs" we undertake, or by increasing the risk factor in our ability to do the same number, and this in preference to changing the time honored methods of doing the "jobs". This tendency results from the fact that it is the easiest solution from a military point of view, as well as the solution that offers the best prospects of minimizing the reductions at the time. It is, however, the wrong solution, for if it is applied over the long term, nations find that the more sophisticated their weapons become the less over-all defense flexibility and capability they will have.

8. The correct way for NATO and nations to accommodate inevitable reductions in force and weapon quantities in their

THIS PAGE IS DECLASSIFIED IAW EO 13526

Long Range plans that envision the introduction of more advanced, hence more costly weapon systems, clearly is to make changes in their method of doing their defense jobs. - e.g. adjust and revise tactics, concepts, and strategies -- as necessary to fully exploit the new weapon systems and capabilities. This means substituting "quality" for "quantity", while keeping the defense "jobs" relatively constant, instead of reducing the number or scope of "jobs" to reduce the quantity of weapons required. There are two ways in which "quality" can be made to offset "quantity" while defense tasks are kept constant.

9. First, there is the direct - or simple - adjustment of quantity to quality, and to its bedmate, rising costs. This occurs when numbers of weapons systems are reduced in direct ratio to improvements in the capability of new systems of like types that are adopted. If a new gun, or fighter aircraft, has twice the firepower of its predecessor, theoretically we can replace two old ones with one new one and do the same job in the same old way, but with less equipment and frequently less forces. Unfortunately, there are limits to the extent that the direct adjustment can be used of offset rising defense costs. Sometimes, the nature of the new weapon does not permit a direct comparison as is the case between aircraft and missiles. The former can be turned around and used against multiple targets, whereas the latter is a one shot, one mission weapon. Other factors such as dispersion, range, vulnerability, deployment, etc, will also limit severely the extent to which quantity can

THIS PAGE IS DECLASSIFIED IAW EO 13526

can be reduced regardless of improvements in weapon performance.

10. The second, and ultimately inevitable, method of reducing force and weapon "quantity" to offset defense cost increases, involves finding new ways to do the old "jobs" with less forces and equipment. This solution is by far the most complex and difficult to come by because it requires that the military devise new concepts, tactics, and strategies around the new weapon and force capabilities produced by technology. While changes in military hardware are sought and welcomed, changes in how the hardware is used, particularly when they result in reductions in force equipments, have historically been resisted. Both parochial military and political pressures oppose the full exploitation of new weapons, such as space systems and atomic munitions, in war. Since this opposition does not extend to their invention and development, however, it serves only to frustrate the logical evolution of defense costs and defense concepts, and it results historically in the inevitable adjustments to concepts taking place as a result of agonizing reappraisals rather than as a result of normal evolution. The New Look of 1953/54 in NATO is an example of this.

Some Conclusions

11. Nations, and particularly their military establishments, must evolve defense concepts which accept and exploit the weapon capabilities given to them by their technological discoveries. Due to a human tendency to welcome and seek new weapons

0869

and technological progress, while resisting change in ideas and concepts, the evolution of the latter does not follow rapidly and smoothly from the former. This causes today's recurring defense budget crises, and confusion over defense strategy. It means that the side most competent in steadily adjusting its concepts to its new weapons, as necessary to optimize cost and capability, should ultimately win.

12. The above relationships are primarily of concern to long range defense planning. Years often pass between the invention of a new weapons system, or other capability, and the evolution of concepts and defense policies that accept and exploit it. Old, tired, and reactionary concepts are perpetuated or reinstituted in peacetime by every conceivable device before they are rejected. Sooner or later, however, economic, political, or national security considerations override historical resistance to change, and the old gives way to the new. Thus the first basic law for long range planning is:

"National Defense Concepts and policies must be evolved towards the full exploitations of the products of technology over the long term."

13. A second law of long range planning that follows from the first law is:

National power at any time will vary directly with the extent to which that nation's defense concepts and policies rely on and exploit fully the latest military technology.

14. A nation which fails to exploit fully the latest in military weapons risks that its adversary will do so and thereby gain a decisive advantage. Likewise, a nation that tries to exploit the latest weapon systems, but only in addition to maintaining older techniques and capabilities - when its opponent does not - invites economic crises and spreads its financial and manpower resources over too many areas to the detriment of all. When the opponent makes the same error, this last error maintains the power equilibrium. This has been the normal situation in recent years as between NATO and the Soviet bloc.

Impact of Conclusions on Current NATO Trends

15. Some recent editorials and speeches indicate a need to change in a direction opposite to that dictated by the above laws of sound long range security planning. The prevalent idea seems to be to build up conventional mass, reduce reliance on the outstanding products of technology -- atomics, space systems, etc -- while maintaining Allied technological developments, capabilities and superiority in these fields.

16. The cost-concept equation is being balanced this year by providing additional quantities of classical weapons and forces at the expense of a major one time increases in US defense spending. Meanwhile, the item cost factor rises with each new development. If the laws in para 12 and 13 above are correct, this trend will have to be reappraised at an early date.

If not, the resulting multiplication cannot but cause such a snow-balling of resource demands as to force on NATO the following choices, or a combination thereof, within the next 2 or 3 years:

a. To accept a reduction in commitments - the amount of forward NATO terriroty we can effectively defend.

b. To accept to fall behind in new capabilities - have less modern weapons than the Soviets as is now the case with Soviet MRBMs vs NATO aircraft.

c. To increase taxes and/or deficit financing to the point of economic self-destruction - at a greater rate than the growth of the GNP, or,

d. To review the current trends in NATO strategy and readjust both concepts and forces to fully exploit all new weapons and munitions and abandon the old ones.

17. The proper course of action is clearly the last, d above. Only by reaping the benefits of full acceptance of atomic weapons can we meet NATO defense commitments over the long term and within acceptable resource levels. Later, on both a global and national scale, strategic force and vehicle levels may have to give way to lesser, more powerful, space forces able to accomplish the strategic task in new ways and with new concepts.

18. The most likely, and dangerous course of action and probably the one that will be attempted by NATO unless the real problem is understood - is a combination of a and b above.

This will lead to increasing conflict, and confusion over NATO defense during the next few years and until a new agonizing reappraisal, like the New Look of the 1950's forces the defense equation back into balance.

THIS PAGE IS DECLASSIFIED IAW EO 13526

VIEWS ON THE PAUSE CONCEPT

THIS PAGE IS DECLASSIFIED IAW EO 13526

Some Views on The Pause Concept

The NATO strategy envisioned in the 1956 political directive, and in MC-48, MC-70, and MC-96 depends on responding to all acts of Soviet aggression- other than incursions and minor acts of aggression- by an all out defense in ACE using atomic weapons from the onset.

This strategy has in recent years been criticized on the grounds that it provides little or no opportunity to arrest hostilities, by negotiation, before general war ensues, even though they were to develop initially under circumstances wherein the Soviet neither intended nor desired general war.

In an effort to meet the above criticism SACEUR has advocated a defense policy, and strategy, which would provide; not only limited conventional response to incursions and minor aggressions, but in addition a NATO effort to arrest briefly the enemy advance on or near the frontier, by conventional means if possible, thereby forcing a "pause" during which both sides could contemplate and discuss the consequences of continuing the war.

The "pause" concept has been controversial in both military and political circles due primarily to the following considerations:

a. the extent of allied territory that would probably have to be traded in an attempt to create a "pause" of useful duration.

b. the likelihood that any delay in NATO's atomic response would degrade Allied capabilities by allowing the Soviets to seize the atomic initiative, or even destroy by conventional air attack SACEUR's atomic retaliatory forces.

c. The size, cost and general incompatibility of forces required to obtain a "pause" of useful duration without using atomic weapons, as compared to forces that can defend NATO territory effectively using atomic weapons from the onset.

d. the surrender to the Soviet of "control over escalation" which is inherent in any concept that admits they will be given an opportunity to "consider the consequences of their act of aggression, and disengage in light of the risks involved." This minimizes the risks in Soviet political bluffs and in attempts at minor aggressions, thereby inviting both of these.

The "Pause" concept was not developed for use in connection with retaining Berlin access by forceful means. It should not therefore be confused with Allied strategy in the event access to Berlin were denied by force since the latter involves allied advances into enemy territory rather than enemy advances into NATO territory. In the Berlin case, where the Allied military response is of necessity offensive rather than defensive the problem of controlling escalation by graduated use of force is different in that considerations a and b above do not apply.

A general analysis of the various views and statements on the "Pause" concept- and particularly on the worth, scope, and duration of a "Pause" - suggest that proponents and opponents can be grouped, by their views roughly as follows:

SACEUR's Views:

SACEUR considers that the force levels called for in his requirements plan may allow him to create a "pause" if and where the circumstances permit. This would only be attempted if it can be accomplished with little or no loss of Allied territory, and the resulting "pause" could well be of short durations- hours or a few days at most. Nevertheless, the possibilities of averting general war warrant accepting some risks of loss of nuclear initiative, and surrender of control over escalation attendant on this concept. Existing NATO directives need not be revised to permit attempts to achieve a "pause" of this type.

Opponents Views

Opponents of the concept consider no useful "pause" can be achieved without a major increase in conventional forces; that such an increase is economically and politically impractical, and will become more and more incompatible with the maintenance of an effective capability to survive and respond to atomic attack. The resulting cost, gamble on enemy intentions- e.g. that he won't initially strike our conventional concentrations with atomic weapons-- and the likelihood that the concept would result in our loss of the atomic initiative and/or of sizeable allied areas to no avail, plus the invitation to political if not limited military aggression inherent in it, more than offset the advantages of seeking to create a "pause" if and when the ACE is faced with aggression greater than incursions but short of general war.

Proponents of Change in NATO Strategy

Those who would change NATO strategy to one that relied on a major conventional graduated defense (super pause) consider the US advantage in strategic nuclear capabilities to be so great that the Soviets will back down, and disengage, if given the opportunity while being faced with gradually increasing NATO resistance. To permit this, and prevent explosive escalation, or other situations where the Soviet can no longer "back down", they believe it is worthwhile to sacrifice sizeable allied areas, and possibly ACE force capabilities-- particularly since the latter account for a very small percent of the over-all nuclear effort in a general war hence this loss, in seeking to avert such a war, would be of little consequence to the outcome for the whole. They advocate as long a period of conventional defense as possible, and accept all the consequences including loss of forward areas, surrender of the initiative, and surrender of control over escalation, in the hope the Soviet can be persuaded to disengage before the war extends beyond purpose. Advocates of this view seek to change basic NATO directives to force SACEUR to plan only on this response.

Currently Approved NATO Policy

Current NATO strategy in response to aggression has never taken formal cognizance of the "pause" concept. It calls for a defense of the NATO area as far to the East as possible using nuclear weapons as necessary from the onset. No sacrifice of territory or defense force capability- stated or implied, has heretofore been acceptable in return for time in which to negotiate a cease fire once hostilities have begun. The Berlin Contingency Planning directive, does, however, recognize the concept of graduated offensive application of force, but this is discussed separately, and relates to the offensive use of force to seek a re-opening of access to Berlin and not to a defensive action to oppose a Soviet advance into Europe.

EMPLOYMENT OF AEROSPACE SYSTEMS IN THE COUNTERMILITARY ROLE

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

13 7 (see 18)

ON THE EMPLOYMENT OF AEROSPACE SYSTEMS

IN THE

COUNTERMILITARY ROLE

PURPOSE

1. Two theories of war pervade thinking on national security affairs today. They are incompatible and thus form the basis for major differences of opinion on which direction defense planning should take. An understanding of these differences is essential to an understanding of military affairs today, and the effect of such planning on future force structure and strategy. It is the purpose of this paper to discuss two strategies in which aerospace forces, in particular, may be employed.

1st Theory -- A Return to Small Wars

2. One theory holds that neither the United States nor the USSR will begin an all-out nuclear war if the respective nuclear deterrent forces are invulnerable to surprise or pre-emptive attack. The attacker's costs in terms of losses from the second-strike retaliatory forces are too high in terms of population and treasure. Both sides would, in effect, commit suicide.

3. Beginning from this premise, a case is then made for creating larger limited war forces with improved conventional armaments. The reasoning goes: while general war is too costly and will therefore not happen, limited wars automatically become more likely. For now the USSR will realize that it can nibble away at the edges of the Free World behind the shield of its own deterrent machinery. (At present, the U.S. is not "mutually" deterred, but limited war is more likely only because conquest by general war has been made impossible.)

4. To meet this threat, this theory holds, we build large limited war forces -- big enough to handle a Korea or even another World War II -- and defray a substantial portion of the added cost from money saved by cutting down on strategic war-fighting systems.

5. This can be done because the United States no longer need prepare to win a general war; it need prepare only to deter it. And an effective deterrent force, the argument continues, can be achieved by possessing the ability to inflict on Russia an "unacceptable level of damage." This calls for a much smaller "strategic" capability (either a "minimum" deterrent based on terror weapons or the more credible "finite" deterrent tied to known, fixed, military and civil targets) than the United States now has, and funds for limited war forces could come from the surfeit of funds that would thus become available. Further, the stability of the strategic balance can be assured by a mutual recognition of the "impossible" nature of modern nuclear warfare.

2nd Theory -- Counterforce as a Concept

6. The second school of thought, supported by a substantial segment of Air Force officers, among others, questions the "stable" or "finite" deterrence concept. It believes such a deterrent threat would not be credible to the Russians in the event of Soviet large-scale aggression against an ally. The price for using it would be to suffer equal or greater damage from the Soviet retaliatory forces. Stable deterrence would put the United States in this position by providing military strength sufficient only to hurt an enemy by destroying known targets, while leaving mobile, very hard, or unplotted weapons untouched and largely free to destroy the United States.

7. Supporters of the counterforce concept believe that the Sino-Soviet Bloc understands only one thing: mass force. Consequently, there can be nothing subtle about deterrence; instead, the Free World must confront the Soviets with incontestably superior military power.

8. This second group believes that effective deterrence is achieved only when the United States has the ability to wage and win a general war if such a war should occur. They believe that power that cannot prevail will not deter. Believing that deterrence is a by-product of a war-winning capability, this group thinks the United States must be prepared to fight and win a general war as well as lesser aggressions.

THIS PAGE IS DECLASSIFIED IAW EO 13526

Counterforce Concept Defined

9. To many people, it seems impossible that one side could win a thermonuclear war, given the power and destructiveness of modern nuclear weapons. Certainly there could be situations in which neither side won; national passion soars to great heights in wartime. There could, however, also be situations where one side emerged with a clear-cut victory, and its remaining military capabilities far surpassing those of its opponents. The key lies in successful offensive/defensive action to deny the enemy access for assessment of his effort, and in providing friendly forces with a capability to reconnoiter, recycle, and reattack.

10. Victory in general war is achieved when the enemy's military forces have been destroyed, captured or neutralized, and there remain adequate friendly military, political and economic capabilities to permit the victors to control the international situation. To build such a war-winning capability, the United States must adhere to a military strategy aimed at destroying the enemy's military forces rather than his country or population. This is what is meant by "counterforce" concept and a "counter-military" strategy -- using military forces to selectively and decisively destroy or neutralize enemy military forces that could otherwise defeat or coerce us with threats of total destruction.

11. The requirements for a war-winning capability go beyond pure military considerations, however. In addition to having forces for a counter-military strategy, the United States must have aggressive civil defense and post-attack reconstitution and recovery programs.

12. The civil defense program must provide maximum protection for the population. The post-attack reconstitution and recovery program must provide for the reconstitution of political control and military forces to provide surveillance over the defeated enemy's territory and airspace, to put down insurrection or revolt, and guard the armistice. Measures are also necessary to expedite economic recovery. These measures, rather than being provocative, are common-sense precautions against a final Russian perfidy.

Countermilitary Operations Are the Practical Application of Counterforce Theory

13. In broad historical terms, there is nothing new in the counterforce concept. As a matter of fact, it was a traditional military concept until the 20th Century. The two World Wars, however, added a new prerequisite to victory -- the destruction of the enemy's war-making capabilities.

14. The military technology of that time was such that the decisive phase of war came after two to three years of hostilities, when the production lines began to turn out weapons for use by massive ground armies recalled from the national reserve. Because of the central importance of war production, certain pivotal industries, e.g., fuel and transportation centers, had to be attacked. Destruction of these facilities destroyed the capability of armies and impressed on the populace the futility of continued resistance.

15. Nuclear weapons and aerospace forces have erased the validity of mobilization war concepts in general war. These two instruments of war, joined together, have forced the decision point of war to come at the beginning of hostilities. Consequently, the required war-winning capability must be extracted from the industrial base prior to the initiation of hostilities. The decisive force thus created must concentrate on immediately destroying the offensive and defensive strengths of the enemy.

The Nature of Access to Targets

16. In either general or limited war, the most essential military element to be destroyed or neutralized is the enemy's aerospace forces. Once these have been defeated, access is gained to all other military assets, including assets with a nuclear capability. With this access, the threat to destroy the enemy's remaining forces and other pressures become entirely credible and lead to the attainment of those political objectives for which the war was fought.

What a Countermilitary Capability Requires

17. To implement a countermilitary strategy demands a well-integrated national military structure. It requires, first of all, strategic offensive forces to destroy enemy strategic strike forces at their source. Next, strategic defensive forces in depth are needed to destroy enemy

THIS PAGE IS DECLASSIFIED IAW EO 13526

strategic weapons in-flight, as far from the United States as possible, but as close-in as necessary. Thirdly, we need military forces to conduct a holding action in conjunction with our allies, to prevent the overrun of friendly territory. And, finally, there must be accurate information on the status and location of the enemy's remaining and holdback forces. With these ingredients, the United States will be able to use its military power with discretion in general war just as it plans to do in limited wars.

18. These ingredients must be carefully tailored to their missions, and always with the requirements of an integrated general war strategy as the primary consideration. Offensive and defensive weapons must always be in position and ready to strike with precision and accuracy in all kinds of weather. There is no place in any military strategy for weapons which promise only the inevitable destruction of enemy cities except in the bargaining role, or to offset the blackmail threat of terror weapons. Instead, all forces must be geared to destroying those enemy forces that directly threaten the military superiority of the United States during the decisive period of the conflict.

Feasibility of Countermilitary Operations

19. The difficulties of executing a countermilitary strategy today vary with the conditions prevailing at the time U.S. forces are launched.

20. If our forces are launched after a surprise attack by the USSR, their capabilities to carry out countermilitary tasks will be handicapped but not eliminated. At the minimum, those forces on airborne alert will be able to strike enemy targets, and U.S. air defense aircraft and missiles will degrade seriously the attacking forces as an essential contribution to the total countermilitary effort. In addition, the general complexity of mounting a surprise attack of such magnitude without giving at least tactical warning, virtually guarantees a remaining force of considerable strength, especially considering the superiority of U.S. forces initially.

21. Regardless of the conditions under which hostilities may begin, a countermilitary strategy, more than any other, will minimize the enemy's ability to inflict damage on the United States and should greatly improve the credibility aspect of employing strategic forces to succor an ally.

The Missile's Role

22. The increasing role of missiles, satellites, and other related aerospace systems has no effect on the validity of the concept. As missiles complement the other weapons of major powers, however, the problems of identifying and striking enemy strategic forces will change. To successfully attack such forces will not be an easy task; and in large part, its difficulty has led to the stable deterrence concept.

23. Critics argue that since implementation of the counterforce concept requires destroying all enemy strategic capabilities early in the war, that it is not an acceptable strategy when the United States responds to a Soviet attack. In such a situation, they contend, the United States would not know which targets to strike and it would not be militarily sound to hit all missile sites after some missiles have been fired. Also, such caveats neglect the real military requirement of withholding reserve and "bargaining" forces.

24. Sound logic demands that the United States strike all enemy missile sites as well as all air bases and their support and control structures. Unless its military forces plan to go after these targets, the United States cannot launch a strategic blow against the Sino-Soviet Bloc to come to the aid of an ally. It cannot strike because it cannot hope to win. Even in a situation where the United States responds to a Soviet attack, the United States must hit all eligible military targets.

Cost of Striking Hard Sites and "Empty Holes"

25. The argument most often raised against striking missile sites is basically an economic one. It is said it is too "costly" to hit missile sites after some of the missiles may have been launched. This argument, however, does not consider the correct costs. The costs to consider are those of not striking missile sites which house missiles that could be used to defeat the United States. In other words, in terms of U.S. survival potential, it is much more costly not to strike all known missile sites as well as all sites identified during the course of the conflict. If deterrence should fail, if the Soviet concluded that he could win the global prize in a general war, he might attack. He has improved warheads and the missiles to carry them. But, if the Soviets do attack

the United States, not all their missiles will be launched on the initial strike. Intent on winning war while minimizing damage to the USSR, they will have to concentrate initially on military targets. They will retain a sizeable reserve force after the initial attack to continue to threaten U.S. industrial and urban areas; to strike additional lower priority targets or high priority targets attacked but not destroyed in the initial attack; to retain a reserve to meet other possible threats from third parties; and to negotiate with or to blackmail. These missiles will be at their launch sites when the United States strikes back. In addition, because of malfunctions, unready missiles and aircraft, failures in command and control, and reloading and recycling operations, still other vehicles will be in place.

26. All these factors might result in as high as 25-30%, or more, of the missiles being on site when the United States strikes back. The United States must have the means to destroy these targets.

<u>Summary</u>

27. In summary, the Air Force recognizes that deterrence is man-made, a situation the United States has created by maintaining superior military forces in-being. If the United States does not maintain recognizable war-winning forces, the Sino-Soviet Bloc will realize that, by threatening to raise the level of any limited military conflict to a higher scale, it can bend the United States and the Free World to its will.

28. For these reasons, the Air Forces believes that a countermilitary strategy is a fundamental precept of the national policy of deterrence, and is the most essential ingredient of a U.S. war-winning capability.

29. Countermilitary operations are feasible, under conditions of a USSR surprise attack on the United States, a U.S. response to an attack on an ally, or a U.S. response to certain knowledge of an impending attack on the United States.

30. Without military capabilities based on a countermilitary strategy the United States cannot carry out its commitments to the Free World, it denies itself flexibility of decision in extremely provocative situations, and it subjects itself to possible nuclear blackmail by the Sino-Soviet Bloc.

31. With countermilitary capabilities, the United States has the means to defeat the enemy's military forces, and by so doing, to deter general war, or to prevail should it occur. Furthermore, a countermilitary capability which can be applied successfully across the entire spectrum of conflict tends to suppress further and further the level of open or covert violence open to the aggressor. It enables conflict to be resolved at ever lower levels, and may eventually cause the Soviet to abandon military or covert force altogether.

32. A countermilitary strategy, more than any alternative strategy, makes use of technological improvement. As accuracy increases, yields can be substantially reduced; not only are fewer weapons required, but also collateral damage to non-military complexes is limited. There are substantive gains in feasibility (certainty of target neutralization and Russian assessment of the strike as countermilitary or counternational); in cost (for fewer vehicles and warheads are required); and in casualties (it is as much in the Russian interest to exercise restraint as ours). Thus, a countermilitary strategy capitalizes on advancements in many areas, including space capabilities, and provides a means to insure the continued credibility of force as an instrument of national policy.

THIS PAGE IS UNCALSSIFIED

6 July 1967

Maj. Gen. Edmund C. Langmead, USAF (Ret)
1244 No. Grandview Ave.
Daytona Beach, Fla. 32018

Dear General Langmead

This will acknowledge receipt of your typed report on the AEAF and of three large envelopes of exhibits which accompanied it.

We are most grateful to you for this gift to the USAF Historical Archives. It is a significant and useful addition to the history of AAF activities in World War II. All of your papers will be kept together in what will be designated as the General Langmead Collection.

A similar report on the First Tactical Air Force will be of real value in our files.

You will be interested to know that in September we begin work on a history of the Eighth Air Force in World War II. It is a two-year project; we expect to publish it as a book when it is finished. I am sure that your reports and papers will be of value to the man who will write that history.

Sincerely

ALBERT F. SIMPSON
Chief, USAF Historical Division

Copy to: ASHAF-A

THE ALLIED EXPEDITIONARY AIR FORCE

I-INTRODUCTION

The concept of an Allied Expeditionary Air Force organization for operational control of the Allied Air Forces, during the assault on the German positions on the French coast, was accepted by the heads of state (of the USA and Great Britain) during the Quadrant Conference at Quebec in August 1943. It is therefore necessary to begin the story of the Allied Expeditionary Air Force (AEAF) with an understanding of the position taken, during the conference, by the President of the United States, and the compromise which was accepted by the Prime Minister of Great Britain.

My memory of what happened (and when) has been refreshed by some interesting exhibits and by relevant extracts from V-Mail and Air Mail letters written by me to my family. These items are listed, in chronological sequence, in Appendix A. The "relevant extracts" are quoted in Appendix B.

Several of the most interesting paragraphs of the narrative are not supported by "relevant extracts" as they were, at the time, of BIGOT classification. These items are supported solely by my memory.

About half of the "relevant extracts" are not specifically referred to in the narrative. These items are listed in Appendix A and included in Appendix B in order to provide to the reader of this report, a "contemporary thought" frame of reference.

THIS PAGE IS DECLASSIFIED IAW EO 13526

TH

II-THE QUADRANT CONFERENCE, QUEBEC P.Q.-AUGUST 1943

2. When the U.S. Army Air Force staff group was ordered to proceed to Quebec, P.Q. for the Quadrant Conference (August 1943), the chief items reserved for decision at the Heads of State level were:

a) The site for the proposed landing on the Continent.
b) The date for launching the assault on the hostile shore.
c) The top command structure.

Substantial agreement had been reached, on the lesser details of the venture, by the combined chiefs of staff (U.S. and U.K.) sitting in Washington, D.C. (Ref. EX 1, EX 2, A 1, A 2)

3. Prior to the convening of the Quadrant Conference the Combined Chiefs of Staff and the U.S. Joint Chiefs of Staff had done an outstanding job of appraising the military problem which presented. They had defined the size and composition of the forces required to make the landing, and the build-up of forces required for the defeat of the Axis Powers, through cooperation with the Russian Forces. The Combined Chiefs of Staff had developed recommendations with respect to those items (see paragraph 2 above) which were reserved for decision by the Heads of State (President of the United States and Prime Minister of Great Britain).

4. The writer of this report was never a member of the staff of the Combined Chiefs of Staff nor of the Joint Chiefs of Staff (U.S.). He was, prior to the Quadrant Conference (Aug. 1943), concerned primarily with the allocation of munitions to meet military requirements, as presented by the U.S.A., United Kingdom, Russia, Brazil, and our other allies, in support of the operational plans approved by the Combined Chiefs of Staff. This function was assigned to the Munitions Assignment Board - Mr. Harry Hopkins, Chairman. (Ref. EX 3).

5. The lower tier staff officers, who were assigned to duty at the Quadrant Conference, left Washington without any limitations on expression of personal opinion. Shortly, after arrival in Quebec, the lower tier staff received "the Word" that, under no circumstance, would any U.S. staff officer accept any assumption with respect to the nationality of the Supreme Commander, Allied Forces in Europe. That subject was reserved for discussion and decision at the level of the Heads of State. At that time the British staff position was that, since the invasion was to be launched from England, it was logical to assume that the Supreme Commander would be a British officer.

6. The President of the United States and the British Prime Minister reached agreement, without benefit of advice from the lower staff tiers, on the following arrangement:

a) The Supreme Allied Commander would be designated by the President of the United States.
b) The Commander, Allied Naval Forces for "Operation Overlord" would be designated by the Prime Minister of Britain.

THIS PAGE IS DECLASSIFIED IAW EO 13526

TF

c) The Commander, Allied Expeditionary Air Forces, would be designated by the Prime Minister.
d) During the assault phase of the landing operation the Supreme Allied Commander would exercise command control over the Allied Ground Forces.
e) When the beach head had been secured, and the number of U.S. troops ashore, on French soil, exceeded the number of British, Canadian, and Anzac troops, the Supreme Commander could establish two Army Commands, one with a U.S. Commander and one with a British commander.
f) The Strategic Air Forces (USAAF & RAF) would support the ground forces as long as necessary to insure Allied control of the area required for the deployment of the troops committed to "Operation Overlord". When that task was accomplished, the Strategic Air Forces would resume, under the direction of the combined Chiefs of Staff (U.S. and British), their primary task of reducing the German capability for supporting the German Field Forces engaged in battle.

III-THE ALLIED EXPEDITIONARY AIR FORCE

7. The writer of this report returned to Washington about 23 Aug. 1943, and shortly thereafter received orders to report to Headquarters, European Theatre of Operation (ETOUSA) in Norfolk House, St. James Square, London, England. The flight, by MATS DC-4, was made from Washington, D.C. to Prestwick, Scotland on 26, 27, 28 September 1943. The Air Section of the ETOUSA staff consisted chiefly of Col. Haywood "Possum" Hansell and Col. Phillip "Pete" Melville. Office space was in short supply.

8. By 7 Oct. '43, the Air Commander-in-Chief of the Allied Expeditionary Air Force had been designated - Air Chief Marshal Sir Trafford Leigh-Mallory. Decision had been made to establish his headquarters at Bentley Priory, Stanmore, Middlesex. This had been RAF Fighter Command Headquarters, and was well equipped with an underground Command Post and excellent communications to all RAF headquarters in England. (A 3)

Note: Bentley Priory is 12 miles N.W. of Picadilly Circus, London. St. James Square is 220 yards S.W. of the same reference point.

9. Maj. Gen. Bruce Butler (USAAF) was designated as Deputy Air Commander-in-Chief of the Allied Expeditionary Air Forces. His efforts were doomed to be frustrated by the hostile attitude of the U.S. Ninth Air Force, and of the lower staff tiers at Headquarters, U.S. A.A.F.-Europe (USAAFE). Gen. Brereton had arrived in mid-October from the MED (Mediterranean Theatre,) to take over command of the 9th AF (U.S.), bringing with him "a team". It is doubtful whether these people were ever appraised of the reason for existence of the AEAF, or that a British commander therefor, had been accepted by the President of the United States. (V 1)

10. The lower staff tiers at Hdqts. USAAFE were hostile to the concept of a combined Allied Expeditionary Air Force with a British commander. The senior officers of the AEAF were naturally reluctant to refer routine problems of manning or supply to General Spatz or to General Knerr. USAAFE lower staff tiers did, in several cases, take action with apparent malicious intent. One case was that of USAAFE filling an AEAF requisition for two non-rated Captains, with two individuals from the Stone Port of Debarkation (Liverpool), where they had been consigned, as undesirable persons for return to the Zone of the Interior. Another case was the flat refusal to respond to an AEAF request for a report on the numbers of airplanes with the 9th A.F. (U.S.) in England - serviceable and unserviceable. (A-10)

11. By mid-December 1943, the U.S. component of the staff for the Air Commander-in-Chief, Allied Expeditionary Air Force, was manned (numberwise) with 72 U.S. Officers (Adj. Gen., Medical, Signal, Ordnance, Chemical, Quartermaster, and Air Force). Our experience level was relatively low, compared with 8th A.F., 9th A.F. and USAAFE. Morale of the U.S. staff component of AEAF was generally low, and the rate of personnel turnover was high. Constant friction with the "first team" personnel at USAAFE (Widewing) and 9th AF (Ascot) resulted in continuing frustration for U.S. members of the AEAF staff. (V3)

12. General Eisenhower was announced as the Supreme Allied Commander on 25 December 1943. Maj. Gen. Bruce Butler of AEAF, was acquainted with Gen. Eisenhower. They had been students together at the U.S. Military Academy and had played on the same football team (opposite tackles). When Gen. Eisenhower held his "assumption of command" ceremony (at Norfolk House, St. James Square, London) the only space available was one small room from which the furniture had been hastily removed. The General spoke very briefly to his standing audience, and then shook hands with the 30 or 40 Allied Forces command and staff personnel who had been hastily summoned for the function. (EX 4, V 6)

13. By the end of January 1944 the U.S. Component of Headquarters, Allied Expeditionary Air Force was operational. We were sending out request for information on our own letterhead stationary as AEAF staff members, rather than as part-time members of the Air Section of Hdqts. ETOUSA. At first it seemed that our inability to satisfy the AEAF Air Commander-in-Chief's requests for information may have been caused by poor staff procedures and by inexperienced staff personnel. By the end of the month of February it became evident that the cause of our trouble was not entirely that of the AEAF Staff (A 15, V 8).

14. During early March 1943 the Hdqts. organization of the Ninth AF (U.S.) was augmented by a contingent of experienced senior USAAF officers, some from the MED and some from the ZI. They included M.G. Ralph Royce, B.G. Fred Borum, Col. Bernard Tooher, and Col. Harold McGinnis. The U.S. component of the AEAF staff could not compete, on a rank or experience basis, with the staff of the 9th Air Force. (V 9)

15. In December 1943 the Air Section-ETOUSA had reviewed the problems of command control for the Tactical Air Forces (a) supporting the invasion, (b) supporting the establishment of a port area, (c) supporting the breakout, (d) supporting the pursuit. The 8th Air Force (U.S.) and the RAF Bomber Command were not involved in the study. Decision was made to defer completion of the study pending designation of the Supreme Allied Commander. Gen. Eisenhower's subsequent decision to abide by the Quadrant Conference agreements during the assault phase was most logical, but it was not accepted in good grace, by the dissident U.S. factions.

16. During late March 1943 M.G. Bruce Butler was relieved as Deputy Air Commander-in-Chief, Allied Expeditionary Air Force. The writer of this report did not probe for Gen. Butler's appraisal of the reasons for his relief. He simply announced that the Air Chief Marshal did not have confidence in him. He was, I believe, the victim of a massive opposition to the concept of an Allied Air Force Command. The opposition was mounted, for selfish reasons, by USAAF officers of other commands. (V 10, A 16)

17. Maj. Gen. Hoyt Vandenberg arrived in the London area in mid-March 1944, and engaged in extended discussions elsewhere before appearing in the AEAF Command Post at Bentley Priory, Stanmore, Middlesex (London suburb). He subsequently brought in several new top staff members and released several of Gen. Butler's staff officers; Col. Aubry Strickland (Ops)., Col. Earl DeFord (Ops), and Col. A.W. Marriner (Signals). (V11, V12, V14, A18)

HIS

18. Shortly after Gen. Vandenberg took over his duties as Deputy Air Commander-in-Chief AEAF, a substantial case of unreasonable refusal, by a USAAF organization, to respond to an AEAF request for information, came to my attention. I reported the case to Gen. Vandenberg. His response to me was brief -"Eddie, let me handle this." No further discussion was had between us, on this incident or any subsequent incident. I deduced, from his response to me, that he was aware of the clash of opinion in the upper command levels, and that he had, from the President and Gen. Arnold, instructions as to his course of action.

19. A tightening of censorship regulations about 1 May '44 accounts for the fact that my correspondence during May and June 1944 consisted mostly of bland references to family problems. My 29 April '44 V-mail letter includes this sentence: "The censor extracted and returned to us, for our information, a lot of remarks recently made by members of this Headquarters. I was pleased to learn that none of mine were included." I therefore have, for the months of May (1944) and the first two weeks of June, few memory stimulae to focus my mind on the AEAF routine problems of that interval.

20. By late April, or early May 1944, General Eisenhower had slightly modified the assault plan for Operation Overlord, as approved by the Heads of State during the Quadrant Conference (Quebec) in August 1943. His modification provided for a landing area (UTAH) to the west of the Carenton Estuary. The purpose of this modification was to accelerate the seizure of the Port of Cherbourg by U.S. troops moving up from the south. This slight change in the assault phase operation had no substantial effect on the Air Force plans for supporting the assault. The reason for the modification was that the terrain of the Carenton-St. Lo-Isigny triangle (south of the Carenton Estuary) was mostly marshland with a poor road net and weak bridges. It would have presented a major obstacle to the movement of armored vehicles westward out of the OMAHA landing area for attack upon the land side defenses of Cherbourg.

21. In late May 1943 there was held, in the Auditorium of St. Pauls School (London) the most impressive "Pre-Game Pep Rally" which the writer has ever attended. On the floor of the stage was painted a large scale map of the French coastal area from the mouth of the Seine to the west coast of the Cherbourg Peninsula. Each of the major Allied Force commanders addressed the assembled subordinate commanders and their senior staff officers. The audience sat in the balcony, looking down on the map of the French Coast. Delivery styles of the speakers varied. General Spaatz stood at the podium and read his speech without enthusiasm. Gen. Montgomery and Gen. James Lawton Collins used the map very effectively, and recited like actors in a play. Each had a confidence, in himself and his Army, that was very inspiring. Toward the end of the session the King of England took his place at the podium and spoke briefly. The U.S. listeners almost choked to death trying to help him get his words past his tongue. When His Majesty had finished his speech a prompter had to poke a little round man, who was obviously asleep, sitting in the middle of the speakers row (facing the stage). He shook himself, raised his chin off his chest, looked around and then casually strolled up the steps to the stage and walked over to the podium. His first few sentences came out as though from a man who had been asleep. Very shortly his words started to flow steadily and then the pace of his speaking increased. Never before had the writer of this report heard a more convincing and inspiring statement of intention of and capability for taking to the field and "winning a game". When Winston Churchill finished his speech he had fired his audience with a spirit that stayed with the Allied Forces through all the dark moments of "Operation Overlord".

22. The launching of the assault, on the Normandy beaches, was a well planned and well executed manouver. Our security regulations had been adequate. One of the costs of our stringent security restrictions, which barred all Free French personnel from access to place and date information (BIGOT), was to alienate forever the affections of Col. Charles DeGaulle. His 1966 bias against the U.S.A. and Great Britain is probably due to the damage suffered by his pride in 1944.

23. The seizure of the beachhead went better than anticipated. The worst catastrophe which beset "Operation Overlord" was the mid-June North Sea storm which wrecked the "Mulberry" (artificial harbour) of the American sector "Omaha". By 17 June '44 the situation on the continent made me feel ----"Now that the job for which I came over (to Europe) is practically finished, I am looking for another......The assault phase is now over and it is just a question of routine grinding out of missions to support the ground forces. That is not very complex and does not tax the imagination."

24. The original concept of "Operation Overlord" contemplated a battle plan which provided for a thrust from the beachhead southeast towards Falaise, thence a swing toward the west to Avranche, with the objective of pinning the mobile German forces against the west coast of Normandy. To make such an envelopment practical, the Allied Forces had to obtain control of the road net out of St. Lo. The stubborn German resistance in St. Lo was broken by a massive air attack, mounted by the 8th U.S. Air Force and RAF Bomber Command. The air attacks were successful and control of the St. Lo road net was secured by Gen. Patton's Army. Probes by patrols to the southwest and southeast revealed no substantial German forces. (V 17)

25. The surprising thinness of the German lines, and the failure of German reserves to appear in the area south of St. Lo, presented an opportunity to the Supreme Commander who sought the advice of General Bradley. The question was, should General Patton be held back? General Bradley's response was "let him run," and that is what General Eisenhower elected to do. He decided to let the U.S. 3rd Army run as far south as Avranche, then to swing eastward toward Domfront, thence northeast toward Argentan. Meanwhile, General Montgomery's British forces were to thrust from Caen toward Falaise to "close the neck of the bag". The closing of the "Falaise Gap" was successfully accomplished. The writer of this report had the advantage of being able to fly over the area soon after the metal cooled. Enemy losses of equipment were substantial.

26. When the "Falaise Gap" was closed by the Allied Forces, "Operation Overlord" was, for all practical purposes, completed. From then on the strategy and tactics had to be adjusted to the situation which brought daily surprises. We had contemplated a German stand along the line of the Seine, and a strong defense of their position in Paris. Actually they had thrown their last reserves into the effort to hold the Allied Forces in Normandy. The German forces left Paris to the French - practically undamaged by war - and withdrew toward the north. The V-2 rocket sites in the Pas de Calais area were a substantial threat to London and those sites were apparently regarded, by the German, as of greater military value than the city of Paris.

27. By mid-July 1944 it was obvious that the fast pace of events and the difficulties of cross-channel communications would necessitate a move of the Headquarters, Supreme Allied Commander, to the continent at an early date. The site selected was at Jullouville, 5 miles south of Granville, on the west coast of Normandy. A girl's school, with spacious grounds, had apparently been "requisitioned" by the Germans, and was therefore available for U.S. usage. Temporary

wooden buildings were soon erected on the grounds to provide a field office for the Supreme Allied Commander and his staff. Gen. Eisenhower moved to the continent, according to the newspapers, during the early part of August 1944. This event marked the end of the useful life of the Allied Expeditionary Air Force. (A 19)

28. By the end of July 1944 all manner of rumours were flying as to changes in organization and re-assignment of commanders. In early August 1944 Lt. Gen. Hoyt Vandenberg was relieved as Deputy Air Commander-in-Chief, AEAF, and was assigned as Commanding General 9th Air Force (U.S.). From 9th Air Force to AEAF were transferred Major Gen. Ralph Royce as Deputy Air Commander-in-Chief, AEAF and Brig. Gen. David M. Schlatter (ops staff). General Brereton was reassigned to duty as Commander of the newly formed Airborne Command. (A 19).

29. A temporary building, at the Jullouville site, was allocated for the use of the Air Commander-in-Chief, AEAF, but as far as I can recall, Air Chief Marshal Sir Trafford Leigh-Mallory did not make use of the facilities. His staff was of the opinion that a move of the AEAF Headquarters would be futile because of the inability to establish in Normandy an adequate communications service. It was the belief of the British Signals people of AEAF staff, that adequate communications service could be established when the Headquarters of the Supreme Allied Commander was moved forward to the environs of Paris.

30. Limited space was provided, in commercial buildings of Granville, for an AEAF liaison staff group. Communications, available to the staff group at Granville, were nil-both forward and backward. The writer of this report used that null as an opportunity to visit friends on U.S.A.A.F. aircraft bases and support bases in England, and on the continent. He also had an opportunity, during this interval, to ride on a few B-26 bombing missions.

31. When "Operation Overlord" was launched our strategy contemplated sealing off the Brittany peninsula on the land side. We would let the garrisons guarding the Brittany ports, which had served the U.S. Army so well in 1918, have control of their rocky, windy, fog-swept coast. The loss of the U.S. Mulberry (off OMAHA Beach) in the June 1944 storm and the shambles of wreckage left by the Germans, in the major ports of Cherbourg and Le Havre, raised a question as to the adequacy of our original strategy. It was General Eisenhower's decision that General Middleton would be provided with the military force and air support required to take the coastal fortifications of Brittany from the rear. The soil was rough and rocky, the land-side defenses had been bolstered, the German supply of ammunition had been maintained by cargo submarine. The defenses were not easy to crack.

32.(a) Shortly after General Royce had assumed the post of Deputy AC-in-C, AEAF (early Aug. 1944), I received, whilst in my Granville office, a frantic telephone call from the secretary on duty in the office reserved, in the Jullouville clutch of temporary buildings, for the Air Commander-in-Chief, Allied Expeditionary Air Force. General Eisenhower wanted to talk to Air Chief Marshal Leigh-Mallory or to his deputy, Maj. Gen. Royce. The secretary had been unable to contact General Royce or his senior Ops officer, Brig. Gen. Schlatter. A fast run by the writer to the air strip, just 2 miles S.E. of General Eisenhower's office, brought me face to face with the culprits. I passed the message: "General Eisenhower wants to see both of you." The response was: "Tell him we had departed for London." They climbed into a waiting C-47 airplane and took off. I returned to Headquarters and reported to Lt. Gen. Bedell Smith, with tongue in cheek and fingers crossed, that General Royce had departed by air for London, in order to confer with Air Chief Marshal Leigh-Mallory. Gen. Smith replied: "The General (Eisenhower) is in a bad mood - get somebody who can explain to him why the 9th Air Force has not supported Middleton."

TH

32. (b) It was late afternoon so I hopped in a liaison type airplane and flew south to the 9th A.F. (U.S.) headquarters near Laval (60 mi. S.E. of Jullouville). General Vandenberg climbed into the airplane with me and we returned to the Jullouville air strip. It was about 17:00 when we reached the Headquarters compound. General Eisenhower and General Smith had just left the Headquarters building and we met them on the walkway. The Supreme Allied Commander put his question to the Commander 9th Air Force and received in reply one simple statement: "We have responded to General Middleton's calls for support in every instance, and with all the airplanes we had available." General Eisenhower then walked to his car, without comment. General Vandenberg and I went back to the airstrip by car without further discussion of the subject.

32. (c) When we reached the air strip we were met by Col. Palmer, who was in charge of our liaison airplane operation. Gen. Vandenberg and Col. Palmer had served together previously, and they were having such a happy re-union that I hesitated to interrupt, although it was getting late. Finally, in order to get things moving, I suggested that Col. Palmer might like to pilot the airplane and return Gen. Vandenberg to his Laval base. This was agreeable to both the General and the Colonel. They took off, with plenty of daylight remaining for the return flight to Laval (60 miles).

32. (d) The next day, when Col. Palmer returned from Laval, he told a tale which staggered me. The Colonel, a command pilot, had in sixty miles lost his way, and had landed at dusk to ask directions. He was then just north of the Loire River in territory which was not yet cleared of German troops. Fortunately they were able to get oriented, with the aid of some French farmers, and to locate the Laval airfield before darkness fell.

33. In late August 1944 we had found in Versailles (a Paris suburb) a Headquarters site which suited Air Chief Marshal Leigh-Mallory. We first moved our AEAF liaison staff group from Granville to Paris. About 1 September 1944 we undertook the movement of the main AEAF Headquarters from Stanmore (London suburb) to Versailles. We had in Stanmore (Bentley Priory) excellent telephone service to all government offices and to all military installations in England. When we reached Paris we were shocked to learn that the telephone system of France was inoperative, not as a result of German sabotage, but as the result of a shortage of maintenance material and manpower. This was the blow that finished the Allied Expeditionary Air Force. (A 20, V 26, A 21)

34. By 1 October 1944 decision had been made to eliminate the Allied Expeditionary Air Force from the command structure of the Allied Forces. General Spaatz called in General Royce and myself to advise us of his intention for reassignment of the USAAF officers on duty with Headquarters, AEAF. (A 22, V 30)

35. The bad luck which Air Chief Marshal Leigh-Mallory had with his Allied Expeditionary Air Force command opportunity was not the end of his troubles. The Prime Minister, Winston Churchill, had the Air Marshal designated as commander of the British Forces in Southeast Asia. The Air Marshal and Lady Leigh-Mallory boarded a modified Lancaster bomber airplane for the flight to his new command post, where he was to relieve Admiral Lord Louis Mountbatten. The airplane "blip" was lost from the tracking radar scopes over the Bay of Biscay, and the airplane failed to make its first scheduled landing point. Sometime later it was learned that the airplane had hit a peak of the Pyrenees Mountains, along the border of Spain and France, and that all persons aboard had been killed.

HI.

36. The failure of the Allied Expeditionary Air Force to survive was not the result of a fault in concept but rather a fault of execution. For the Air Defense of Great Britain a static headquarters, equipped with a bombproof command post was essential. The RAF Fighter Command Headquarters at Bentley Priory (Stanmore) did serve very effectively during the defensive stage of the British war effort. For the assault phase of "Operation Overlord" the AEAF command post at Bentley Priory served very well. It was effective in coordinating the Tactical Air Force strikes with the Strategic Air Force strikes, and in providing fighter cover for the Allied Air Force strike missions. (A 21, A 22, V 30)

37. Whilst the uncooperative attitude of some USAAF personnel was extremely irritating and annoying, during the preparatory phase of "Operation Overlord", that attitude did not hamper the Allied Expeditionary Air Force command post during the assault phase. However, after the break-out from the beachhead area the AEAF commander, sitting at Bentley Priory, could neither get information from the field, nor could he communicate instructions to Air Force commanders at their advance headquarters in the field. The AEAF passed into oblivion, in the middle of a war, because the Air Commander-in-Chief refused to recognize the communications problem which the fast moving ground situation presented.

THIS PAGE IS DECLASSIFIED IAW EO 13526

HI:

IV-CONCLUSION

38. The Air Force Commander, whose mission is tactical support of ground troops in a fast moving land campaign, must have reliable, prompt, and secure communications with the Ground Force units to be supported, and with his own Air Force units. The surest means of communications is a face to face discussion of a problem in the top command level. When that type of treatment is not practical the courier, whether he be in a liaison airplane, in a staff car, on horseback or afoot, provides the surest means of securing information and of issuing instructions.

* * * * * * * * * * * *

18 Aug. '43 - A1...Well, the President has arrived (in Quebec) without having his train blown up, and the Prime Minister got here without having his ship sunk, and the conference (Quadrant) has been announced in the newspapers, so I guess I am, by now, released from my oath of secrecy. I have a grand room in the Chateau Frontenac.../ We left Washington Aug. 10th at 10:00 by special train and got here the next morning about 10:00... We keep the damndest hours - start at 8:30 a.m. and run to 7:30 p.m., have a drink, dinner 8:30 or 9:00 p.m., then often back to work until midnight... Our agenda calls for us to finish up on the 25th of August. I hope we may leave here by the 26th and be home by the 27th.

Refer to para. 2 - 6

CHI

21 Aug. '43-A2:...At the moment we are in a period of dead calm, whilst the Combined Chiefs of Staff (USA & UK) worry over a paper that we spent all Friday night writing./...(General) Arnold has reiterated that I am going to go (to London) but asks me what I am going to do about a replacement.... I will be in an awful fix if I have to sit in Washington until I can find a free agent who will suit

2-- 6 (Brig. Gen.) Kuter's fancy./ Anthony Eden and Cordell Hull moved into the Chateau Frontenac (Hotel) the other day, and I have seen them several times in the dining room, but so far I have not had a glimpse of F.D.R. or "The Prime"./ News from the war fronts is not bad. I still hold to my appraisal that I must go over this fall or not at all. This does not mean that I think the war will be over by Christmas '43.

THIS PAGE IS DECLASSIFIED IAW EO 13526

CHI

7 Oct. 43-A3:(from London)... I went to see (B.G.) "Bill" Kepner yesterday, but he was out. He surely inherited from Frank O'Day Hunter a fine setup. It is an old palace (imitation) which was first converted into a fairly modern country hotel (complete with golf course), and then into a USAAF Headquarters (still complete with golf course)(9th Air Force Fighter Command Hdqts.) The whole station is run by the Americans, so they have the heat on, which made me feel very sorry for myself ... I am stationed in an RAF Headquarters where heat is never thought of.../ We are shortly to set up a new Headquarters (Allied Expeditionary Air Force), but are at present only planning the organization...It will be, when established, a combined Hdqts. partly RAF and partly USAAF, so we will never be able to fix things up as luxuriously as Bill Kepner has things. They (9th Air Force Fighter Command) have been established where they are for eighteen months. I hope the war will be over, in this theatre, by the time I have been here 18 months... I have just returned from a meeting with our British Commander-in-Chief (Air Chief Marshal Sir Trafford Leigh-Mallory). The rascal held the meeting in a room which was as cold as outdoors - no fire at all - but he, the devil, sat there wrapped in a wooly rug which he constantly re-adjusted to keep snug and warm. My hands were like ice and my nose was cold and dripping....

8

THIS PAGE IS DECLASSIFIED IAW EO 13526

10 Oct '43-A4:...I am one of the few U.S. Officers who are stationed at an RAF station. Until (B.G.) Marriner came in yesterday, I hadn't seen any U.S. personnel, except for a few minutes at a time, for a week...I am not wishing I were back in the States. I am just suffering from the confusion of setting up a new headquarters under strange surroundings.....I had lunch with (B.G.) "Bill" Kepner and (B.G.) "Pete" Quesada yesterday. They have a beautiful well organized headquarters (9th Air Force Fighter Command). Life is not bad over there (Bushey Hall). Nor is it bad down where (M.G.) Hugh Knerr, Myron Wood and Marty (Martenstien) have their offices. (Hdqts USAAF-Europe, Bushey Park, near Hampton Court Palace: SW London Suburb).

0

21 Oct '43-V1---I had dinner the other night at Ira Eakers. It was given by Ira and "Possum" (Hansell) for (M.G.) Louie Brereton who has just arrived. (to take over 9th Air Force Headquarters at Ascot.)

9

22 Oct '43-A5:...The clerk at the Post Office advised that you address me as follows on V-Mail: Col. E.C. Langmead Air Force Section, Hdqts ETOUSA (European Theatre of Operations, U.S. Army). APO 887, New York, N.Y....according to the morning paper we have had an air raid every night for the last seven nights. I must have missed count, or slept thru some of them.

0

29 Oct. '43-A6:...The paper this morning carried a statement that during October (to date) the Germans dropped about 170 tons of bombs on England while the RAF and USAAF (8th Air Force) dropped 17,000 tons on Germany. That is 100 to 1 in our favor, and the Germans are getting a good kick in the pants from the Russians too.
0

29 Oct. '43-A7:...APO 633 is where Marty is stationed. (Hdqts USAAF-E at Bushey Park "Widewings"). APO 887 is a downtown Post Office (ETOUSA). I'll get mail addressed to either one (I hope), but I believe this one is better at present for V-mail or regular mail. Note: Please do NOT use Norfolk House, London, for V-mail or regular postal service-DO use for courier mail./ Actually we are going to have our own APO number (for U.S. component Hdqts. AEAF) as soon as we get completely organized out here (Bentley Priory-Stanmore) but that will be some weeks away.
0

19 Nov. '43-A8:...My new billet (I moved last Monday) is much warmer, and I am beginning to feel my blood thawing out a little. I expect to move (again) into an old imitation castle known as Stanmore Hall, about 1 Dec. '43.
0

THIS PAGE IS DECLASSIFIED IAW EO 13526

T

21 Nov. '43-A9:...As you know, I am on duty with a high Headquarters (AEAF) that has sections of its office spread all over town. We have only enough enlisted men to provide clerks, drivers, guards, etc. I had just enough to justify the opening of a little Post Exchange at my country Place (Bentley Priory, Stanmore, Middlesex). We opened Friday. It is a great convenience to our U.S. personnel and a great joy to all the RAF personnel on duty with us... A German 1000 pounder hit a crowded dance hall a week ago. We were therefore all pleased to read in the newspapers yesterday that on Thursday the RAF dropped over 350 of the 4000 pounders on Berlin. Berlin may not contain many military objectives but I'd like to see it "Hamburgerized" before the war is over.

0

28 Nov '43-V2: Today I am "celebrating" the end of my second month in this theatre. It is a good thing that I do not get paid by the job - I wouldn't have a cent coming to date,..../ (Col.) Carl Crane, (Col.) Jack Sprague, and Col. (Morris) Frost from Tampa, arrived last week... They are out in the country about 20 miles southwest of here. (Ascot - Hdqts 9th AF).

0

THIS PAGE IS DECLASSIFIED IAW EO 13526

TH

30 Nov '43-A10:...Life over here is the same as it was, only worse. I am trying to set up a high headquarters which a lot of people (USAAF-E & 9th Air Force) say is unnecessary and redundant. Consequently I have to overcome (lower echelon) opposition to get every man, every typewriter, every car. We try to do some planning for next year's combat operations as we organize, so I keep in a swirl of administrative detail and tactical plans. If, as the papers suggest, one George C. Marshal is coming over here to run the show, I wish he'd get here and decide does he or doesn't he want this damned organization I am trying to build.

10

15 Dec '43 -V3:...We finally got all the (U.S.) officers (72) to be assigned to our Headquarters (Allied Expeditionary Air Force). Now my troubles have changed, from trying to get the people, to trying to satisfy their demands for warm billets and offices...(Col.) Gus Shea has arrived...Capt. Engles walked in to report for duty this evening. I immediately detailed him as chief "scrounger" to locate additional stoves and electric heaters.

11

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCALSSIFIED

TH

Ask Isabelle (wife of Air Marshall Sir Harold Lydford - then on duty in Washington) if she remembers what Stanmore Hall looked like. She used to pass it as she went up the (Stanmore) hill to work at the canteen (RAF Fighter Command - Bentley Priory)

0

22 Dec '43-V5:...Had a telephone call from (Col.) Jack Sprague today. He had stopped in at my downtown office (Norfolk House, St. James Square, London)...This afternoon Col. Bienfang came out to ask if we had a spot he could fill...he is no longer on flying status. I have plenty of "ground level" hired hands and need now some air-minded thinkers. (Col.) M.M. Frost (from Tampa-the one you met at the Ballards) is working with me now...and has relieved me of a tremendous burden of detail connected with the establishment of the new organization (Hdqts. AEAF). This may be the last letter I send out bearing the old APO number and address (AAF Branch Hdqts ETO, APO 887 N.Y.)

0

26 Dec. '43-A11:...There is no disguising the fact that Londoners are a bit jumpy over the prospect that the new German secret weapon, of which they (the Germans) have been boasting, may be a battery of rocket guns, on the Calais cliffs, aimed at London. How effective they can be is anybody's guess. (Actually they were V-2 rockets)

0

27 Dec. '43-V6: Now... let's change address and the APO number to the one given in the upper right hand corner of this sheet (Allied Expeditionary A.F.-APO 656 N.Y.) I have not changed my job or my place of business, but we are now big enough to rate a separate APO number...I had no particular preference for Marshal or Eisenhower, but I surely was glad to see them finally designate somebody, so we can get on with the job. Time is a wastin' and it's getting late....

12

4 Jan. '44-V7:...today (Maj. Gen.) Bruce Butler (Deputy Air Commander-in-Chief, Allied Expeditionary Air Force) called me in...

0

11 Jan. '44-A12:...I have heard that (Henry) Hindley and his party couldn't reach agreement in the U.S. this last trip. (with respect to allocations of U.S. aircraft production for use by U.K. forces). It was the first time in two years that an agreement was not reached and signed within 45 days of opening negotiations (before the Munitions Assignment Board-Harry Hopkins, Chairman), and it was the first time that I was not there to serve as steering member(of the Aircraft Subcommittee). There could be some connection.../ I am, tonight for the first time, sitting in my boudoir at "Gremlin Castle" (Stanmore Hall near AEAF command Hdqts. at Bentley Priory, Stanmore, Middlesex)../ The nearer you get to a war the more concrete and simpler become your tasks. I do definitely prefer my work here to that I did in the Pentagon Bldg. I'll admit I handled more important projects there, but the emphasis is certainly off of production,allocation, and training now...over here I may again find a place where I can make important decisions. Meanwhile the pay is the same - and the chance of promotion here is the same-nil.

0

HIS

23 Jan '44-A13...Last night we had the heaviest air raid that the Germans have made since I got here four months ago...One thing you should remember about these air raids. We have an indisputable lead over the Germans in the building of heavy bombers. The night of Thu. 20 Jan. '44 the RAF dropped, according the newspaper reports, 2200 tons (of bombs) on Berlin. On the night of 21 Jan. '44 (Friday) the RAF and the Luftwaffe swapped punches. The RAF put 2000 tons on Magdeburg (and I don't mean the surrounding countryside) while the Luftwaffe scatted 200 tons all over the south of England. Unfortunately, circumstances (weather) on 22 Jan. '44 (Sat) prevented the U.S. bomber force from adding another couple of thousand tons on Germany./ I believe that when the story of the war is told, by the Gerans in years to come, you will find that the bombing of Germany has hurt them more than we suspect./ I do feel sorry for the German people, but the whole thing was their idea and we must keep after them until they say "Uncle" and mean it.

0

(S

23 Jan 44-A14:...Bruce (M.G. Bruce Butler) has rented a...house over in the neighborhood where Ira (M.G. Ira Eaker) used to live. "Ike" (Gen. Eisenhower) has taken over Ira s house.
0

29 Jan. 44-A15: Our headquarters organization (AEAF) is now built and almost equipped. The individuals are not very well trained in their jobs but are beginning to understand what they are to do.
0

5 Feb. 44-V8:...We have begun to use our title "Allied Expeditionary Air Force" in official correspondence and that helps to get people's minds straight as to who and where we are...
13

THIS PAGE IS DECLASSIFIED IAW EO 13526

IS

19 Mar '44-V9:...I had been in Gen. Brereton's Hdqts (9th AF) when I passed by (B.G.) Fritz Borum's office (Troop Carrier Command). He...insisted that I come over to his quarters...when I walked in I found (Col.) Barney Tooker and (Col.) Harold McGinnis. They are good stout, capable fellows and we surely could use a lot more like them-(in AEAF). The experience level (in AEAF), even in the rank of Colonel, is awfully low...(M.G.) Ralph Royce has just arrived (from Cairo) and will share with Fritz (Borum) a modest...(billet)...with central heat...and modern plumbing. (near Ascot)

14

THIS PAGE IS DECLASSIFIED IAW EO 13526

21 Mar, 44-V10: We are in a rather awkward period in our labors. There is so much to be done and so little time. But the lines of authority are not yet well established. Hence lots of things we would normally drive to completion are now left hanging on the decision of who is going to boss who. Last December they(USAAF-E & 9th AF) argued asto whether they wanted the organization we had built (AEAF). We won that argument and had about three months of peace. Now our organization is just finished and beginning to function, so we are going to open up the whole question again...By the time you get this (V-Mail Letter) you should have the letter (long-hand) I am sending back by Bruce (M.G. Bruce Butler). I really do hate to see him go, as he was in a tough spot in which he had not the authority to get done those things that are necessary. He has been a grand person to work for, and I do hate to see him take the blame for things that other people do not do, when he has no control over the people who are causing the trouble. What is to become of the remainder of the staff (U.S. component - AEAF) we do not yet know. But there will doubtless be several changes made when Hoyt V. (M.G. Hoyt Vandenberg) gets here. Whether there will be a major change in the staff setup (of AEAF) I do not know.

15-16

THIS PAGE IS DECLASSIFIED IAW EO 13526

IS

21 Mar, 44-V11...Van (M.G. Hoyt Vandenberg) has arrived, but I have not seen him yet. I have no idea what thoughts or instructions he has for making changes in organization or personnel. Certainly some of the present incumbents are due to be posted elsewhere. I really feel sorry for him (Gen. Vandenberg). He has a very awkward situation to face...
17

24 Mar. '44-V12...Van has been here a week but I haven't seen him to talk to him. All our Reserve Officers are getting restless. Rumours are flying thick and fast and the morale of our little group (U.S. component-AEAF Staff) is at a very low ebb. Six months of building-and then "Whoof".
17

24 Mar '44-A16:...Bruce (M.G. Bruce Butler) has been relieved. He and Maritzen (his aide) are returning to the States and will take this letter back for me. (M.G.) Hoyt Vandenberg is here to take Bruce's job (Dep. Air C in C - AEAF). I haven't had a chance to talk with Van yet, so do not have any idea what his instructions from (Gen.) Arnold are.../ The faults of our Air Force organization in U.K. are numerous, but it never did lay within the power of Bruce to correct them. It seems rather futile to send to jail a witness to a crime, on the charge that he didn't call for the police in a loud enough voice-whilst the boys who have committed the crime go merrily on their way. I feel sorry for Van (M.G. Hoyt Vandenberg).. Time is short and the inertia of our organization is great. He will have to be a miracle worker to accomplish much change./...Bruce (M.G. Butler) naturally does not feel highly complimented by his orders to report back to Washington...do not press him for details. You can tell him that I feel that he got the blame because we staff officers in the lower echelon couldn't get things done. But it was not within his power to correct the faults that had us stopped.
15-16

28 Mar 44-A17...I am still uncertain and confused as to the status of our Headquarters (AEAF) and my job. Some people think we are all washed up, while others do not agree. I will not be surprised at anything. They may even ship me back as they did Bruce.../. I have been here six months today. Nothing has worked out as we planned. It has been a rather trying six months for me, and I am glad it is past. I'll never work as hard again against as much opposition - mostly from our own (USAAF) people who are jockeying for the top positions.

THIS PAGE IS DECLASSIFIED IAW EO 13526

A lot of smaller heads are now following Bruce's (M.G. Bruce Butler). I could be on my way home, or to China for all I know, within a month. I surely would hate to leave this front row seat just as the big show starts.
0

11 Apr. '44-V14:...Fritz (B.G. Fred Borum) has his orders to go to the Med. (Mediterranean Theatre). Strick (B.G. Auby Strickland) has been relieved, and Si (Col. Mariner) and Earl (Col. Earl DeFord) are due to go also. (from AEAF Staff). They may go back home, or to the Med. I am the only one of the original (USAAF) gang that is left (with U.S. section AEAF staff). My future is not exactly secure, although I would be willing to stay on as water boy to be here for the big day.
17

22 Apr. '44-A18:...Fritz is down on the Med. by now, as is Earl DeFord.(Col) Si Marriner is leaving next week and is not happy about it. Knerr) is leaving in a couple of days for a trip back (to Washington). What is cooking I do not know...I would like to feel that we are all set for the big job, but(I) cannot feel secure in my present position...
17

THIS PAGE IS DECLASSIFIED IAW EO 13526

TH)

17 June '44 - V15:...Now that the job for which I came over is practically finished I am looking for another. I am not content to sit and try to find things to do in order to keep a comfortable billet (in England). I don't mean that the war is practically over - I came here to help write the plan and organize the Air Forces to support the assault. The assault phase is now over, and it is now just a question of routine grinding out of missions to support the ground forces. That is not very complex and does not tax the imagination.

0

THIS PAGE IS DECLASSIFIED IAW EO 13526

[H]

16 Jul, '44-V19:...We do not get much encouragement about getting home this fall, from the turn of events on the far shore. Apparently the German feels that hisflying bombs and rockets have a good chance to improve the peace terms he can negotiate, so he is going to hang on to the French Coast (in the Pas de Calais) until he has a good chance to do his stuff on London. If he could make London untenable he could bargain for calling off the war. If, on the other hand, his attempt to make London untenable fails, he has worsened his bargaining position. He is in a tough spot.

0

24 Jul, '44-V20:...Something is cooking over here in the way of a drastic re-alignment of top Air Force Commanders...Much as I would like to be there (in Washington) ...I do very much prefer to stay here until this thing is properly finished - which shouldn't be too long now. I think things in Germany look good from our point of view...additional military reverses are in store for them, and will bring further discord and trouble inside Germany.

0

30 Jul,'44-V21...Compared with the Air Force action against the industrial structure of Germany, and the Russian Army offensive on the Eastern Front, our Normandy land operation is a slow moving sideshow...It hurts our pride that we cannot get rolling like the Russians, but I do not feel that we have to insure the defeat of Germany this year...

0

THIS PAGE IS DECLASSIFIED IAW EO 13526

TP

2 Aug. '44-V22...The war, as of tonight, is in a fluid confused state. We seem to have made a startling bit of progress-if we don't get kicked in the pants, in the next day or two, we should have a greatly improved position by the time you get this letter...

0

11 Aug. '44-A19:...I am getting to the point where I am willing for the war to end any day now. I have had my fill of exciting moments, hours of suspense, and days of waiting for something to happen. Any time anybody, with good aim, wants to draw a bead on Mr. Hitler it will suit me fine...Gen. Fred Smith left hurriedley for home. He received word that his child was very ill...Van (M.G. Vandenberg) has left (AEAF) to take command of the Ninth Air Force and General (Ralph) Royce has come over (from 9th AF) to take Van's job (Deputy Air Commander-in-Chief-AEAF). He brought (B.G. David M.) Schlatter along to take the job Fred Smith had. (M.G.) Brereton has taken over a newly formed Airborne Command (on leaving 9th Air Force)...it was released to the press today. 0

25 Aug. '44-V25...I am still optomistic over it (the war) ending this year.
0

25 Aug. '44-A20...We moved (Advanced AEAF Hdqts) from England to a place on the west coast of France (Jullouville-5km south of Granville on the Normandy coast), and then on to a place further inland - not far from Paris (Versailles)...In England there was very little "black market" dealing. Over here (in France)everybody cheats on everything. There is no strong central government-it is a mess.
33

IS

6 Sep. 44-V26:...I flew across the creek (to England) on the first of Sept. [to direct movement of Hdqts AEAF (U.S. staff) to a forward location in Versailles (Paris suburb) France], and have just returned (to France). I will be (traveling) back and forth for...weeks before I can come to rest on the other side (France)... He (the German) has lost about 500,000 men.
33

10 Sep. 44-V27:...I am completely "Geschmozzled" by the urgent necessity of moving across "The Creek". Of course I would end up as the chief worrier for the whole outfit.
0

21 Sep. 44-A21: This has been a hectic month to date. We did not have an organization that was intended to be mobile, so when we had to move it was a discouraging task-to make matters worse, we moved not once, but twice. The battle moved so rapidly that the site first selected (Jullouville) became too far back...Paris looks a bit dirty and unkempt, but it is not, of course, damaged like London... Thanks for thinking of me on that day (3 Sept.'44-my 50th birthday) - it was a bad one for me because of complications at the office. Our organization (AEAF) has done its job, but I have great difficulty convincing people that we are due to reduce the staff and not increase it.
33

TH

1 Oct. 44-V28:...My letter dated 29 Sept. was the last one I wrote from Stanmore (England). I had gone back to spend a few days collecting my trunks, bags, and laundry...Today (M.G. Ralph) Royce and I had lunch with (Gen.) Spaatz in his chateau (St. Germain - Paris suburb).
0

4 Oct. 44-V29:...Our APO number moves along with us and will stay the same until I change my organization, which I will soon do.
0

10 Oct. 44-V30:...I have just left Air Chief Marshal Leigh-Mallory's farewell cocktail party (Versailles). I don't know which of us felt the worst over having AEAF fold up. It was inevitable but--it is--depressing--even if it had served its purpose.
34

13 Oct. 44-V31:...Both (Maj. Gen.) Ralph Royce and I are on the auction block...We have a tentative project that will, if it eventuates, take us out into the sticks. (B.G.) Ned Schramm is also out of work and expects to join us, if our project goes thru.
34

THIS PAGE IS DECLASSIFIED IAW EO 13526

TH)

15 Oct.'44-V32: The war is marking time in this theatre while both sides drag up their supplies and prepare for the next push. In equipment and reserves we have the upper hand and so, barring bad luck, we should be able to do the pushing. If the German is stubborn, and fights as he did in Normandy, we may be able to secure a decision this fall. If he conducts a strategic withdrawal, as he knows how to do, we will have to chase him a long way before we can really put him in a corner...The Allied Expeditionary Air Force is about to pass out of existence. Our Air Officer Commanding-in-Chief (Sir Trafford Leigh-Mallory) is about to be posted elsewhere, and I presume that when he goes I will be re-assigned elsewhere too. I am one of the few charter members still left with the organization. We formed our group to plan the assault, organize the forces (Air, Ground, Naval) and to direct the employment of forces at a time when close coordinated action of all elements was required. That job has now been done, and the need for our Headquarters has ceased to exist.

34

TH

15 Oct. '44-A22:...,but am now back on duty winding up the affairs of the Allied Expeditionary Air Force. It had a big job to do at one time. We actually wrote the basic plan for the Air Force support of the landing operation in Normandy. We organized the forces and supervised their training and did direct all the (combined) Air Forces in the interval just prior to and after D-day. By the end of July our job was finished, and we have been trying to close out ever since... These people (in France) have never put their hearts into this war, and now they consider that for them the war is over...Everybody considers blackmarket trading a routine necessity. Everybody has plenty of money in Paris - but noone has ever explained to me just how they get ahold of it...
I am enclosing...a little invitation I received to a farewell party for L-M (Air Chief Marshal Leigh-Mallory). The party was the stiffest thing I ever attended. L-M did not want to leave and the atmosphere was not one of gayety and pleasure. There surely was a lot of rank around...(The function was held at the Hotel Trionon, Versailles on Mon. 9 Oct.'44 in the General's Mess).

Italian Mainland Sighted As Allies Push Forward Along Sicily's East Coast

General Advance Sees Capture of Guardia – Canadians and U.S. Troops Converging on Randazzo, Last Ditch Defense of Messina Bridgehead –Fight Stubborn Axis Retreat

Allied Headquarters, North Africa, Aug. 11—Allied armies pushing north along the east coast of Sicily, have captured the town of Guardia, in an advance of two to three miles, Allied Headquarters announced to-day.

They came within sight of the toe of the Italian boot for the first time. Only 14 miles to the north lay the Axis base of Taormina.

On the north coast American forces "consolidated the positions reached in the successful landing operations at the mouth of the Rosmarino River reported yesterday," the Allied communique said.

"Progress continues to be made whilst our troops overcome enemy resistance and deal with obstacles he is leaving."

IDEAL FOR DEFENSE

Advancing Canadian and American columns converging on Randazzo, key to the Axis last ditch defense of the Messina bridgehead, found the mountain roads blocked by masses of volcanic rock torn from the hills by Nazi dynamite crews while small units of machine-gunners entrenched in strong points protected in some places by barbed wire, picked away at the attacking forces.

The fall of Randazzo appeared imminent, however, as the Germans continued to withdraw the bulk of their forces and equipment and reports placed the Allied columns within seven miles of the mountain town.

Advance patrols of the American 7th Army moving in a line almost directly east from Cesaro in the interior were reported to have made a junction with Canadian units rounding lofty Mount Etna from a northeasterly direction.

FIND HIDDEN ROAD

One of the riddles of the stubborn Axis defense was solved and partly liquidated yesterday when Allied officers discovered that heavy artillery hammering at their columns operating along the San Agata-Cesaro line had been brought up over an unmapped mountain road. The road, discovered by air reconnaissance, was apparently an old mountain trail which the Axis forces had painstakingly hewed out to a 12-foot width, just sufficient to bring up heavy equipment.

Randazzo itself was little more than a heap of blazing rubble as Allied bombers returned again and again to pound German artillery parks, ammunition dumps, troop concentrations and important highway junctions.

Wreck Or Take 1,421 Airplanes From Sicily Foe

Allied Headquarters, North Africa, Aug. 11—The Allies have destroyed or captured 1,421 Axis planes during the Sicilian campaign, authorities revealed to-day.

Captured on Sicilian airfields were 999 enemy aircraft, a surprisingly large number still serviceable.

Aside from Axis planes wrecked or damaged aground, 422 were destroyed as against Allied losses of 181 in the Sicilian campaign.

More than 60,000 tons of enemy transport and warships were destroyed by air action.

GRACIE FIELDS IN BRITAIN

London, Aug. 11—Gracie Fields, English comedienne, arrived to-day by plane from the United States.

RED ADVANCE GETS NEARER TO KHARKOV

Nazis Weaken Other Fronts To Bolster Bastion—Chase Germans East of Bryansk

Moscow, Aug. 11—The German high command drained of tank and infantry strength from other fronts to reinforce the defenders of Kharkov to-day, but Red armies rode roughshod over the stiffened resistance and the fall of Russia's fourth largest city was believed imminent.

Some 250 miles to the north, other Russian forces sweeping along the railroad from Orel toward Bryansk, main German central front stronghold, broke enemy resistance at Khotynets, 44 miles east of Bryansk, and pushed on in hot pursuit of retreating Axis troops.

Russian forces overran village after village in converging drives on Kharkov from the northeast, north and northwest while other Soviet columns smashed to within $13\frac{1}{2}$ miles of Sumy, 12 miles of Aktyrka and 45 miles of Poltava, three of the main German strongholds northwest and west of Kharkov.

More than 70 towns and villages fell to Russian forces near Kharkov.

Stary Saltov, 25 miles east of Kharkov fell and over 1,000 of the enemy were killed.

Other columns captured Liptsi, $12\frac{1}{2}$ miles northeast of Kharkov, and Rogodyanka, $12\frac{1}{2}$ miles to the northwest, and drove southward along the Belgorod railroad from a point only 11 miles north of Kharkov.

Scarboro Girl War Workers Pass $4,000 Mark For Fund

Grand Total To Date: TWO MILLION and $64,383.47

Girls of the change houses at General Engineering Co. Ltd., plant at Scarboro have passed the $4,000 mark in donations to The Evening Telegram British War Victims Fund.

The groups contributing were joined by a new change house yesterday, when Change House 20 East sent along its first donation of $100. Change House 24, which has been a regular contributor over a period of months, also has another donation of $100 ready.

The girls of Change House 17 originated this plan and have contributed more than $2,000 to date. They were followed by No. 18, which has sent in approximately $1,500. Under the plan, the girls attempt to contribute at least a cent from their change every day. There is a friendly rivalry between the competing change houses.

Yesterday's contributions, totalling $395.40, are listed on page 23, with Young Canada's Honor Roll and stories and pictures of other fund events.

Conference May Portend Wider Use Of Canadians In New Allied Strategy

Prime Minister Churchill Attends Meeting of Canadian War Cabinet in Quebec While British and Canadian Chiefs of Staff Study "Blueprint for Victory"

By MARGARET AITKEN
Telegram Staff Reporter

Quebec, Aug. 11—Synthetic secrecy and robust rumors have stirred this Canadian bastion to its very foundations. To-day, rumors and actualities are sorting themselves out.

The Prime Minister of Great Britain has attended a meeting of the Canadian War Cabinet, presided over by Rt. Hon. Mackenzie King, and presumably gave the Dominion ministers a review of the war situation.

Meantime, an official statement said: "Canadian chiefs of staff are meeting the British chiefs of staff throughout the day." These conferences are taking place in the heavily guarded Chateau Frontenac.

At a later date and at an unspecified location the President of the United States will join the two Prime Ministers in conference.

"WE WANT CHURCHILL"

Mr. Churchill was accompanied to the Cabinet meeting by Sir John Anderson, Lord President of the Council. He drove down from the citadel in a staff car, accompanied by Mr. King. The local populace and members of the staff crowded the entrances to the courtyard and shouted "We want Churchill" as he halted at the entrance to receive greetings of the War Cabinet members.

The British leader looks as hale and hearty, as robust and cheerful as ever he did. With twinkling eyes and benign countenance, he good-naturedly posed for pictures but uttered no words. Only in actions did he speak to the gathered throngs. Mr. Churchill gave the famous V salute.

On the streets and outside the great chateau's arched gates, Quebec citizens lined the roads to greet this beloved buccaneer who asked for the tools in 1940 and has used them to deadly advantage ever since.

Accompanied by Sir John Anderson, Lord President of the Council, the Prime Minister arrived in a military car driven by Sergeant J. J. Harravin, of Ottawa. Before entering the Chateau he and Prime Minister Mackenzie King posed for pictures. With them were the Cabinet Ministers of Canada's three services, Hon. J. Ralston, Minister of Defense; Hon. Charles Power, Air Minister, and Hon. Angus Macdonald, Navy Minister.

Garbed in what the English term "a business jacket," striped trousers, a black homberg hat and an infectious grin, Mr. Churchill puffed at his long black cigar, waved the V signal and generally exuded friendly good cheer. He looks as if his 3,000-mile trip from London to Quebec had been both healthful and restful.

All members of the war committee of the Canadian Cabinet are here, which is taken as an indication that decisions of the highest importance as to use of Canadian forces may be expected. Speculation as to an enlarged use of Canadian forces is already rife.

Within the majestic confines of the Chateau Frontenac Hotel the Prime Ministers of Britain and Canada, with their military and secretarial staffs, are in full discussion. With the help of Canada's military and civil police, their privacy is complete.

NO LAW SUITS

Indeed, so complete is this privacy that the hospitable Chateau is a rather pitiful sight in its splendid isolation. Nearly 600 guests were turned out into the cruel world and 1,600 reservations cancelled to make room for this war conference. It is reported that many of the cancelled guests were extremely angry. For what seemed to be without rhyme or reason some 1,600 holiday and business-bound visitors were flatly refused rooms, even though reservations had already been made. Some of the rebuffed guests were so irate they threatened to bring some kind of a breach of promise suit against the hotel. Thereupon the Government acted quickly. Should any one of those 1,600 would-be guests resort to the law courts, they will find themselves involved in a legal action against, not the CPR, but The King.

FIERY TRAIL MARKS PATH OF BOMBERS

Nurnberg's Crowded War Plants and Rail Lines Heavily Attacked By Two Forces

London, Aug. 11—A mighty British-Canadian air armada, hundreds strong, stabbed deep into Germany last night to hurl at least 1,500 tons of explosives on the arms and transportation centre of Nurnberg.

The four-engined bombers blazed a trail of fiery destruction through a city crowded with submarine and airplane works, tank factories and other arms plants.

Sixteen bombers were lost in the raid, the second on Germany in as many nights.

The Air Ministry described the Nurnberg attack as "very heavy," a hint that the weight of bombs dropped may have approached the 2,300 mark reached in two of the recent nine raids on Hamburg.

In addition to being the site of at least 17 arms plants, Nurnberg is "one of the most important railway and industrial centres in southern Germany," the Air Ministry communique said.

Formation after formation of four-engined Stirlings, Halifaxes and Wellingtons flew some 1,300 miles round trip to drop their cargoes of high explosive bombs ranging up to four-ton super block-busters, and tens of thousands of incendiaries.

A number of German night fighters were encountered and at least three were shot down, the Air Ministry said.

The raid came on the eve of the fourth anniversary of Reichsmarshal Hermann Goering's famous remark that not a single enemy plane ever would bomb Germany's Ruhr valley.

An official Air Ministry summary disclosed, by contrast, that the RAF bomber command alone dropped 136,100 tons of bombs on Germany between Sept. 3, 1939, and last July 31, including 68,700 tons on the Ruhr.

A Zurich dispatch published in the Stockholm newspaper Dagens Nyheter said a traveler from Germany reported that the Nazis were preparing to evacuate the government from Berlin to a "secret destination" because of Allied hints that the German capital is marked for destruction from the air.

German air raiders made their first attack on Britain this month last night, dropping a few bombs over East Anglia.

Drew Undertakes To Form New Ontario Government Without Any Coalition

Will Assume Office Next Week — Confident 22-Point Program Will Win Support

Progressive Conservative Leader George Drew will form a new government for Ontario without a coalition early next week, it was announced at Queen's Park to-day. Mr. Drew was invited by Lieutenant-Governor Albert Matthews to form a government and accepted the invitation.

This was announced after Premier Harry Nixon had tendered his resignation.

"The government will be a Progressive Conservative government," Mr. Drew declared. "It will take office early next week on a day to be agreed upon between Mr. Nixon and myself."

NIXON RESIGNS

The preliminary events leading up to the change commenced when Mr. Nixon conferred with His Honor tendering his resignation and those of the Cabinet which will be held until Mr. Drew takes office. After this conference Mr. Drew was called to His Honor and with C. F. Bulmer, clerk of the executive council, was in conference with His Honor for a half-hour, later announcing his plan for a new government.

"I believe that our 22-point program will win support in the Legislature as it has with the people of Ontario," Mr. Drew declared in stating his Government will stand alone.

"In these increasingly serious days I hesitate to believe that the members of either of the other parties in the Legislature will vote only on the ground of political expediency. That being so I anticipate no difficulty in gaining support for every measure which will be introduced.

"MAKE ONTARIO WORTHY"

"I hope that all of us can join hands in a united effort to make Ontario worthy of the young men and women whose welfare must be our first consideration. Victory opened great new fields of opportunity. But there is much to be done at home. It will take the best that is in us to win the peace."

The decision to play a lone hand came as a surprise to Liberals who argued a coalition was necessary. They said either Mitchell F. Hepburn, once Premier, or St. Clair Gordon, the outgoing treasurer, would be their group leader and should be taken into a coalition cabinet.

Hitler Army Prepared For Action

London, Aug. 11—Hitler has begun a huge expansion of his private elite S.S. army as a precaution against a sudden collapse of the German armed forces or a military coupe to overthrow him and the Nazi party, reports reaching London said to-day.

The S.S. elite storm troopers, known more properly as the "Waffen S.S.," is estimated to number between 15 and 20 divisions or more than 500,000 men, compared to two or three divisions at the outbreak of war.

It has been trained for street fighting and since 1941 has been quietly establishing small barracks and machine-gun posts at strategic points in all large German cities.

All signs point to its employment by Hitler as insurance against Mussolini's fate overtaking him and to prevent a crack-up in civilian morale under the impact of the Allied air offensive.

The Waffen S.S. possesses every modern weapon, including tanks and heavy artillery, except an air force, which Reichsmarshal Hermann Goering always has prevented it from getting.

The elite army is commanded by Gen. Kurt Daluege, a ruthless Nazi former police chief, under the supreme command of Gestapo Chief Heinrich Himmler.

First Mobile Hospitals To Serve At Front Lines

Full Surgical Facilities Will Be Included in Two Units Now Being Organized in Canada

Ottawa, Aug. 11 — Two mobile general hospitals, first such units in the Canadian Army, are being organized, Defense headquarters announced to-day. They will be under command of Lt.-Col. J. A. A. Harcourt, Toronto physician, and Lt.-Col. Pierre Tremblay, permanent force medical officer, who went overseas with a field ambulance in 1940.

The new hospitals will serve just behind front-line scenes of action and provide full surgical and pathological facilities for treatment of casualties. In each, one or more complete surgical teams, consisting of surgeon, specialist in medicine, radiologist and anaesthetist, all holding the rank of major, will furnish operative and post-operative treatment.

A dental officer and two assistants will specialize in treating injuries to jaws and dentures and will assist plastic surgeons.

There will be 20 nurses on the staff of each hospital, in charge of a matron and assistant matron. In addition, a pool of nurses will be attached to each hospital, from which emergency teams for front-line evacuation duty will be drawn. The nursing sisters will work nearest to battle-lines of any members of their profession.

HANDLE SERIOUS CASES

The aim, the announcement said, is to transport serious cases back to permanent base hospitals as quickly as possjble. The casualty is first treated at his regimental aid post, then dispatched back to a field ambulance, thence to field dressing stations farther behind the lines, where emergency medical or operative treatment may be given before transfer to mobile general hospital. These units hold only cases too serious to move, or those which can be returned to action quickly. All other casualties are sent back to base hospitals with maximum speed.

Fully equipped to handle all types of surgery, the new establishments will offer the first opportunity of operative treatment in a hospital to a majority of casualties requiring such treatment. Other surgical units will be functioning in the field but these handle only cases requiring "on-the-spot" surgery.

Patients in the new hospitals will be afforded all the facilities of much larger base hospitals. Complete X-ray and laboratory equipment will be carried, in charge of a specialist in radiology. Latest anaesthetic techniques will be employed, using most up-to-date devices, by highly-trained army doctors specializing in anaesthesia.

STUDY TROPICAL DISEASES

It will be possible to combat shock and extreme loss of blood by the most modern techniques, use of blood substitutes (plasma) and whole blood in transfusions. Highly-mobile transfusion equipment operating

German Escapes

LIEUT. EGBERT J. BROSIG, German prisoner of war, who has made his second escape in a little more than a year. He got away from an internment camp near Monteith, 45 miles southeast of Timmins, where officials discovered a long tunnel in which a number of prisoners were hiding. The tunnel had been dug under the huts in the camp and led far beyond the camp boundaries. Brosig was the only prisoner missing when a check-up was made. When he escaped last year Brosig made his way to New York State wearing his Luftwaffe uniform with British decorations, including the D.F.C.

ESCAPED NAZI BEING SOUGHT AT MONTREAL

R.C.M.P. Combing Area and Surrounding Districts — Discovery of Tunnel Foiled Mass Break

Montreal, Aug. 11 — Search for Eckhert Brosib, 25-year-old German parachutist who escaped from an internment camp at Monteith, Ont., earlier this week, spread to Montreal to-day as Royal Canadian Mounted Police began combing the area and surrounding districts. It is Brosig's second escape.

According to R.C.M.P. officials Brosig speaks excellent English. On his last attempt to escape he got as far as the United States border 500 miles from the camp, before being captured. He was still wearing his German uniform when captured.

While one prisoner made his escape from the camp Saturday night, the discovery of a tunnel with dozens of Germans crouched under

FDR PREPARES FOR MEETINGS ON WAR PLANS

Problems of Fighting in Pacific Zone Canvassed by Council in Special Washington Conference

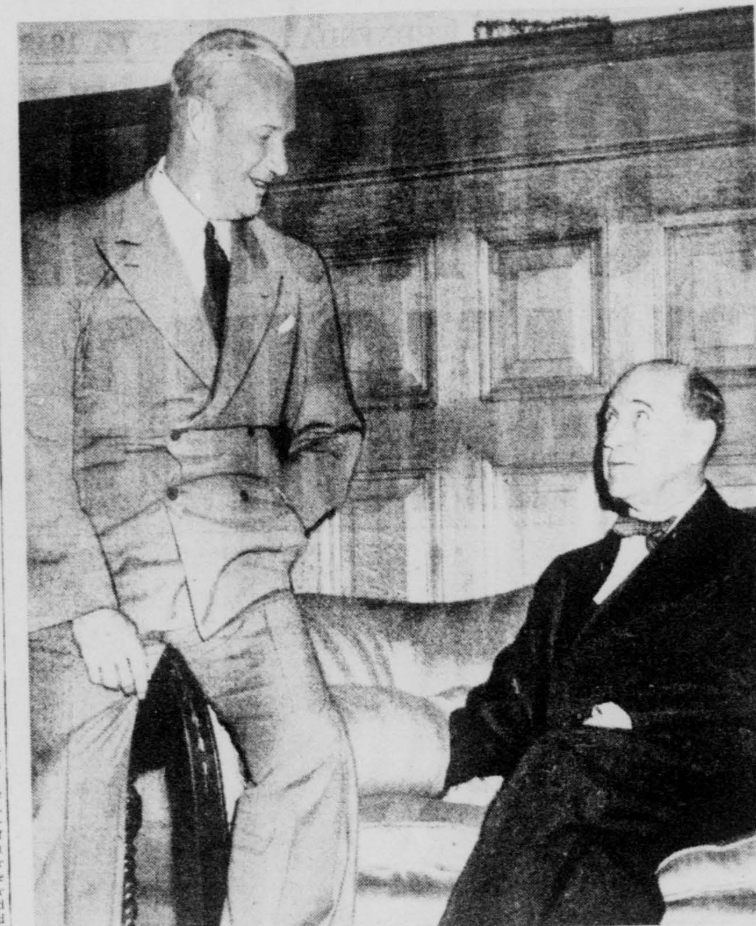
Washington, Aug. 11 — President Roosevelt discussed future strategy with the Pacific War Council today in preparation for his new and important conference with Prime Minister Winston Churchill in the near future.

Netherlands Ambassador A. Loudon, who acted as spokesman for members of the council, told reporters that the White House meeting was "very short—for obvious reasons," and that there was little that could be said about it except that future strategy was discussed.

Others who attended the conference were Sir Ronald I. Campbell, British Minister, representing Lord Halifax, British Ambassador, who arrived in England to-day; Canadian Minister Leighton McCarthy, Chinese ambassador Dr. Wei Tao-Ming and Australian Minister Sir Roland Dixon.

It was believed that the fast-changing war scene in Europe and the Far East will be surveyed in greater detail than ever before at the scheduled sixth conference between Mr. Roosevelt and the British Prime Minister.

China, though it will not be represented at the Churchill-Roosevelt conference, is a leading member of the Pacific War Council here. Other members include Great Britain, the Pacific dominions, the United States and the Netherlands.



The official announcement of Prime Minister Winston Churchill's arrival, said he would confer with the combined American-British chiefs of staff, as well as with Mr. Roosevelt that means that this country's four top military officers will help the President and the Prime Minister map Allied strategy. The United States is represented on the combined chiefs of staff by Admiral William D. Leahy, Mr. Roosevelt's Chief of Staff; Gen. George C. Marshall, Army Chief of Staff; Admiral Ernest J. King, Commander-in-chief of the Fleet, and Gen. Henry H. Arnold, Commander of the Army Air Forces

WILL LAUNCH 3 BIG FREIGHTERS IN SINGLE YARD

Canadian Firm Has Record With 10,000-Ton Vessels, States RCN Officer — Raft Equipment Superior

One Canadian shipbuilding yard next Saturday will launch three 10,000-ton freighters, "which is a record anywhere," Lieut.-Commander C. P. Harding, RCN, said in Toronto to-day.

Drew Accepts Invitation To Form Government

—(Telegram Staff Photo)

George Drew (left), leader of the Progressive Conservative party in Ontario, is pictured to-day in the office of Lieutenant-Governor Albert Matthews after receiving His Honor's invitation to form a government. Mr. Drew told the Lieutenant-Governor that he would be ready to take over the reins of office next week, without a coalition. Shortly before Mr. Drew was called to Mr. Matthew's office, Liberal Premier Harry Nixon offered his resignation to the Lieutenant-Governor. Acceptance of it is deferred until the Progressive Conservative assumption of power.

FDR PREPARES FOR MEETINGS ON WAR PLANS

Problems of Fighting in Pacific Zone Canvassed by Council in Special Washington Conference

Washington, Aug. 11 — President Roosevelt discussed future strategy with the Pacific War Council to-day in preparation for his new and important conference with Prime Minister Winston Churchill in the near future.

Netherlands Ambassador A. Loudon, who acted as spokesman for members of the council, told reporters that the White House meeting was "very short—for obvious reasons," and that there was little that could be said about it except that future strategy was discussed.

Others who attended the conference were Sir Ronald I. Campbell, British Minister, representing Lord Halifax, British Ambassador, who arrived in England to-day; Canadian Minister Leighton McCarthy, Chinese ambassador Dr. Wei Tao-Ming and Australian Minister Sir Roland Dixon.

It was believed that the fast-changing war scene in Europe and the Far East will be surveyed in greater detail than ever before at the scheduled sixth conference between Mr. Roosevelt and the British Prime Minister.

China, though it will not be represented at the Churchill-Roosevelt conference, is a leading member of the Pacific War Council here. Other members include Great Britain, the Pacific dominions, the United States and the Netherlands.

The official announcement of Prime Minister Winston Churchill's arrival, said he would confer with the combined American-British chiefs of staff, as well as with Mr. Roosevelt that means that this country's four top military officers will help the President and the Prime Minister map Allied strategy. The United States is represented on the combined chiefs of staff by Admiral William D. Leahy, Mr. Roosevelt's Chief of Staff; Gen. George C. Marshall, Army Chief of Staff; Admiral Ernest J. King, Commander-in-chief of the Fleet, and Gen. Henry H. Arnold, Commander of the Army Air Forces.

WILL LAUNCH 3 BIG FREIGHTERS IN SINGLE YARD

Canadian Firm Has Record With 10,000-Ton Vessels, States RCN Officer — Raft Equipment Superior

One Canadian shipbuilding yard next Saturday will launch three 10,000-ton freighters, "which is a record anywhere," Lieut.-Commander C. P. Harding, RCN, said in Toronto to-day.

Drew Accepts Invitation To Form Government

—(Telegram Staff Photo)

George Drew (left), leader of the Progressive Conservative party in Ontario, is pictured to-day in the office of Lieutenant-Governor Albert Matthews after receiving His Honor's invitation to form a government. Mr. Drew told the Lieutenant-Governor that he would be ready to take over the reins of office next week, without a coalition. Shortly before Mr. Drew was called to Mr. Matthew's office, Liberal Premier Harry Nixon offered his resignation to the Lieutenant-Governor. Acceptance of it is deferred until the Progressive Conservative assumption of power.

Improvement Demanded In Enumeration System

Two Earth Shocks Of "Fair Intensity"

New York, Aug. 11—Fordham University's seismograph registered two earthquakes of "fair intensity" at a distance of 5,750 miles from New York yesterday morning, it was announced to-day. The direction from New York was not determined. The first occurred at 11.25.41 a.m., the second at 11.32.05.

JAPS REPORTED LEAVING FARMS COMING TO CITY

Board of Control Asks Justice Minister For Details of Supervision When Out of Internment

Detailed information on the supervision being kept over Japanese working on Ontario farms was requested to-day from Hon. Louis St. Laurent, Minister of Justice, by the Board of Control.

The board wrote a letter to Mr. St. Laurent for the information after receiving reports that many Japanese brought east from western provinces as farm laborers were "running around Toronto and had left the farms."

Controller W. J. Wadsworth told the board he had received complaints from employers of Japanese labor that the men had quit their work without notice and had drifted into other sections of the province.

"When one employer complained, National Selective Service informed him that there is no reason why the Japs, who are supposed to be in an internment camp, should not quit their work the same as any Canadian," declared the controller.

"Further, the employers of these Japs are forced to pay fare expense amounting to $23 a man to bring him down from the West. I think something is radically wrong when Canadians are controlled by Selective Service and prevented from moving from one job to another while these internees can move about at will, apparently without any control over them."

HUNT MARGIN 649 IN NORTH RENFREW

One Poll Still to Report — Conservative Receives Majority Soldier Votes

Pembroke, Ont., Aug. 11—C. E. Gallagher, returning officer for Renfrew North, announced last night that S. J. Hunt, victorious Progressive Conservative candidate in the Ontario general election of Aug. 4, ...

Gave Names to Enumerator, But Weren't on Voters' List, Citizens Complain

Complaints that soldier relatives did not receive proxy forms in time to have them returned before Aug. 4 were coupled with demands for improvement in the enumeration system which reached The Telegram yesterday with 193 replies to the questionnaire, "Were You Robbed of Your Vote?"

The replies brought to 1,260 the forms filled out by indignant voters who were disfranchised by the notoriously faulty enumeration which preceded last week's Ontario election. Many indicated that whole households and neighbors also lost their votes.

"My household normally contains four Conservative votes," wrote Forsey Page, 55 Mason blvd., North York, "but only one was registered at the recent election. My son, overseas since 1939, was denied his vote, as were my housekeeper and myself. My daughter in the CWAC at Ste. Anne's was the only one permitted to vote.

ENUMERATOR GIVEN NAMES

"The enumerator called at my home and was given the names, but they did not appear on the lists," Mr. Page said.

"My husband and two sons are overseas and we have had no word of any votes for them," said Mrs. A. J. Finn, a war worker of 6 Farnham avenue. "I work on munitions, so may have been out when called on."

"I gave the enumerator the names of my parents with my own," wrote Mrs. R. Ayres, 176 Chambers avenue. "Both my parents got a vote yet I did not. Also I have not received a proxy from my husband who is overseas."

Miss E. Isobel Barker, of 48 Montgomery street, found she had been left off the voters' list but could not appear before a revising officer because the sitting was for July 22 and she had to go out of town on vacation on July 17.

"I might add there were no proxy votes received for two brothers overseas," Miss Barker said.

BLOCK MISSED

"It may interest you to know that not one name on Queen street from Victoria street to Bond street was on the list," Alex Whitten, 32 Queen street east, advised. "Some of those whose names were omitted (from the voters' list) have been living at the same address for 30 years."

H. Johnston, 54 South drive, reported that his sister-in-law, Miss E. Atkinson, was disfranchised though her name was given the enumerator.

"In place of her name on the voters' list was that of 'F. Sleightholm, bachelor'," Mr. Johnstone said. "There is no such person."

DEADLOCK CONTINUES IN AIRCRAFT STRIKE

Meetings of Labor and Co...

carry the lifesaving fluids to forward medical units.

REBATE $200,000 ON WINDSOR HYDRO

Cut on Consumers' Bills to Equal 10 Per Cent. of Last Years Charges

Windsor, Aug. 11 — Gift of approximately $200,000 to Hydro power consumers served by the Windsor Utilities Commission is provided for in a resolution to be presented at a special meeting of the commission to-morrow night, Garnet A. Edwards, chairman of the commission's Hydro division, said to-day.

In addition, Mr. Edwards said, it is planned to reduce the first reading charge to domestic consumers from 3.1 cents per kilowatt hour to three cents.

Credits of 10 per cent. of the total amount paid by power consumers to the Windsor Hydro during the past 12 months will be given in the form of reduction of that amount from bills to be sent out, after approval has been received from the Ontario Hydro-Electric Commission.

Mr. Edwards explained that this 10 per cent. credit to be taken from the bills issued after the plan is approved will go to all types of consumers, domestic, commercial, industrial and street lighting.

military officials describe as an attempt to make a mass break from the camp.

Brosig's escape was not discovered until yesterday.

The tunnel in which dozens of German prisoners were huddled, extended more than 100 feet, and extended under the camp huts beyond the camp boundaries. Fortunately a double guard was on duty Saturday night, and suspicion was raised when a prisoner appeared from nowhere. Confusion was caused when the Germans refused to answer to their names, and in the excitement Brosig escaped. It is now believed he was a leader of the gang. At first the escaped prisoner was identified as Martin Bitterberg, and his description flashed across the continent.

IS FATALLY INJURED BETWEEN TROLLEYS

Caught on Devil Strip, Thrown by One Street Car Against Other

Trapped in the devil strip between two street cars on Church st., early to-day, John A. Macdonald of Rodney, Ont., was fatally injured when knocked by one trolley against the side of the other.

The injured man was removed to St. Michael's Hospital in an unconscious condition. His skull was fractured and he suffered from internal injuries. His death increases the traffic toll for the city to 44 deaths.

According to police, the man had alighted from a south-bound Church car at Queen st. He attempted to cross the intersection and was caught in the devil strip between the south-bound and a north-bound car.

The man is believed to have been hit by the south-bound trolley and knocked against the north-bound vehicle. He was found lying on the devil strip.

He informed his Kiwanis Club audience that Canada earlier this year planned to launch 144 10,000-ton ... but that the accomplishment will be in excess of this.

Canadian development of raft equipment has been so successful that details of specifications, rations and first aid equipment have been sought by the British Admiralty and naval organizations of the United States, Australia, New Zealand and South Africa.

"You can sink a lifeboat but you cannot sink a raft," said Lieut.-Commander Harding. "Sailors now prefer rafts to lifeboats and on many vessels, whalers, dinghies, wood and steel lifeboats are being abandoned in favor of the rafts developed by Canadians."

During one month the Queen Mary has made four trans-oceanic crossings and carried 22,000 troops in 30 days, he reported.

Will See Mr. Howe On Coal Situation

Mayor Advised Premier Too Busy at Quebec

At the suggestion of Prime Minister W. L. M. King, Mayor Dr. Fred Conboy will arrange an interview with Hon. C. D. Howe, Minister of Munitions and Supply, for the purpose of arriving at some decision to alleviate the critical coal shortage in Toronto.

Original plans called for His Worship to see the Prime Minister, but in view of the fact his time will be taken up during the next two weeks or more in connection with the visit of Winston Churchill to Canada, Board of Control this morning voted in favor of the changed plan.

Sicily Casualty

London, Ont., Aug. 11 — L.-Cpl. William N. Roberts, son of Mr. and Mrs. W. A. Roberts, of London, was wounded in Sicily, his parents were informed.

Navy Raids Italian Mainland

British warships have made two daring raids against vital defense positions on the Italian mainland, it was announced to-day. Just south of Naples, in a sheltered bay behind the storied island of Capri, is Castellammare naval base. (1) The warships steamed into that narrow waterway dominated by enemy coastal batteries and hurled salvo after salvo of shells against the Italian naval installations. To the south, on the Italian instep, is Cape Vaticano, (2) where the railway runs near the sea, carrying troops and war materials toward Sicily. Other warships came close to shore there and let loose at important bridges, which fell under the bombardment.

Prior to the elections there were numerous complaints of the faulty way in which the voters' lists had been compiled. Many people found that their names had been omitted from the lists. Many more may have made the discovery only when they presented themselves to vote. By now, everybody who has any interest in the subject knows whether or not the enumeration was accurate so far as they themselves are concerned, or whether faulty enumeration robbed them of their vote.

An accurate voters' list is an essential requisite for an accurate expression of the will of the electors. Careles[...] eration can [...] tion in any [...] jority is sma[...]

Dr. J. C. Bradley, Liberal candidate, and 2,508 for A. T. Sweezey, C.C.F. candidate.

Mr. Gallagher said one small outlying poll has still to report. Only 44 soldiers' proxy votes were presented in the entire riding, and of these Hunt obtained 21, Bradley 14 and Sweezey six. In the soldiers vote in Ontario military establishments Bradley polled 75, Sweezey 62 and Hunt 55.

Gunthers Mills, the poll which has not yet reported, is not considered likely to produce more than 50 votes at the most.

Liberal Has 695 Lead In S. Renfrew Vote

Arnprior, Ont., Aug. 11—Returning Officer Milton Stewart announced last night that T. P. Murray, successful Liberal candidate in Renfrew South in last Wednesday's Ontario general election, polled 4,921 votes, as against 4,226 polled by J. J. Foran, Progressive Conservative candidate. Mr. Murray obtained a majority of 695 votes over Mr. Foran.

The Renfrew South soldier vote in the several military camps was 58 for Murray and 35 for Foran, while the total proxy vote in the riding was 47.

Plurality Of 3,505 For Nixon In Brant

Brantford, Aug. 11—Official returns for Brant riding in the Aug. 4 Ontario election show Premier Nixon's re-election with a plurality of 3,505 over his nearest rival, Maj. Sydney Rogers, Progressive Conservative, it was announced to-day by James L. McCormack, returning officer.

Final official figures were: William Cuthbert, (C.C.F.) 2,131; Nixon (L.) 5,745; Rogers (P.C.) 2,240.

New Baby Home; House Burns

Galt, Aug. 11—The five-roomed cottage of Mr. and Mrs. A. Vezeau on the Galt-Hamilton Highway burned to the ground early to-day. Mrs. Vezeau had returned home from hospital Monday with a new-born baby.

WERE YOU ROBBED OF YOUR VOTE?

Prior to the elections there were numerous complaints of the faulty way in which the voters' lists had been compiled. Many people found that their names had been omitted from the lists. Many more may have made the discovery only when they presented themselves to vote. By now, everybody who has any interest in the subject knows whether or not the enumeration was accurate so far as they themselves are concerned, or whether faulty enumeration robbed them of their vote.

An accurate voters' list is an essential requisite for an accurate expression of the will of the electors. Careless or dishonest enumeration can switch the representation in any riding where the majority is small.

It is therefore important in the public interest, regardless of party, to know how far the method of enumeration which has been employed presents an accurate roll of those who are qualified to vote. Anyone whose name has been improperly omitted from the voters' lists is therefore invited to assist in checking the extent of error in these lists by filling out the accompanying form and forwarding it to the Record Room, The Evening Telegram, 233 Bay Street, Toronto.

...ernment Officials Fail to Bring Solution

Montreal, Aug. 11—The aircraft strike here—one of the largest in the history of Canada—now entering its second week, showed no signs of a break to-day.

Twenty thousand aircraft workers, engaged in making planes vital to Canada's war effort, walked out Tuesday, Aug. 3, when their request for back-payment of a cost of living bonus from July 1, 1942 to March 23 of this year was refused.

(In a joint statement from Ottawa shortly after the start of the strike, Labor Minister Humphrey Mitchell and Munitions Minister C. D. Howe stated the three plants affected, Fairchilds, Moorduyn, and the aircraft division of Canadian Vickers, would remain closed until the workers signified their intention of going back to work on the understanding they would not get the back-bonus.)

Yesterday a series of conferences attended by labor representatives and Government officials both in Ottawa and Quebec City, failed to bring a solution to the stalemate any nearer.

The strike was called by members of Aircraft Lodge, 712, affiliated with the International Association of machinists.

It has been claimed that a large number of the strikers are not unionized, but there has been no break in the strikers' ranks.

Silence About Kiska Renews Invasion Talk

Washington, Aug. 11—Prolonged silence on American military activity in the North Pacific raised new speculation to-day over the imminence of an invasion of Japanese-held Kiska Island.

The last reported action at Kiska was 12 days ago, on July 30, when a naval force shelled defense positions for the eighth time of the month.

Usually well informed quarters here profess to be without information on the fighting in the Aleutians since then.

Reconquest of the island has been a subject of speculation ever since the Japanese occupied it early in June, 1942.

Fair And Warm

Probabilities for Toronto and vicinity are: Moderate winds; fair and warm to-day and Thursday.

Georgian Bay region—Moderate winds, fair and warm.

Estimated low to-night—64.

Estimated high to-morrow—84.

Highest yesterday—80.
Lowest yesterday—65.
Lowest to-day to 8 a.m.—64.
Mean temperature yesterday was 70 or 2 above the average.
Highest temperature this date since 1841 was 95, in 1900; the lowest 46, in 1841.
Highest temperature this day a year ago was 76; the low 61.
Trace of rain in past 24 hours.
Sun sets to-night at 8.29 p.m.
Sun rises to-morrow at 6.18 a.m.
Temperature to-day at 8 a.m.—72.
Temperature at noon to-day—83.
Highest temperatures for the past 24 hours up to 8 a.m. for Ontario points outside Toronto were: Port Arthur 83, London 77, Kingston 77, Ottawa 76. In Montreal the high was 75, the low 62.

War Cabinet Meets Again With British, U.S. Staffs Study Plans For Victory

Quebec Talks Precede Conference Between Roosevelt and Churchill —Canadians Praised

By ROBERT W. KEYSERLINGK
B.U.P. Staff Correspondent

Quebec City, Aug. 11 — Winston Churchill, praising the Canadian participation in Sicily, expressed his happiness at being "back in Canada." He was officially greeted on the south shore of the St. Lawrence River not only by the Canadian Prime Minister, but also by the Lieutenant-Governor of the province, Sir Eugene Fiset, and Mayor Lucien Born, of Quebec City.

It was disclosed that the Canadian War Cabinet meeting at the Chateau Frontenac on Tuesday was not attended by Prime Minister Churchill, as his arrival took place after the meeting.

STAFF CHIEFS PRESENT

It was made known also that the chiefs of the British general staff accompanied the British Prime Minister and that they were accompanied by the chief of combined operations, the father of the Commandos and in charge of the Dieppe Raid, Vice-Admiral Lord Louis Mountbatten. The chiefs of the general staff, Gen. Sir Allan Brooke, Admiral of the Fleet Sir Dudley Pound and Air Chief Marshal Sir Charles Portal, as well as the chief of staff to the Minister of Defense, will have an opportunity while here to confer with the other high military leaders of both Canada and the United States and members of the Canadian War Cabinet to study the questions of general war strategy.

The Canadian war cabinet was again in session at the Chateau Frontenac to-day. No statement was as yet made of the personnel of the United States military mission except the official statement that the "Canadian war cabinet met with the general staffs of Great Britain and the United States." Before this conference is terminated a meeting between President Roosevelt and Churchill will be held somewhere while the general staffs will continue their consultations.

POLITICAL PROBLEMS

But speculation is centering also around other problems. Since it is assumed that an early knockout of the Axis is imminent, more than purely military considerations enter the picture. Political problems of a weighty character are also being discussed and have been discussed for some time in the press of the world.

It is pointed out that a knockout of the Axis might come as much due to activities on the eastern front as due to pressure from the air or the Mediterranean. It is also pointed out that the Axis includes Japan and hence China and Japan are deeply

Winner Of V.C. Dam Raid Hero With Churchill

Quebec City, Aug. 11—Wing Commander G. P. Gibson, holder of the Victoria Cross at the age of 24, is with Prime Minister Churchill's party.

Gibson led the squadron which burst the Moehne dams in the Ruhr Valley and at least temporarily paralyzed Germany's industrial heart.

He has a pleasant and easy manner and his round, boyish face breaks easily into a smile unless he is asked to talk about himself. When the war was still a couple of years away, he joined the RAF. Three days after the war began, in September, 1939, he was over the Kiel Canal on a bombing raid. To-day he has 174 operational flights to his credit. His last raid was over the Moehne dam on May 17, 1943, and within a week on May 24, he was decorated with the most coveted distinction any British fighter can hope for—the Victoria Cross.

Premier Vyacheslaff Moltov in Washington and the Soviet implication that the Sicilian campaign is not quite the answer is being noted. The Russians are pushing the Germans back and Russia has not consulted with either London or Washington on the setting up of the German freedom committee, the Polish committee in Moscow nor the Jugoslav body there.

An imminent knock-out of the Axis therefore raises these events to historical importance. It is not doubted by observers that these problems and the urgency of finding a common solution and a full understanding of the political plans for a liberated Europe between the western and eastern forces now liberating Europe, form a subject that the authors of the Atlantic charter, namely Churchill and Roosevelt, will be urgently examining.

FORECASTS EARLY ACTION

The result of their conference was expected to be demonstrated by action on one or more war fronts soon. It was recalled that the invasion of French North Africa followed one of their talks; that the invasion of Sicily was planned at their conference at Casablanca.

Meanwhile, correspondents here and in the United States were warned against violating security regulations regarding the movements of those connected with the current conferences.

Names of High United States officers who are here were not revealed, although an official statement said the "general staffs of Great Britain and the United States" met with the Canadian war cabinet yesterday.

cation has as yet been apparent that either Soviet Russia or China are officially represented except perhaps through observers.

The tone of the Soviet press recently in pointing out that according to their interpretation, a second front in 1942 had been promised

Admiral Percy W. Nelles, Lt. Gen. Kenneth Stuart, and Air Marshal L. S. Breadner, as were most members of the Canadian War Cabinet Committee. Defense Minister J. L. Ralston, Munitions Minister C. D. Howe, Navy Minister Angus MacDonald and Air Minister C. G. Power.

This picture might easily have been taken somewhere in the old world, but instead it is a street scene in lower Quebec City. The Citadel, high up on the historic palisades of the city, where Prime Minister Winston Churchill took up residence yesterday as the honored guest of the Canadian Government, looks down on such scenes as this in Quebec's Lower town.

Heard Chateau Made Ready For The Pope Or Mussolini

Rumor Busy in Quebec During Days of Suspense Before Churchill Arrival

Quebec City, Aug. 11—No rumor factory ever worked more busily or achieved more wonderful products of the imagination than did this old French Canadian bastion of the St. Lawrence while it waited in a ferment of seething suspense this past week-end for history to visit it again.

From the fact that motor lorries were everywhere disgorging American army troops, that hotel guests were being unceremoniously if not impolitely turned into the streets, and that Canadian naval craft were plying about the harbor, the population of this historic French Canadin stronghold could tell that something of major importance was about to break in their midst. And being used to having history spill itself hereabouts in fairly liberal doses, they emphatically didn't sell the coming event short in the forecasts that they spread of it in hotel lobbies and around the cigar counters.

VISITORS TURNED AWAY

Visitors who had long planned vacations in the city or the nearby Laurentian mountains lined up at the desks of suddenly pre-empted hotels only to be told, one by one, that no accommodations were available. For divertissement they gathered in small knots looking at the barred entrances of the Chateau Frontenac, where military cars and trucks unloaded vast quantities of baggage and crowds of nattily uniformed Waves and Wacs arrived to work for American military experts.

They counted the few lights showing in the windows of the upper stories and speculated on whom might be within.

The local habitants, aware of a strange stirring in the narrow streets for many days past, guessed that recently deposed Fascist chieftain Benito Mussolini, was in captivity, and being held.

Others guessed that King George VI and Queen Elizabeth were here; others argued as vehemently that it was King Victor Emmanuel and the Italian Royal family.

REFUGE FOR POPE

Even more imaginative minds argued that they had direct information that his holiness Pope Pius had suddenly removed to one of the great Catholic strongholds of the western hemisphere; his presence would not impede the bombing of Rome.

Only after the newspapers—in English and French—had announced clearly that Churchill was the distinguished visitor did speculation quiet. But the public interest was increased rather than diminished.

Shop-keepers suddenly found small busts of the British leader and found a ready sale for them.

For the newspaper contingent—who had been "in the know" in the matter of the conference for the past week and who had been helped to keep confidence in respect to it by the vigilance of an army of government censors—what for days had been an assignment of tedious, uncomfortable, nervous waiting for news and working hard on transmission suddenly became for a few brief moments an affair of wild physical melee such as would make the more strenuous periods of a typical Donnybrook Fair seem orderly in comparison.

Defer Quebec Meeting Of University Women

London, Ont., Aug. 11—Prime Minister Churchill's visit to Quebec City has made necessary postponement of the triennial meeting of the Canadian Federation of University Women from August 24-26 until the following week, August 31 to September 2, it was anounced here to-day by the president, Dr. Dorothy Turville.

Sessions are to be held in the Chateau Frontenac from which guests have been removed during the Premier's visit.

Mary Churchill Aide To Father

Prime Minister's Daughter With Quebec Party

Quebec City, Aug. 11—Mary Churchill to-day is acting as an aide de camp for her father.

And anybody who thinks that being an A.D.C. to a man like Britain's war leader is easy, does not realize the pace Prime Minister Churchill maintains when travelling on important war business.

Blonde, with the fresh pink complexion familiar in English girls, Mary Churchill is known to many Londoners as a frequent companion of her father when "Winnie" walks through London streets and receives ovations.

Only recently a picture was published of her father raising his hat to greet a cheering crowd when he delivered one of his historic addresses, this time at Guildhall. He was accompanied by a smiling A.T.A. subaltern, daughter Mary. She is the youngest of a family of four children, but already has seen active fighting and now beholds a new world for the first time.

History Seen In The Making As Allied War Chiefs Confer At Storied Canadian Citadel

By MARGARET AITKEN
Telegram Staff Reporter

Quebec, Aug. 11—The lid is off. The tense, taut air of suppression burst wide open at four minutes to four o'clock yesterday afternoon when official word was released that Prime Minister Winston Churchill and party had arrived in Canada.

For days there has been restrained speculation on this sixth wartime conference of Allied leaders which "might conceivably be the first conference held in Canada."

It has happened. In this historical city of Canada, at the beautiful Chateau Frontenac Hotel, history is in the making. Prime Ministers Winston Churchill and Mackenzie King are staying at the Citadel, Canada's official summer residence of the Governor-General, and all other confreres, excluding Mrs. Churchill and Subaltern Mary Churchill, A.T.S., are at the Chateau Frontenac. Prime Minister Churchill's wife and daughter are with him at the Citadel.

Last night Mr. King and Mr. Churchill dined together and conferred throughout the evening. Before Mr. Churchill's arrival Canada's war committee cabinet met with Mr King at the Chateau and this was the first such meeting ever held outside Ottawa.

For two days Canadian government officials have been waiting in the city of Quebec for this gathering of distinguished visitors. At a later unspecified place and time the leaders will confer with President Roosevelt.

Reporters have been gathering from all parts of the world although the most stringent censorship held sway until actual arrival of the Prime Minister.

The means by which Prime Minister Winston Churchill crossed 3,000 miles of Atlantic Ocean have not been disclosed to the public, but it is known that Mr. Churchill and his party travelled by train to the little French-Canadian town of Charny, near Levis.

There they were welcomed by three province of Quebec officials and thence motored across the Quebec Bridge to the Citadel, where Mr. Churchill, Mrs. Churchill, Subaltern Mary Churchill and Prime Minister Mackenzie King are staying.

Those on hand to welcome the British Prime Minister were Sir Eugene Fiset, Lieutenant-Governor of Quebec; Adelard Godbout, Premier of Quebec; Lucien Borne, mayor of Quebec, and the Prime Minister of Canada.

Details of the discussions now taking place at the Citadel are as meagre as hair on a bald man's head.

We are told that "Mr. King escorted Mr. Churchill and his party to the Citadel and had tea with them."

We are told that "during the evening the two Prime Ministers discussed the international situation."

We are told that "Mr. Churchill expressed his delight at being back in Canada and spoke particularly of the Canadian participation in the Sicilian campaign."

Actual arrangements for these meagre details are capably managed by the Wartime Information Board. Hand-outs, so far, have been the order of the day and proceedings go like this:

For some strange and unexplainable reason rumors suddenly begin to circulate among the raft of reporters dispersed around the hotel. And then invariably it happens. A uniformed WIB official rings his come-and-get-it gong. The gong is weak in tone, but powerful in results. Members of the Fourth Estate come running from all sides. They gather expectantly in the press room. With bated breath and eager outstretched hands the news hawks grab up their releases.

Immediately the excitement evaporates like a burst soap bubble. "Mr King dined privately with Mr. and Mrs. Churchill."

But there's always to-morrow. While the news front is quiet, the behind-the-sceens potentialities are awesome.

While waiting for these potentialities to become realities, meetings of momentous importance are taking place at the Chateau Frontenac Hotel, which has been commandeered by the government. The Clarendon Hotel, in the lower part of Quebec City, has been likewise commandeered, but for the recorders of these events, not the participants. There are 150 reporters from Canada, Britain, the United States and Russia gathered here and every modern invention for transmitting news has been set up in the hotel for our convenience. There are also censors close at hand.

CHURCHILLS ASKED TO VISIT TORONTO

Wife and Daughter Invited to Make Trip If Prime Minister Too Busy

An invitation to visit Toronto has been extended by His Worship Mayor Dr. Fred Conboy to Prime Minister Winston Churchill, Mrs. Churchill and their daughter who are now in Quebec. The telegram sent to Mr. Churchill reads:

"In the name of citizens of Toronto I extend greetings and a most cordial invitation to you, Mrs. Churchill and your daughter, Subaltern Mary Churchill, to visit this city during your stay in Canada. We realize now busy you are likely to be and that any trip may not be possible. However, if you are able to come, we shall be happy and highly honored to receive you.

"If, unfortunately, you are unable to favor us with your presence, we should like to have Mrs. Churchill and your daughter visit us as our guests."

Ruling Conquered Lands Feeding Starving People Problems Before Leaders

Churchill and Roosevelt Preparing for Quick Changes on European Scene, is View

By CHESTER BLOOM
Telegram Washington Correspondent

Washington, D.C., Aug. 11—President Roosevelt's statement at his press conference Tuesday afternoon that he would be meeting Prime Minister Churchill, now in Canada, placed beside the conferences Mr. Roosevelt has been having with his post-war planning experts, undoubtedly gives a clue to the major topics to be discussed by the two leaders. What has happened is that the new war is moving so much faster than its 1914-18 first edition that management of enemy territories is leaps and bounds ahead of planning.

Thus, both Britain and the United States have had to rush in civil administrators to North Africa and Sicily, provide emergency rations for the starving populace, and set up temporary controls without any authorizations from parliament or congress.

For example, eight teams of congressmen, non-partisan supporters of U.S. participation in a post-war world organization to enforce peace, are now touring the Middle West United States. They are trying to educate their countrymen in the need of American sharing of responsibility for preserving peace in Europe. They are urging a senate resolution with very laudable objectives.

RECOGNIZE ACTUALITIES

Two of these objectives are set forth as:

That the United States take the initiative in forming a world organization with authority;

To establish temporary administrations for Axis-controlled areas of the world as these are occupied by United Nations forces until such time as permanent governments can be established.

To administer relief and assistance in economic rehabilitation in territories of member nations needing such aid and in Axis territory occupied by United Nations forces.

The senate has not seen fit to even bring the topic up for discussion. Yet here are Britain and the United States, by force of circumstances, already in occupation of Axis territory in North Africa and Sicily, forced to give temporary relief, to set up temporary governments, to rehabilitate civil functions and put these countries on the way to helping themselves once more.

Obviously, Mr. Roosevelt and Mr. Churchill cannot wait for local politicians to settle, for example, what they think ought to be done in occupying Italy, establishing temporary governments there to maintain order and feed the populace. It may have to be done next week or the week after. And who can guarantee (by some long chance) that the same thing might not happen in France, in Belgium, in Holland—even in Germany within the next few months.

TERMS FOR ITALY

They must discuss also the question of terms for the beaten Italian government—undoubtedly proposals have been made and rejected—exactly what terms come under the heading of "unconditional surrender," or rather, what terms will be imposed under that heading. All sides must be agreed. Undoubtedly that was in Mr. Roosevelt's mind when he told his press conference that while he did not think the Russians would be participating in the conference with himself and Mr. Churchill, that did not mean they both would not be awfully glad to have them. At least the British and Americans must be agreed right down to the tiniest detail.

On that framework, the conference in Canada will proceed. That is why Mr. Roosevelt consulted all afternoon not only with all his military, naval and air force generals and advisers but also with his post-war advisers, Secretary of State Cordell Hull, Under Secretary of State Sumner Welles, Chairman Norman Davis of the Red Cross, Dr. Isaiah Bowman, Chief American Territorial Specialist at the Versailles Peace Conference in 1919, and Dr. Lee Pavolsky, special assistant secretary of state and specialist in post-war planning. Mr. Churchill and his staff unquestionably arrived in Canada with complete post-war plans of their own insofar as they apply to the governing of occupied territories. The Americans will present theirs, the plans will be threshed over, and unity arrived at for the final thrust home of the democratic daggers to the heart of the Axis.

Three Divisions

The rocks composing the earth's crust are grouped by geologists into three classes—igneous, sedimentary, and metamorphic.

History Seen In The Making As Allied War Chiefs Confer At Storied Canadian Citadel

By MARGARET AITKEN
Telegram Staff Reporter

Quebec, Aug. 11—The lid is off. The tense, taut air of suppression burst wide open at four minutes to four o'clock yesterday afternoon when official word was released that Prime Minister Winston Churchill and party had arrived in Canada.

For days there has been restrained speculation on this sixth wartime conference of Allied leaders which "might conceivably be the first conference held in Canada."

It has happened. In this historical city of Canada, at the beautiful Chateau Frontenac Hotel, history is in the making. Prime Ministers Winston Churchill and Mackenzie King are staying at the Citadel, Canada's official summer residence of the Governor-General, and all other confreres, excluding Mrs. Churchill and Subaltern Mary Churchill, A.T.S., are at the Chateau Frontenac. Prime Minister Churchill's wife and daughter are with him at the Citadel.

Last night Mr. King and Mr. Churchill dined together and conferred throughout the evening. Before Mr. Churchill's arrival Canada's war committee cabinet met with Mr. King at the Chateau and this was the first such meeting ever held outside Ottawa.

For two days Canadian government officials have been waiting in the city of Quebec for this gathering of distinguished visitors. At a later unspecified place and time the leaders will confer with President Roosevelt.

Reporters have been gathering from all parts of the world although the most stringent censorship held sway until actual arrival of the Prime Minister.

The means by which Prime Minister Winston Churchill crossed 3,000 miles of Atlantic Ocean have not been disclosed to the public, but it is known that Mr. Churchill and his party travelled by train to the little French-Canadian town of Charny, near Levis.

There they were welcomed by three province of Quebec officials and thence motored across the Quebec Bridge to the Citadel, where Mr. Churchill, Mrs. Churchill, Subaltern Mary Churchill and Prime Minister Mackenzie King are staying.

Those on hand to welcome the British Prime Minister were Sir Eugene Fiset, Lieutenant Governor of Quebec; Adelard Godbout, Premier of Quebec; Lucien Borne, mayor of Quebec, and the Prime Minister of Canada.

Details of the discussions now taking place at the Citadel are as meagre as hair on a bald man's head.

We are told that "Mr. King escorted Mr. Churchill and his party to the Citadel and had tea with them."

We are told that "during the evening the two Prime Ministers discussed the international situation."

We are told that "Mr. Churchill expressed his delight at being back in Canada and spoke particularly of the Canadian participation in the Sicilian campaign."

Actual arrangements for these meagre details are capably managed by the Wartime Information Board. Hand-outs, so far, have been the order of the day and proceedings go like this:

For some strange and unexplainable reason rumors suddenly begin to circulate among the raft of reporters dispersed around the hotel. And then invariably it happens. A uniformed WIB official rings his come-and-get-it gong. The gong is weak in tone, but powerful in results. Members of the Fourth Estate come running from all sides. They gather expectantly in the press room. With bated breath and eager outstretched hands the news hawks grab up their releases.

Immediately the excitement evaporates like a burst soap bubble. "Mr. King dined privately with Mr. and Mrs. Churchill."

But there's always to-morrow. While the news front is quiet, the behind-the-scenes potentialities are awesome.

While waiting for these potentialities to become realities, meetings of momentous importance are taking place at the Chateau Frontenac Hotel, which has been commandeered by the government. The Clarendon Hotel, in the lower part of Quebec City, has been likewise commandeered, but for the recorders of these events, not the participants. There are 130 reporters from Canada, Britain, the United States and Russia gathered here and every modern invention for transmitting news has been set up in the hotel for our convenience. There are also censors close at hand.

CHURCHILLS ASKED TO VISIT TORONTO

Wife and Daughter Invited to Make Trip If Prime Minister Too Busy

An invitation to visit Toronto has been extended by His Worship Mayor Dr. Fred Conboy to Prime Minister Winston Churchill, Mrs. Churchill and their daughter who are now in Quebec. The telegram sent to Mr. Churchill reads:

"In the name of citizens of Toronto I extend greetings and a most cordial invitation to you, Mrs. Churchill and your daughter, Subaltern Mary Churchill, to visit this city during your stay in Canada. We realize how busy you are likely to be and that any trip may not be possible. However, if you are able to come, we shall be happy and highly honored to receive you.

"If, unfortunately, you are unable to favor us with your presence, we should like to have Mrs. Churchill and your daughter visit us as our guests."

Ruling Conquered Lands Feeding Starving People Problems Before Leaders

Churchill and Roosevelt Preparing for Quick Changes on European Scene, is View

By CHESTER BLOOM
Telegram Washington Correspondent

Washington, D.C., Aug. 11—President Roosevelt's statement at his press conference Tuesday afternoon that he would be meeting Prime Minister Churchill, now in Canada, placed beside the conferences Mr. Roosevelt has been having with his post-war planning experts, undoubtedly gives a clue to the major topics to be discussed by the two leaders. What has happened is that the new war is moving so much faster than its 1914-18 first edition that management of enemy territories is leaps and bounds ahead of planning.

Thus both Britain and the United States have had to rush in civil administrators to North Africa and Sicily, provide emergency rations for the starving populace, and set up temporary controls without any authorizations from parliament or congress.

For example, eight teams of congressmen, non-partisan supporters of U.S. participation in a post-war world organization to enforce peace, are now touring the Middle West United States. They are trying to educate their countrymen in the need of American sharing of responsibility for preserving peace in Europe. They are urging a senate resolution with very laudable objectives.

RECOGNIZE ACTUALITIES

Two of these objectives are set forth as:

That the United States take the initiative in forming a world organization with authority:

To establish temporary administrations for Axis-controlled areas of the world as these are occupied by United Nations forces until such time as permanent governments can be established.

To administer relief and assistance in economic rehabilitation in territories of member nations needing such aid and in Axis territory occupied by United Nations forces.

The senate has not seen fit to even bring the topic up for discussion. Yet here are Britain and the United States, by force of circumstances, already in occupation of Axis territory in North Africa and Sicily, forced to give temporary relief, to set up temporary governments, to rehabilitate civil functions and put these countries on the way to helping themselves once more.

Obviously, Mr. Roosevelt and Mr. Churchill cannot wait for local politicians to settle, for example, what they think ought to be done in occupying Italy, establishing temporary governments there to maintain order and feed the populace. It may have to be done next week or the week after. And who can guarantee (by some long chance) that the same thing might not happen in France, in Belgium, in Holland—even in Germany within the next few months.

TERMS FOR ITALY

They must discuss also the question of terms for the beaten Italian government—undoubtedly proposals have been made and rejected—exactly what terms come under the heading of "unconditional surrender," or rather, what terms will be imposed under that heading. All sides must be agreed. Undoubtedly that was in Mr. Roosevelt's mind when he told his press conference that while he did not think the Russians would be participating in the conference with himself and Mr. Churchill, that did not mean they both would not be awfully glad to have them. At least the British and Americans must be agreed right down to the tiniest detail.

On that framework, the conference in Canada will proceed. That is why Mr. Roosevelt consulted all afternoon not only with all his military, naval and air force generals and advisers but also with his post-war advisers, Secretary of State Cordell Hull, Under Secretary of State Sumner Welles, Chairman Norman Davis of the Red Cross, Dr. Isaiah Bowman, Chief American Territorial Specialist at the Versailles Peace Conference in 1919, and Dr. Leo Pavolsky, special assistant secretary of state and specialist in post-war planning. Mr. Churchill and his staff unquestionably arrived in Canada with complete post-war plans of their own insofar as they apply to the governing of occupied territories. The Americans will present theirs, the plans will be threshed over, and unity arrived at for the final thrust home of the democratic daggers to the heart of the Axis.

Three Divisions

The rocks composing the earth's crust are grouped by geologists into three classes—igneous, sedimentary, and metamorphic.

Quebec, Aug. 11—The grim stone residence on Citadel Hill, summer home of Canada's Governors-General, to-day housed the Prime Ministers of Great Britain and Canada.

Rt. Hon. Winston Churchill and Rt. Hon. W. L. Mackenzie King went directly to Citadel Hill overlooking the St. Lawrence shortly after Mr. Churchill's arrival here yesterday.

One of the most storied spots in Canada, Citadel Hill was first fortified by Samuel de Champlain in 1608 as a place where settlers of the young colony could rush to safety from Indian raids. It is the highest hill in Quebec City and overlooks Dufferin Terrace and Chateau Frontenac.

Around 1928 the Citadel residence was rebuilt and thoroughly modernized and became the summer residence of Lord Willingdon, then Governor-General.

Since the Citadel was rebuilt it has been occupied each summer by the Governor-General. During the royal tour King George and Queen Elizabeth stayed there.

It is a commodious residence of more than 30 rooms and thoroughly modern.

GOOD TO COME OF BIG MEETING SAYS MORRISON

Conferences in Canada Will Also Mean New Trouble For Hitler, Cheering Workers Told

Barrow-In-Furness, England, Aug. 11—Home Secretary Herbert Morrison to-day told workers of the Vickers-Armstrong Company they can be sure that good will come out of the visit to Canada of Prime Minister Churchill.

"It is necessary that a conference should be held between us who are so closely engaged in the military operations now taking place," he said. "It is no less vital that closest consultation should take place between us and the Soviet Government.

"I am sure Hitler at this moment is saying, 'I wonder what those rascals are up to now? What new trouble is to rend?'"

He added, amid cheers, "There will be new trouble for him all right."

Mr. Morrison said that the German Air Force may still make a substantial attack on Britain "some night, somewhere, if it takes the risk and has not been defeated."

The German Army is still powerful, he said, and it is necessary to maintain production at a high level to achieve victory.

The minister assured his listeners that "we will settle with Japan all right," even though that country has not yet felt the full power of the Allied might.

Bishop Uses Airplane

Dr. L. H. Gwynne, 80, of Cairo, Bishop of Egypt and the Sudan, visits his diocese by plane instead of the steamer and camel of his early days. Thousands of troops have met "the flying bishop." Recently the armed services and laity gave him $4,000 on his birthday.

London, Aug. 11—Creation of a new military command "even more comprehensive than the combined command in the Mediterranean" for the military tasks on the European mainland may be one of the tasks before Prime Minister Churchill and President Roosevelt, the Times suggested to-day.

The reasons for Mr. Churchill's crossing the Atlantic "are written large and clear across the war fronts of the world," the Times said. "The Allies have gained so much during the summer that even the widest and most far-sighted plans are in danger of being outdated by events."

It remains to be seen whether the "faster pace and military tasks which await the western Allies on the European mainland will lead to establishment of a united active command even more comprehensive than the combined command in the Mediterranean," the Times' diplomatic correspondent wrote.

WANT RUSSIA THERE

Other press comment was:

Daily Herald—It hoped the conference would bring the Allies' political strategy "up to date" and added "the time has come when Britain, America and Russia should be announcing with a single voice their program for restoration of political liberty to Europe."

Daily Telegraph—The chief object of the talks would be to "review Anglo-American war strategy in the light of the breakdown of the Fascist regime in Italy and in view of the probability of the early collapse of Italian resistance."

News Chronicle—The conference was the "direct outcome" of the sudden downfall of Mussolini and the collapse of Fascism. It quoted authoritative quarters as suggesting that invasion forces were already two to three months ahead of schedule.

Daily Sketch—"This time it is a fair and easy guess that the principal item on the agenda will be the question of Italy."

SHIPPING BIG PROBLEM

Those who anticipate an attack against the European mainland from Great Britain pointed to increased sabotage reported by Belgian guerillas and the fact that Lord Leathers, Minister of Transport, was a member of Mr. Churchill's party. The presence of Lord Leathers in any parleys on war strategy, they said, emphasized the importance of the shipping question, which is vital in any offensive operations against Europe.

Their forthcoming conference was first discussed between Prime Minister Churchill and President Roosevelt in a trans-Atlantic telephone conversation 10 days ago, the Telegraph said.

The paper said Mr. Churchill hurriedly summoned his war cabinet in the early morning hours. At the time this raised speculation as to whether Italy's Marshal Badoglio had sent a peace offer.

Churchill, during a luncheon at Buckingham Palace Aug. 3, received the formal permission of the King to leave Britain.

20 TONGUES TOLD NEWS

The Prime Minister's last public appearance before his departure for Quebec was in the House of Commons Aug. 4.

The news of the Prime Minister's trip was broadcast by the BBC in 20 languages.

The Moscow radio broadcast early to-day a simple announcement of the Prime Minister's arrival in Canada, adding that he and President Roosevelt would meet "to discuss military questions."

COUNTY NEWS

Says 100 Bushels Potatoes Thrown On Oshawa Dump

Were Fit for Food, Alderman Declares — Bread and Meat Pies Also Said Discarded

Oshawa, Aug. 11 (Special)—Charges that 75 to 100 bushels of potatoes were thrown on the city dump were made by Ald. E. E. Bathe before the City Council at its meeting here last night.

He made his declaration in urging that the city dump be cleaned up. Ald. Bathe stated that three weeks prior to the appearance of the decaying potatoes on the dump, that they were perfectly sound and fit for food.

Ald. Clifford Harman gave evidence of other food waste and stated that on a recent visit to the city refuse dump he had seen "loaves of bread and meat pies thrown out in heaps."

The disclosures arose during discussion of an offer by a contracting firm now repairing city streets to completely cover the dump for $3,000, thus rendering it completely sanitary. No action was taken on the offer.

Pin ball machines were outlawed by council by the adoption of a by-law, similar to one recently enacted at Cornwall, which was upheld in the courts and found to be "air tight."

Opposition to the by-law came from Ald. Hayden Macdonald, wholesale tobacconist, who claimed that adoption of the by-law would work a hardship on many merchants in whose stores the games have been played "for amusement" and with no payoff in money.

His Worship pointed out that adoption of the new by-law would practically eliminate the pinball machine from the city. This despite the fact that at one time more than $2,500 was collected annually by the city through a licensing by-law.

RETAINED GOODS GIVEN REMAND FOR ONE WEEK

Dunbarton Man Claims D.I.L. Goods in Cottage When He Moved in Last April—Had Matches, Fined $67

Whitby, Aug. 11 (Special)—Pleading guilty to retaining goods in his possession knowing them to be stolen, J. F. Reid, of Dunbarton, was remanded one week for sentence in Whitby police court yesterday by Magistrate William Keith of Toronto.

The remand was ordered when Lieut. K. E. B. Jones, officer of the Canadian Corps of Commissioners

J. R. G. SUTHERLAND

REPORT HERO OF LEONFORTE IS WOUNDED

Major J. R. Gordon Sutherland, Limehouse, Took Part in Grimmest of Sicilian Battles—Aged 32

Georgetown, Aug. 11 (Special)—Major J. R. Gordon Sutherland who recently took part in one of Sicily's grimmest battles during the fall of Leonforte to the British, leading his men into battle to assist Captain Rowan Coleman's company to fight their way into the ridge overlooking the town, has been reported as wounded in Sicily.

Word came to his wife, who lives at their farm near Limehouse just a few miles from Georgetown. Major Sutherland is with the Princess Pats and was commended for his bravery through the Canadian Press war correspondent, Ross Munro, on July 30.

Major Sutherland, 32-year-old son of Dr. J. G. Sutherland and the late Mrs. Sutherland, was born in St. Catharines but moved to Limehouse about twenty years ago, and began his military career at Georgetown High School, where he was interested in the cadets, and upon graduation from Ontario Agricultural College, Guelph, and McGill University a year later, entered his military career in earnest. He was stationed on the west coast with the Canadian Army for about five years, returning to his home at Limehouse, where he

GOLF "PRO" NOW IN RCAF SAID MISSING

Sgt. Cecil Sinclair, Thornhill, Is Casualty, Parents Informed — Was at Uplands and Big Cedar Golf Clubs

Thornhill, Aug. 11 (Staff Special)—Failing to return from an operational flight during Allied concentrated bombing attacks over Germany's Ruhr Valley in June, Sergeant Cecil H. Sinclair, RCAF, is officially reported as missing, his parents, Mr. and Mrs. Charles Sinclair, of Thornhill, have been notified.

Enlisting in the RCAF in January, 1942, the young airman received his initial training at Swift Current and graduated as a wireless-air-gunner at Mossbank, Sask. In October of the same year he went overseas and was assigned to a bomber squadron. He had taken part in bombing raids on main German targets since that time.

Sgt. C. Sinclair

Widely known in golfing circles, Sergeant Sinclair was formerly an assistant professional at Uplands Golf Club and was professional at Big Cedar Point, Lake Simcoe. Prior to his enlistment, he was an employe of Burt Business Forms, Limited, Toronto.

Born at Stayner, Ont., he came to Thornhill as a small boy with his parents. He received his education at Langstaff Public School and Richmond Hill High School.

According to a letter received this week by Mrs. Sinclair, the pilot in Sergeant Sinclair's plane had been taken prisoner in Germany. Word reaching the pilot's mother through the medium of the International Red Cross told of how the pilot had suffered a broken leg and later taken prisoner.

Besides his parents, Sergeant Sinclair has a brother, Pte. Donald Sinclair, of the RCE, stationed at Nanaimo, B.C., and two sisters, Helen and Lorraine.

Father "Wings" His Son

A real father and son act, as pictured above, proved the highlight of a recent wings parade at No. 13 Service Flying Training School, RCAF, St. Hubert, Quebec, when L.A.C. J. S. McConnell received his wings from his father, Capt. James McConnell, of the Canadian Army. The McConnell's home address is Centre Road, Port Credit.

Milk And Broth Disappear As Bomb Blast Hits House

Orangeville, Aug. 11 (Special)—Mrs. George Large, of Orangeville, has received a letter from her brother, Mr. Ernest Harding, of Clapton, London, England, in which he gives a vivid description of an air raid he and his family went through.

A passage of the letter reads as follows: "I must tell you that we had a few air raids. We had two warnings on the 19th of May and then we had another one, so we came downstairs to the kitchen. It was about 3 a.m. My wife said: 'Shall we have something to drink?' So she made me a cup of oxo and I was sitting in my armchair sipping away while she was in the scullery getting two glasses of milk, when all of a sudden a plane dived and dropped a bomb about 30 yards away.

"We received the force of the blast. I was knocked out of my chair across the kitchen and my wife, who had covered the baby with her body, was shot up the passageway, milk and all. We don't know where the milk and oxo went. The ceiling came down, the doors were blown in and windows all blown out, but, thank goodness, none of us was hurt.

"The bombing killed one person, injured about 40 and damaged over 400 houses. We spent two days cleaning up the mess, and are now waiting for the builder to come and repair the damage, which amounts to £139. We now have two tarpaulins for a roof, so you can guess what it looks like around here with no windows and the openings blocked up with different patterns of lino."

Housing Shortage Hits Church Mice So Cassock Used

Rockwood, Aug. 11 (Special)—Rockwood residents have discovered that the housing shortage is apparently hitting mice—even the proverbial church mice.

Keith Hamilton, member of St. John's Church of England here, put his hand in the pocket of his cassock during the service and found a family of six mice, who had made a home for themselves there.

KING, ONT., COW MAKES RECORD IN MILK YIELD

Susie Korndyke Fayne Lass Has Given 208,744 Pounds in Lifetime — Is Owned by Eaton Hall Farm

Brantford, Aug. 11 (Special)—A new Canadian record for life-time production of milk, over all breeds, has been set by Susie Korndyke Fayne Lass, purebred Holstein owned by Eaton Hall Farm, King, Ont., the head office of the Holstein-Friesian Association of Canada announced here. The previous Canadian champion, and still world champion for butterfat, is Springbank Snow Countess, owned by T. R. Dent, Woodstock, with 9,062 pounds of butterfat from 207,050 pounds of milk in ten lactations. The Countess' image, in bronze, stands alongside No. 2 Highway, near Woodstock.

Susie Korndyke Fayne Lass has deposed the Countess as milk queen. Susie has given enough milk to supply any Canadian family with two quarts of milk daily for 114 years or two pounds of butter weekly for 82 years.

208,744 POUNDS

In eight lactations, on official record of performance tests supervised by the Federal Department of Agriculture, Susie has produced a total of 208,744 pounds of milk, containing 6,879 pounds of butterfat. Snow Countess still retains her butterfat title by a large margin.

Susie Korndyke Fayne Lass has been milked three times daily during all but her first yearly test period, when she was milked twice daily. For seven consecutive years "this grand old cow has had an average yearly production of 915 pounds of butterfat and 27,875 pounds of milk," the head office here reported. In addition to her life-time championship, Susie holds numerous other Canadian production records. She is the champion for both milk and butterfat for five, six, seven and eight lactations on three times a day milking.

Her latest yearly record of 924 pounds of butterfat from 28,227 pounds of milk, made as a 12-year-old, has been beaten only once in Canada by a cow of that age or older.

PRIZE AT C.N.E.

Susie's conformation won her the second prize for aged cow at the Canadian National Exhibition in 1934. Classified in selective registration at the advanced age of 12 years, she was still good enough to receive an official grade of "very good."

She was born on the farm of Christopher Cox, Bowmanville. Cox sold her to Eaton Hall Farm when she was four years old and she has made all but one of her yearly tests there. She is due to calve again shortly and, as she is in excellent health, should be good for another record, cattle experts state. She is the dam of Eaton Hall Fayne Chieftain, All-Canadian and reserve All-American 3-year-old bull for 1942, and Archie Muir, Courtivem, Ont., and

Claim Georgetown Dump Breeds Hundreds Of Rats

Flyer In Africa

HAROLD TUGWELL, of the RCAF, former resident of the Fairbank and Mt. Dennis areas of York Township, has been serving in Africa since May. Son of Mr. and Mrs. F. Tugwell, he was educated at Duncan B. Hood and Vaughan Road Collegiate. He enlisted in Toronto.

Suggest Bounty on Dead Rodents — Committee to Investigate Drains After Complaints

Georgetown, Aug 11 (Special) — The Pied Piper would be a welcome visitor in Georgetown at the present time.

That is the opinion of councillors who sat at the monthly meeting of town council last night, discussing the problem of destroying the hundreds of rats that cover the garbage disposal dump and pester the surrounding homes, as well as the merchants down town.

It was decided to impress the garbage collector once again of his responsibility of keeping the dump tidy, following complaints of the untidy way of throwing in the garbage. It was stated that the new fence built around the lot had improved the appearance considerably, but the method for destroying rats was quite a problem, and had been for many years. A bounty for dead rats was suggested, but the possibility of spreading disease through this system was also discussed. Chloride of lime, recently used on the dump, has had the tendency to chase the rats indoors.

PROBE DRAINS

Permission was given the roads committee to commence work on the main roads to investigate the condition of the drainage system. It was stated that there seemed to be an overflow at the north part of the main business section and a plugged drain further down causing small floods in the store cellars after every rainfall, as well as an unpleasant odor in the district. Mayor Joseph Gibbons expressed regret at the necessity of breaking up the good cement on the main street roads, but councillors found no other solution.

The newly appointed night constable, C. J. Fordyce, was granted an increase in salary from $25 weekly to $30, with eight hours nightly to be worked, and one night off each week. Councillors expressed their views that police protection should be given earlier in the evening.

S. P. Chapman, local druggist, presented a petition from a good percentage of local merchants, to change the half-holiday from Thursday, which has been observed for well over 20 years, to Wednesday, as is observed in all nearby towns. This was held over for further consideration until the September meeting.

INSPECTS STREETS

Councillor Kenneth McDonald will head the committee for another inspection of town streets next week with the purpose of clearing up all necessary repairs and additions to streets and properties before the fall frost sets in.

Councillors will extend their cordial invitation and welcome to the 88th Co. Veteran Guards of Toronto to spend Labor Day week-end in Georgetown and will put the local park at their disposal. Canadian National Institute for the Blind was granted permission to hold a tag day in town on September 25.

ROAD REPAIRS INCREASE TAX IN ESQUESING

Township Council Strikes Rate at 26.1, Up 1.3 Mills Over Last Year's Levy — Floods Caused Damage

Stewarttown, Aug. 11 (Special)—Esquesing Township Council struck the tax rate for 1943 at 26.1, an increase of 1.3 mills, at its regular monthly meeting.

This increase is necessary, councillors stated, on account of unforeseen expenditures on county roads of some $15,000 during the past year. The largest expenditure was on the ninth line, Glen Williams, where the road was completely washed out by the spring floods.

It is estimated that approximately $24,000 will be spent during the coming year on road repairs. The works program includes the changing of the course of the Credit River at Glen Williams village, to insure protection to the ninth line road, which has been rebuilt; also repairs on two bridges which were wrecked last spring, and other repairs throughout the county.

Grants to the agricultural societies of the township and county included: Acton, $75; Esquesing, $75, and Halton, $25.

Nursing Group Meets

Hespeler, Aug. 11 (Special)—The District Nursing Association met at the home of Mrs. J. R. Brethour. Miss Isobel Leeth, who has been serving as district nurse and who has resigned to take a course at the university, was guest of honor and was presented with a gift.

THIS PAGE IS DECLASSIFIED IAW EO 13526

at Ajax, was unable to give the court the exact value of the goods, which had been stolen from Defense Industries, Limited.

MARKED "D.I.L."

The goods, found in Reid's home when police raided the residence, included 60 pairs of canvas gloves, two pairs of rubber gloves, two pairs of special acid-resisting gloves, five pairs of steel scissors, two pairs of copper brillium scissors, eight locks, twine, a set of special measures and other articles. Most of these bore special D.I.L. identification marks or were special quality goods such as the copper brillium scissors made specially for use in the D.I.L. plant.

Reid claimed that the merchandise was in the cottage when he moved in in April and that he hadn't bothered to report his discovery to the police.

"You did the worst thing you could have done," Magistrate Keith admonished him. "You should have notified the police immediately and possibly they might have apprehended the thief. War industries are suffering a great deal from this sort of thing."

CARRIED MATCHES—FINED $67

Two D.I.L. employes, one at the plant for a week and the other for over two years, were each convicted of having matches in their possession on plant premises. They were Alan Tomlinson, of Claremont, and John A. Young, of R.R. 1, Locust Hill. Both were fined $50 and costs, a total of $67.

Tomlinson, with D.I.L. one week, stated that he had not previously worn the suit in which one match was found to work and did not know it was in his pocket. Young, with the company two years, stated that he searched himself on getting off the bus, before punching in but must have missed the six matches found on him. He claimed his record with the company was without a black mark.

months, being called back to the army eight months previous to the outbreak of war.

He was then stationed at Esquimalt, B.C., until going overseas at Christmas of 1939. He was attached to headquarters staff at London, England, for some time but joined his men in the field shortly before the invasion of Sicily.

Major Sutherland married the former Kathleen Yeates, of London, Ontario, about seven years ago. They have one son and one daughter, the latter the father has not seen yet, being born a few months after his arrival in England. An only brother, Col. J. L. Sutherland, who was overseas for some time, is now on active service out at the west Canadian coast.

Lockjaw Victim, 16, Buried At Weston

Orangeville, Aug. 11 (Special)—Orangeville relatives and friends attended the funeral yesterday afternoon of Lenora Roseen Sparrow, of Weston, who died on Sunday, August 8, from lockjaw. Deceased, who was 16 years old, had been employed at the C.C.M. plant in Weston.

Surviving are her parents Mr. and Mrs. H. G. Sparrow, of Weston; six sisters, Miss Kathleen Sparrow, Mrs. Isabel Saunsbury, Mrs Grace Ure, of Toronto; Miss Dorothy Sparrow, of Long Branch; Mrs Olive Bolton, of London, and Mrs Hazel Pierson, of Weston; and two brothers, Messrs. Thomas and Herbert Sparrow, of Weston.

Thomas S. Hewson, of Orangeville, is grandfather of the deceased, and Mrs. A. S. McGowan, Orangeville, an aunt.

The funeral was held from Ward's Funeral Home at 4 o'clock. Interment was made in Weston Cemetery.

sponsorship of Depot 1, Scarboro Red Cross Society. It was attended by over 1,000 persons.

Music was provided by Rus. Creighton's Orchestra, and games were played in nearby Heather Rink. The dance was opened by Deputy Reeve Alan P. Wheler, and Reid Hoover was convener of the committee in charge of arrangements.

Noreen Price, of Malvern, won a $50 war bond as first prize in a lucky draw. Other prize-winners were: Margaret Armstrong, Wexford; B. W. Hexham, Toronto; Clark Denby, Milliken; Robert Gray, Agincourt, and Mrs. Roy Ward, Agincourt. Waverly Wilson won first prize, and Edward Cosburn second prize for selling the most tickets.

The proceeds will be used to send Christmas boxes to the men and women on active service who lived in the area comprising Depot 1 before they enlisted.

Man From Tennessee At Dundalk Reunion

Dundalk, Aug. 11 (Special)—H. B. McInnis, Hanover, was elected president of the Robinson-McMillen clan in annual re-union at Community Memorial Park here and Mrs. Lily Perry, Bethel, secretary-treasurer.

Seventy members of the family connection attended from various parts of Ontario. Sports, supper and a program were enjoyed.

Prizes were awarded to the following: Oldest lady, Mrs. David McMillen, Proton, 85; oldest man, Thos. R. Bailie, Dundalk, 89; youngest infant, Sandra Tanner, Etobicoke; most recent bride and groom, Mr. and Mrs. Earl Robinson, Toronto; lady coming greatest distance, Mrs. L. L. Leffler, State of Arkansas; man coming greatest distance, Mr. England, State of Tennessee.

It was decided that next year's re-union would be held at Dundalk.

agricultural circles, ... Wellington st., Aurora, died yesterday in York County Hospital, Newmarket. He was 97.

Born in King Township at Love's Corners, now known as Temperanceville, he was the son of early pioneer settlers in the district. He was educated in one of King Township's first schools and received secondary education at Newmarket High School.

For 12 years he taught school at Glenville and Snowball, later entering the employ of Fleury Implement Works, Aurora; the site of which is now occupied by the Royal Canadian Ordnance Corps.

In 1876 he married Mary Rank of King Township, who predeceased him several years ago. At the age of 49 he was appointed as magistrate of York County and nine years later, a notary public. Until 1905 he was secretary-treasurer of both high and public schools, also serving as secretary of Aurora Cemetery Company. He was a member of the United Church and of the Masonic Order.

Surviving are two daughters, Lois, at home; Mrs. F. D. Thornloe, Lansing, and a son, Frank, of Winnipeg.

£2 Site For School Bought 100 Years Ago

Elders' Mills, Aug. 11 (Staff Special)—One hundred years ago today Richard Jeffery sold to the trustees of S.S. No. 15, a parcel of land for two pounds, upon which the first school in this historic community was erected.

To mark the event, a formal celebration will be held on Sept. 4, at which time trustees, former pupils and teachers from many parts of the province are expected to be present.

The original school site is situated about 15 miles north of Toronto on Highway 27.

GEORGETOWN FLYER GETS COMMISSION

Parents Think Heroism in Air Battle Hastened Promotion

Georgetown, Aug. 11 (Special)—Sergeant Leslie M. Clark, RAF, son of Mr. and Mrs. Mark Clark, of Georgetown, who recently survived a fierce air battle against three enemy Junkers while en route to Africa with the Air Transport Command, has been commissioned as pilot officer.

L. M. Clark

Word was received by his parents recently and they are of the opinion that this triumphant battle hurried this promotion along. Clark's Beaufort plane was piloted by F. O. E. Hall, of St. James, Manitoba, and in spite of severe damages, including wrecked hydraulics, turret put out of action, gasoline tank and transmitter put out of action, and the explosion of a cannon shell in the machine, which just missed Clark's head, the boys managed to return to a British base.

Les enlisted in June of 1941 and trained at Manning Pool Depot, Toronto, and at Guelph, where he trained as a wireless gunner, then at Jarvis, where he graduated, standing fourth in his class in May of 1942; then to Dorval where he was posted to the Transport Command and went overseas shortly after this posting.

Leslie has served in England, Gibraltar, Cairo and the Belgian Congo.

Dorothea Marshall Wed To R. Horsely

Horning's Mills United Church Wedding Scene

Horning's Mills, Aug. 11 (Special)—Horning's Mills United Church was the scene of the wedding of Dorothea Winnifred, daughter of Mr. and Mrs. W. B. Marshall, Horning's Mills, and Mr. William Richard Harold Horsley, of St. Catharines, son of Mr. and Mrs. Ross Horsley, Horning's Mills. Rev. Edward M. Burgess performed the ceremony.

Given away by her father, the bride wore a gown of white faille taffeta fashioned with softly gathered skirt and train, sweetheart neckline and trimmed with matching frilling. Her floor-length English net veil fell from a Queen Anne style headdress and she carried red roses and bouvardia.

Mrs. T. McEachern, of Collingwood, was her cousin's matron of honor; Miss Mary Belcher, of Toronto, another cousin, was bridesmaid, and Miss Beth Marshall was her sister's junior bridesmaid. Kenneth Horsley, the groom's brother, was best man, and ushers were Glenn Marshall and Harvey Ward, of St. Catharines.

At the reception held after the ceremony at the home of the bride's parents, Mrs. Marshall received and the groom's mother assisted.

For the wedding trip through Muskoka the bride chose a pink silk jersey dress with black accessories. Mr. and Mrs. Horsley will live in St. Catharines.

Victory Garden Show To Be Held In Weston

Weston, Aug. 11 (Staff Special)—Victory gardeners in Weston are being given the opportunity of seeing their produce in competition, although Weston Horticultural Society has cancelled its regular fall show on account of "unsettled conditions."

Directors of the society, in cancelling the main competition, have made arrangements to carry on the children's section and to award victory garden prizes. The show will be held early next month, it was announced to-day.

Married In Oshawa

MR. and MRS. J. ROWLAND DOYLE, who were married in St. Andrew's United Church, Oshawa. Mrs. Doyle was formerly Edith Joyce McDiarmid, daughter of Mr. and Mrs. J. Howard McDiarmid, of Oshawa, formerly of Toronto, while Mr. Doyle is a son of Mr. and Mrs. Bernard Doyle, of Toronto.

August Bridals

Violet Judge Weds Airman

L.A.C. Harold Nelson Groom At Rhodes Ave. Church Ceremony

The marriage took place in Rhodes Ave. United Church, of Violet Janet youngest daughter of Mrs. Daniel Judge and the late Mr. Judge, to Leading Aircraftman Harold J. Nelson, youngest son of Mr. and Mrs. Charles Nelson. Baskets of red and white gladioli and palms formed the setting for the ceremony and Rev. Morrison Sellers officiated. Miss Dorothy Allan, niece of the bride, sang "Because," during the signing of the register. The wedding music was played by Mr. F. H. Redwood.

The bride, given in marriage by her brother, Pte. Daniel Judge, RCOC, was lovely in a floor length gown of white silk Jersey on long torso lines with shirred trimming, full length veil of tulle illusion, caught to her head with a heart-shaped halo of shirred net and orange blossoms. She carried a cascade bouquet of white gladioli petals slightly shaded with coral gladioli and fern.

The bride's attendants, Mrs. G. Christensen, as matron of honor, wore a floor length dress of rose pink faconne over taffeta, blue taffeta hat with pink birdcage style veil and blue gloves, and carried a cascade bouquet of pink gladioli with touches of blue cornflowers. The two bridesmaids, sisters of the bride, Mrs. Robert Allan and Mrs. Andrew Sneddon, were dressed alike in floor-length gowns of queen's blue faconne sheer in leaf design over pink satin. Their hats were pink taffeta shirred double-brimmed design with soft blue veiling birdcage style, pink gloves and they carried cascade bouquets of pink gladioli. All three attendants wore strings of pearls, gifts of the bride.

Mr. Gordon Salter, brother-in-law of the groom, was best man and the ushers were Mr. Robert Judge, brother of the bride, and Mr. Charles Nelson Jr., brother of the groom.

The reception was held at the YWCA, 1150 Gerrard st. east, where the mother of the bride received the guests wearing a royal aster purple crepe dress with large matching hat and a corsage of pale yellow and white roses with bouvardia. She was assisted by the mother of the groom, wearing a flamingo blue crepe dress, bead trimmed and matching hat and wearing a corsage of pink roses and bouvardia.

The couple left later for an extended motor trip. The bride chose for travelling a dove grey two-piece velvet ensemble, tri-colored hat with touches of mauve, black suede shoes and bag and carried stone martin furs. They will live in Toronto.

Out-of-town guests were Mr. Chas. Nelson Jr., from Montreal; Mrs. A. Purves, Hamilton; and Mr. and Mrs. Robt. Judge and baby daughter, Donna, from Ottawa.

A.T.S. Girls Arrive Here

More Recruits To Train For British Army Washington Posts

Another group of 11 A.T.S. recruits arrived at the C.W.A.C. Trinity Barracks yesterday to take their training before proceeding to Washington, D.C., where they will be attached to the British Army staff as clerical workers.

The eleven girls flew from the Barbadoes to Miami, where they were met by Subaltern Carter of the A.T.S., who accompanied them to Toronto. At No. 102 Depot Company, Trinity Barracks, they will be outfitted with C.W.A.C. uniforms, which will be slightly altered to comply with A.T.S. regulations, and in a few days will report to No. 3 C.W.A.C. Basic Training Centre at Kitchener for their initial military training.

"You Canadians all seem to think our accents are funny, but you have accents too, and they sound just as funny to us," said Doreen Payne of the Barbadoes. Miss Payne was born in the Barbadoes and is of English stock. She has three brothers and three sisters in the West Indies and one brother attending McGill University in Montreal.

Lucille Fraser, who taught in a convent previous to being enlisted in the Auxiliary Territorial Service, is happy to be in Toronto to see her mother, who lives on Madison avenue. Lucille has never been outside

Wartime Prices Board Rapped For Raising Costs

Wounded In Sicily

PTE. WILLIAM ROBERT STEWART, son of Mrs. H. Stewart, of Fairbank, has been wounded in action. He is one of three brothers serving in the Canadian Army.

CANUCKS 'LOVE' TOUGH BATTLES WITH GERMANS

"Sorely Need Consumer Representation," Says Con. Saunders, Citing Charges for Vegetables

Bitter criticism was levelled at the Consumers' Branch of the Wartime Prices and Trade Board to-day at the Board of Control meeting by Controller Robert Saunders who stated that as a result of his investigations into prices charged for vegetables in Toronto this year he has "absolutely no faith in Consumers' Branch."

The controller said that the branch did nothing as far as he could see to rectify a disgraceful situation in regard to potatoes and onions until the committee appointed by the Board of Control had started its investigation.

"We sorely need consumer representation in this city," he said, "for no sooner does the producer ask for high prices than the Wartime Prices Board grants the request. I refer now to the fact that the berry growers recently asked for and received 12 cents a pint. "We now have in this city a board which is setting minimum as well as maximum prices."

Controller Saunders gave the

THREE EVENTS NEAR FINALS IN BOWLING

Provincial Tourney Play Continues in Ontario and Toronto Trophy Competitions at Local Clubs

Winners will be decided in three events at the Ontario provincial lawn bowling tournament at Toronto to-day while more than 120 entrants are set to begin the doubles play this afternoon.

J. Smith, of London Elmwoods, will meet N. Robinson, of West Toronto, for the Eaton Gold Trophy, and W. H. Downey, of Windsor, plays A. A. Carmichael, of Toronto St. Matthew's, for the Henry Trophy. Play early to-day brought the consolation tourney to the final round, F. Templeton, of Weston, and R. Taylor, of Toronto Kew Beach, meeting for the trophy.

Templeton downed W. S. Cameron, of West Toronto, 17-10, and Taylor overcame Dr. R. Sendker, of Buffalo, 14-9, in the semi-finals. Ontario Trophy play advanced to the third round this morning and two rounds of the Toronto Trophy were completed.

Results:

ONTARIO TROPHY

Third round—Dr. Walker, Hamilton Argyles 17, J. C. Burns, Markham, 9; A. Atkinson, Ottawa, 14, A. Mackenzie, Toronto Kew Beach, 13; M. Booth, Cobourg, 15, H. Gardner, Toronto Moore Park, 14; E. Cartwright, Toronto Boulevard, 7, F. Adsey, Toronto Fairmount Park, 21; D. E. Blein, Buffalo, 15, R. Auld, Niagara Falls, N.Y., 6; J. Prescott, Toronto Coburn Park, 12, H. E. Randall, Toronto Lawrence Park, 17; A. E. Salisbury, Toronto Kew Beach, 16, D. Howard, Hamilton Roselawn, 13; Dr. W. Krupp, Woodstock, 15, E. Shea, Toronto St. Matthews, 12.

TORONTO TROPHY

First round—A. E. Marrin, Niagara Falls, N.Y., 10, J. Burgess, Toronto Kodak, 16; D. Brown, Hamilton Roselawn, 14; T. Mawson, Toronto Glebe Manor, 18; H. McLaren, Detroit, 18, Major Robinson, Toronto Withrow, 8; T. Raney, Toronto High Park, 12, J. W. Gooch, Toronto Lawrence Park, 16; A. A. Langford, London Thistles, 9, A. Ward, Detroit, 13; D. Dakers, American Lawn Bowling Association, 10, N. Irving, Toronto Victoria, 13; K. B. McKellar, Toronto Boulevard, 11, E. Pound, Toronto Canadas, 9; H. W. Blackburn, Glebe Manor, won by default.

GROUP OF A.T.S. GIRLS ARRIVE

Pictured above are nine of the eleven A.T.S. recruits who arrived at Trinity Barracks, C.W.A.C., yesterday, from Barbadoes in the British West Indies. Left to right, front row: Dorothy Gooderich, Hilda Gill, Lucille Gill, Joan Gooding and Peggy Gooding; back row: Betty Farmer, Daphne Leach, Lucille Fraser and Doreen Payne. —(Telegram Staff Photo)

A.T.S. Girls Arrive Here

More Recruits To Train For British Army Washington Posts

Another group of 11 A.T.S. recruits arrived at the C.W.A.C. Trinity Barracks yesterday to take their training before proceeding to Washington, D.C., where they will be attached to the British Army staff as clerical workers.

The eleven girls flew from the Barbadoes to Miami, where they were met by Subaltern Carter of the A.T.S., who accompanied them to Toronto. At No. 102 Depot Company, Trinity Barracks, they will be outfitted with C.W.A.C. uniforms, which will be slightly altered to comply with A.T.S. regulations, and in a few days will report to No. 3 C.W.A.C. Basic Training Centre at Kitchener for their initial military training.

"You Canadians all seem to think our accents are funny, but you have accents too, and they sound just as funny to us," said Dorren Payne of the Barbadoes. Miss Payne was born in the Barbadoes and is of English stock. She has three brothers and three sisters in the West Indies and one brother attending McGill University in Montreal.

Lucille Fraser, who taught in a convent previous to being enlisted in the Auxiliary Territorial Service, is happy to be in Toronto to see her mother, who lives on Madison avenue. Lucille has never been outside

Wartime Prices Board Rapped For Raising Costs

Wounded In Sicily

PTE. WILLIAM ROBERT STEWART, son of Mrs. H. Stewart, of Fairbank, has been wounded in action. He is one of three brothers serving in the Canadian Army.

CANUCKS 'LOVE' TOUGH BATTLES WITH GERMANS

"Sorely Need Consumer Representation," Says Con. Saunders, Citing Charges for Vegetables

Bitter criticism was levelled at the Consumers' Branch of the Wartime Prices and Trade Board to-day at the Board of Control meeting by Controller Robert Saunders who stated that as a result of his investigations into prices charged for vegetables in Toronto this year he has "absolutely no faith in Consumers' Branch."

The controller said that the branch did nothing as far as he could see to rectify a disgraceful situation in regard to potatoes and onions until the committee appointed by the Board of Control had started its investigation.

"We sorely need consumer representation in this city," he said, "for no sooner does the producer ask for high prices than the Wartime Prices Board grants the request. I refer now to the fact that the berry growers recently asked for and received 12 cents a pint. "We now have in this city a board which is setting minimum as well as maximum prices."

Controller Saunders gave the

THREE EVENTS NEAR FINALS IN BOWLING

Provincial Tourney Play Continues in Ontario and Toronto Trophy Competitions at Local Clubs

Winners will be decided in three events at the Ontario provincial lawn bowling tournament at Toronto to-day while more than 120 entrants are set to begin the doubles play this afternoon.

J. Smith, of London Elmwoods, will meet N. Robinson, of West Toronto, for the Eaton Gold Trophy, and W. H. Downey, of Windsor, plays A. A. Carmichael, of Toronto St. Matthew's, for the Henry Trophy. Play early to-day brought the consolation tourney to the final round, F. Templeton, of Weston, and R. Taylor, of Toronto Kew Beach, meeting for the trophy.

Templeton downed W. S. Cameron, of West Toronto, 17-10, and Taylor overcame Dr. R. Sendker, of Buffalo, 14-9, in the semi-finals. Ontario Trophy play advanced to the third round this morning and two rounds of the Toronto Trophy were completed.

Results:

ONTARIO TROPHY

Third round—Dr. Walker, Hamilton Argyles 17, J. C. Burns, Markham, 9; A. Atkinson, Ottawa, 14, A. Mackenzie, Toronto Kew Beach, 19; M. Booth, Cobourg, 15, H. Gardner, Toronto Moore Park, 14; E. Cartwright, Toronto Boulevard, 7, F. Adsey, Toronto Fairmount Park, 21; D. E. Blein, Buffalo, 15, R. Auld, Niagara Falls, N.Y., 6; J. Prescott, Toronto Coburn Park, 12, H. E. Randall, Toronto Lawrence Park, 17; A. E. Salisbury, Toronto Kew Beach, 16, D. Howard, Hamilton Roselawn, 13; Dr. W. Krupp, Woodstock, 15, E. Shea, Toronto St. Matthews, 12.

TORONTO TROPHY

First round—A. E. Marrin, Niagara Falls, N.Y., 10, J. Burgess, Toronto Kodak, 16; D. Brown, Hamilton Roselawn, 14; T. Mawson, Toronto Glebe Manor, 18; H. McLaren, Detroit, 18, Major Robinson, Toronto Withrow, 8; T. Raney, Toronto High Park, 12, J. W. Gooch, Toronto Lawrence Park, 16; A. A. Langford, London Thistles, 9, A. Ward, Detroit, 13; D. Dakers, American Lawn Bowling Association, 10, N. Irving, Toronto Victoria, 13; K. B. McKellar, Toronto Boulevard, 11, E. Pound, Toronto Canadas, 9; H. W. Blackburn, Glebe Manor, won by default.

Second round—J. Burgess, Toronto Kodak, 18, T. Mawson, Toronto Glebe Manor, 8; H. McLaren, Detroit, 11, J. W. Gooch, Toronto Lawrence Park, 10; A. Ward, Detroit, 12, H. Irving, Toronto Victoria, 10; K. B. McKellar, Toronto Boulevard, 13, H. W. Blackburn, Toronto Glebe Manor, 11; C. Renaud, Peterboro, 21, G. M. Crosby, Toronto Monarch Park, 22; C. Bell, Lindsay, won by default; T. Huntley, Toronto Kew Beach, 13, A. Smith, Toronto Monarch Park, 11; R. S. Merifield, Toronto Moore Park, 8, B. Ward, Whitby, 16.

CONSOLATION

Quarter-finals—W. S. Cameron, West Toronto, 13, H. Paul, Detroit, 11; F. Templeman, Weston, won by default; R. Taylor, Toronto Kew Beach, 17, H. Campbell, Buffalo, 11; Dr. R. Sendker, Buffalo, won by default.

Semi-finals—W. S. Cameron, West Toronto, 10, F. Templeman, Weston, 17; R. Taylor, Toronto Kew Beach, 14, Dr. R. Sendker, Buffalo, 9.

Praises RCAF Personnel For Work Fighting Fires

Wounded

LIEUT. F. D. (BOB) HANDLEY, 48th Highlanders, has been wounded in action, according to word received by his wife at 110 Courtleigh boulevard. He enlisted in March, 1940, and went overseas in August of the same year. He attended Elm House School, Upper Canada College and the University of Toronto.

CHANGE OR END FREEZE ORDER TEACHERS ASK

Undue Suffering Declared Caused by Ottawa Move—Early B.N.A. Amendments Urged to Guarantee Freedoms

Saint John, N.B., Aug. 11—Delegates to the annual convention of the Canadian Teachers' Federation today unanimously adopted a resolution urging the federal government to amend or repeal the order-in-council which last June froze school teachrs in their profession.

The delegates sent copies of the resolution to Prime Minister Mackenzie King and to Labor Minister Mitchell. They asked that Mr. Mitchell agree to meet representatives of the federation.

Delegates said that the order-in-council had caused undue suffering to some teachers.

URGES B.N.A. CHANGES

Earlier the convention heard the report of Dr. E. F. Willoughby of Winnipeg, chairman of the federation's reconstruction committee.

The report said that "freedom from want and freedom from fear" are not contained within the framework of Canada's present constitution. Before all the legislation which is necessary to guarantee these freedoms to our citizens can be passed," it said, "amendments to the British North America Act will undoubtedly be necessary." It urged early action on such amendments.

ONLY AID SOURCE

Wing Cmdr. H. R. Low, of Ottawa, director of educational services, RCAF, told the federation yesterday that teachers must look

Airwoman and 10 Flyers Receive Letters for Acting Promptly in Emergencies

Ottawa, Aug. 11—Ten airmen and one airwoman serving with the RCAF overseas and in Canada have received letters of commendation from Air Marshal L. S. Breadner, Chief of Air Staff, it was announced here today.

Addressed personally, the letters expressed Air Marshal Breadner's "personal appreciation for the courage and resourcefulness which you displayed and for the fine example you have set for all ranks of the Royal Canadian Air Force."

Sgt. Doris Duncan of Ottawa won commendation for her "presence of mind and devotion to duty when a fire broke out suddenly in a tender which was being refuelled." Sgt. Duncan instructed the driver to move the tender off, while she ran into the pump house and turned off the gasoline pumps, averting an explosion in the gasoline tanks.

TURNED FIREFIGHTER

The day after the incident in which Sgt. Duncan was involved, L.A.C. Walter Melvin of Webb, Sask., was working on a refuelling tender overseas, when fire broke out. He drove his truck away from the tanks and returned to fight the flames with a fire extinguisher until the fire department arrived on the scene. Melvin's parents, Mr. and Mrs. J. S. Melvin, live at Webb, Sask.

Sgt. Martin M. Meinczinger, of Magrath, Alta., earned commendation for his "exceptional coolness and devotion to duty" displayed during a night navigation exercise at an operational training school overseas. The crew was forced to bail out of the aircraft, but Meinczinger noticed that two of the men were having difficulty, and he stayed in the plane until they were safely out after he had assisted them.

TORONTO MAN PRAISED

Eight airmen who subdued a fire which broke out in a hangar, endangering RCAF and Royal Norwegian Air Force aircraft were commended in letters from Air Marshal Breadner.

They were: Sgt. John S. Hoye, of Vancouver; Flt.-Sgt. Richard W. Joy, of Fort William; L.A.C. Arthur D. Crouch, of 3212 Danforth ave., Toronto; L.A.C. Richard W. Rands, of 103 Hiawatha rd., Toronto; A.C.1 George M. Cummings, of Sudbury; L.A.C. Ernest G. Anderson, of 44 Lanark ave., Toronto; A.C.1 John J. Healey, of 403 Montrose ave., Toronto; and A.C.1 Harry Dubrofsky, of Montreal.

ZOOT SUITERS RAID DANCE IN MONTREAL

City and Military Police Disperse Hoodlums But No Arrests Made

Montreal, Aug. 11 (Special)—One

Miss Marguerite Cahill was quietly married to Flying Officer Kenneth C. Young, RCAF, Rev. Father C. E. Combe officiating.

The bride was given in marriage by her brother-in-law, Mr. Ogden Hershaw, and attended as matron of honor by her sister, Mrs. Ogden Hershaw. Flying Officer Ralph Johnson was best man for the groom.

The bride is the daughter of Michel Cahill and Mrs. Cahill of Montreal, and the groom is the son of the Rev. Charles Young and Dr. Young; of Melbourne, Australia.

The young couple will take up temporary residence at Montreal.

ASHLEY—MOORE

The marriage took place in Victoria, British Columbia, with Rev. Albert Hall officiating, of Mary Margaret Elizabeth (Betty) Moore, daughter of Mr. and Mrs. John A. Moore, to Harold Wilbert Ashley, son of Mr. and Mrs. W. Ashley, of Long Branch. Mrs. J. Coverdale played the wedding music.

The brid was given in marriage by Mr. Donald Darley and wore a blue sheer street-length dress with matching hat and bouquet of roses, sweet peas and fern. Mrs. Kimberley C. Jones was her attendant wearing blue silk crepe, matching hat and corsage of pink carnations, sweet peas and fern. Mr. Kimberley C. Jones was groomsman.

The reception was held at the Glen Shield Hotel, after which the couple left for Shawinigan Lake, B.C., the bride travelling in a blue suit with navy blue accessories.

McLAUGHLIN—HALL

Westminster United Church, Weston, was the setting for the wedding of Ann S. D. (Nan) Hall, daughter of Mr. and Mrs. Thomas M. Hall to Norman B. McLaughlin, son of Mrs. McLaughlin and the late Mr. George McLaughlin. Rev. K. J. Joblin officiated.

The bride wore a gown of pale pink silk jersey with matching hat and shoulder length veil and a corsage of red roses. Miss Margaret Hall was her sister's attendant wearing pale blue silk jersey with matching hat and veil and corsage of red roses. Mr. Howard J. Price was the groomsman.

Following a reception at the home of the bride's parents the couple left for Eastern Ontario, the bride travelling in a blue crepe suit with brown accessories. They will live in Weston.

COOK—ROE

A quiet wedding took place when Mina Isdelle Roe, Reg. N., youngest daughter of Mr. and Mrs. Thos. J. Roe of Bolton, was married to Norman Alexander Cook, son of Mrs. Cook and the late Samuel Cook of Sandhill. The ceremony was performed by Rev. T. W. W. Lane of Toronto.

The bride, who was unattended, wore a frock of mist blue crepe, corsage of roses and small fuchsia-colored hat. Following a honeymoon in Northern Ontario the couple will live in Toronto.

PEARSON—WEIR

At the United Church in Port Credit the wedding of Edythe, daughter of Mr. and Mrs. Carson B. Weir, Toronto, to John O. E. Pearson, son of Mr. and Mrs. F. J. Pearson, Owen Sound, was solemnized by Rev. Stanley Osborne.

The bride wore a tropical suit in neutral tone. Her accessories were gold and chocolate brown, and she wore a corsage of yellow roses. She was attended by her sister, Peggy in turquoise with corsage of Talisman roses. Mr. R. J. Macauley, Owen Sound, was groomsman.

A reception followed at the home of the bride's parents. Upon their return from the Laurentians the couple will make their home in Lakeview, Ontario.

son, Miss E. M. Petett, Mr. Geo. Smith, Mr. Ray Stapley, Miss Elizabeth J. Stewart, Miss Katherine B Warnock, Mr. and Mrs. A. G. Watts and daughter, Miss M. F. Satterly, Mr. and Mrs. C. D. Devlin, Mrs. W. E. Bakshaw and daughter, Miss Joyce Warnock, all of Toronto; Mr. and Mrs. W. W. Currie, Hamilton; F.O. Alan Edwards, RAF, Mount Hope; Mr. and Mrs. R. D. Fraser, Miss Margaret Griffin, Mr. and Mrs. H. C. Hayhow, Miss R. Hayes, Hamilton; F.O. Wm. Morgan, RAF, Mount Hope, Hamilton; Mr. R. Hugh Feasley, Mr. C. J. Martin, Mr. and Mrs. A. Wallis, St. Catharines; Miss L. C. Craig, Gp. Cpt. and Mrs. V. S. J. Millard, Mrs. F. G. Robertson, Ottawa; Mr. and Mrs. J. Kelton, Windsor; Mr. and Mrs. Mac Hayes, Weston; Mr. and Mrs. F. Pounsett and family, Leaside; Mr. Harry Wiffen, Oakville; Lt. J. MacLean, Hull Que.; Mr. and Mrs. W. J. Moore, Brantford; F.L. and Mrs. Wm. O Brown, Oshawa; Miss Lois Clemens, Niagara Falls; Mr. Allen Ashwell, Mr. Nelson Cameron, Mr. Earl Siegrist, London; Mr. J. Parks, St. Thomas; Mr. Mark Berry, Port Stanley; F.O. and Mrs. A. Walter, Port Dover; Miss Margare Ayers, Detroit; Mr. and Mrs. R. P. Crawford, Mr. and Mrs. Adrian Collins and daughter, Erie, Pa.; Mr. and Mrs. Chas. Clark, Kenmore, N.Y.; Miss Judith Dickinson, Washington, D.C.; Mr. and Mrs. Harry Siegel, Milford, Mich.; Miss Olive Finley, Chevy Chase, Maryland; Mr. and Mrs. V. C. Tyrrell, Mr. and Mrs. G. E. Hotton, Kenmore, N.Y.; Mr. and Mrs. W. K. Francis, Mrs. Selma S. Jones, Niagara Falls, N.Y.; Mr. and Mrs. Jos. Henke, Mr. Frank S. Tautia, Mr. and Mrs. Robt. Mueller, Mr. Gerry Loveridge, Mr. and Mrs. Thos. Jewers, Detroit; Mr. and Mrs. Chas. Sweeney, Mr. and Mrs. Edwin Maull, Mr. Wm. G. Ringle, Mr. and Mrs. Donald Mitchell, Mr. August Konefal, Buffalo.

the Barbadoes. "I've heard so much about Canadian winters I am truly sorry that I will not be here when the winter begins. I've never seen snow in my life. It's very hot at home but we noticed the heat much more in Miami, due to the dampness of the air," she said. Her brother is the captain of a British rescue ship which is used for the purpose of rescuing survivors from the sea.

There are two sets of sisters among the girls, Hilda and Lucille Gill and Joan and Peggy Gooding, all stenographers. The Gooding sisters have a brother serving in the RAF.

WIGWASSAN LODGE

Guests registered at Wigwassan Lodge, Lake Rosseau, Muskoka, this week-end included: Mrs. N. J. Ratcliff, Miss Eileen Ratcliff, Mr. and Mrs. Malcolm Todd, Messrs. Percy and Alfred Corking, Mr. K. F. Budd, Mr. and Mrs. J. Finlay, Mrs. K. Bateman, Miss Kimble, Mrs. E. R. Brisley, Mr. and Mrs. E. Lumley, Mr. and Mrs. J. E. Lumley, Jr.; Mr. and Mrs. T. H. Hunt, F.O. W. Martin, Miss Marjorie Hunt, Mrs. A. Whelan and son, Miss Eleanor King, Misses Dorothy and Marjorie Hamilton, Miss Beryl Stewart, Miss Shirley Whiting, Miss Lucile Montreuil, Mr. and Mrs. S. A. Scott, Mr. and Mrs. Wm. Weir, Miss Helen O'Loane, Toronto; Misses Florence and Reta Schill, Miss Marguerite Keating, Kitchener; Miss Effie McCluskey, Hamilton; Miss Margaret Fletcher, Miss Dorothy Warren, Miss Marion Birchard, Windsor; Miss Eileen Deacon, Kingsville.

Mrs. John MacLean, Miss Isabel L. Steel, Bay Village, Ohio; Miss Ruth Buck, Mr. and Mrs. Wm. C. Uhl, Miss Maxine Styer, Cleveland, Ohio; Miss Alice Tourt, Lakewood, Ohio; Mr. and Mrs. D. B. Clark, Baltimore, Md.; Mr. and Mrs. R. S. Whitman, Washington, D.C.; Miss Kay MacDonnell, Miss Mary E. Reaume, Mrs. K. J. MacDonnell.

TAKES ENGLISH BRIDE

Mr. and Mrs. Ralph Rothwell who were married in London, England. The bride was Miss Elena Cox, only daughter of Mr. and Mrs. W. G. Cox, London, England, and the groom, who is a driver in the RCASC, is the eldest son of Mr. and Mrs. W. Rothwell, Harlett ave., Toronto.

Tame Fighting Italians But Huns Slug It Out, They Say — Nazis Hate Our Artillery

By HAROLD V. BOYLE
Associated Press War Correspondent

With the Canadian 1st Division in Northern Sicily, Aug. 7—(Delayed)—Those battle-hungry Canadians who complained of the tameness of the Sicilian campaign in the early stages because the Italians wouldn't fight, have run up against a tough German force in slugging mountain warfare—and they love it.

"Yes, Jerry is our main enemy," said Gunner George Hamilton of Guelph, Ont. "As soon as he is licked the war is over and the more we knock out here the easier it will be on the mainland."

The group, who said the "only thing we want is a spaghetti dinner and a bottle of beer," declared that the only way in the last two weeks they could get the Germans was to blast them out of the rocks and that the Nazi troops learned to "hate our artillery."

"We have been firing 25-pounders, 150 to 200 rounds per gun every day and every night," one of the group said.

"Our artillery has been perfect—we fired 4,400 pounds from each gun in one barrage," said Gunner Elmer Caldwell of Finelatter, Sask. "Nothing can take that." Our artillery barrages have been so heavy our infantry finds some Germans clenching machine guns—still alive but so shell-shocked they are unable to move."

EXPECT APPROVAL RAILWAY PAY RAISE

Increase of Eight Cents an Hour Agreed On to Be Submitted to FDR

Washington, Aug. 11 — Labor circles heard to-day that the 15 non-operating railroad unions in the United States have completed a contract with the carriers providing for the full 8-cent hourly increase recommended by an emergency board and that the agreement will be submitted directly to President Roosevelt for approval.

Union and railroad spokesmen reached an understanding last Saturday, but President Roosevelt's absence from the capital precluded an immediate presentation of the contract to him.

Railroad labor men expressed confidence Mr. Roosevelt would approve.

The unions originally asked for a 20-cent increase and a minimum wage of 70 cents an hour. The Emergency Board estimated the 8-cent increase would add $204,000,000 a year to the railroads' payrolls.

42 Inoculated

At five free Toronto toxoid clinics yesterday 42 inoculations against diphtheria were given, 17 receiving the first, 14 the second and 11 the third treatments.

Board of Control the tonnage of potatoes in cold or common storage in Canada at March 1, 1943, as being 134,805 as against 92,000 tons for 1942.

"On May 1, this year, we had 60,974 tons in storage while on the same date last year there were 44,568 tons," he said. "On June 1 of this year there were 24,861 tons in storage, but only 11,003 for June last year. These are figures from the Bureau of Statistics at Ottawa, and it is beyond me to reason out how the Wartime Prices Board claims that there is no hoarding or shortage to the consumer."

Referring to onions, Controller Saunders said that in Ontario storage on March 1, this year, there were 5,514 tons, but on the same date last year there were only 977 tons.

"We all know of the destruction of onions this year, and I would also like to know what the Consumers Branch was doing about this conditions at the time," he said.

Permission was given Controller Saunders to reply to a letter from J. L. Ilsley, Minister of Finance, in which the Minister said he was of the opinion the Board of Control is not adequately informed in regard to existing consumer representation in the W.P.T.B.

Ask Police Aid In Hunt For Toronto Boy Of 15

Police have been asked to assist in the search for David Marshall, aged 15, of 546½ Queen street west, who has been missing from his home since March 26th.

The youngster is described as weighing 125 pounds and has a small scar on the left side of his neck. He has blond hair and blue eyes. When last seen he was dressed in a green checked suit, black shoes and no hat.

Nova Scotia Visitor Lands 660-Pound Tuna

Wedgeport, N.S., Aug. 11—A two-hour and 39-minute struggle off this south shore fishing community won Samuel Sharap, of Granville, N.Y., the distinction yesterday of being the first United States visitor this summer to land a fighting bluefin. The tuna weighed 660 pounds.

A second one he caught topped the scales at 500 pounds. He said he would sell them for the benefit of the Red Cross.

Loses Life In Sicily

PTE. HAROLD CHILVERS, 30, son of Mrs. and the late William Chilvers, 20 Mould street, lost his life in Sicily on July 18, according to word reaching his mother yesterday. He had been overseas more than three years with the 48th Highlanders of Toronto, having enlisted shortly after war was declared. Pte. Chilvers is survived by his mother and four brothers, William, Alfred, Fred and John. He attended Kent School and was well known in the Runnymede district.

Three Kitchener Men and Galt Woman Plead Guilty of Infraction of Wartime Rules

Kitchener, Aug. 11 (Special) — Pleading guilty to infractions of the oil controller's regulations, a Galt woman and three Kitchener residents were fined a total of $95 and costs when they appeared before Magistrate H. R. Polson yesterday.

Albert Becker, a service station operator, was fined $50 and costs on a charge of accepting coupons detached from a gas coupon book.

Edward Hammer and Armand Forget, both of Kitchener, were assessed $10 and costs each on charge of having loose coupons. Ruth Dargel of Galt was fined $25, including costs, on a similar charge.

The disparity in the fines imposed on Hammer and Forget and Miss Dargel was explained by Magistrate Polson by saying that some of the coupons in the Galt woman's possession were for a commercial vehicle.

STRIP BARS SITES ALONG ALASKA ROAD

Government Establishes Mile-Wide Reservation on Each Side Highway

Edmonton, Aug. 11—Canada had established a reservation of one mile in depth on each side of the Alaska highway to prevent premature "grabbing" of sites for townsite or private business purposes, R. K. Odell of Ottawa, said here on return from a tour of the 1,500-mile route.

Mr. Odell, assistant director of the North Pacific Planning Project, said the road now is a military highway and will serve as such for the duration of the war and six months after.

The federal government has sent soil specialists, men from the forestry service of the Department of Mines and Resources and representatives of the parks branch to study resources of the area with a view to affecting a policy for future development. He explained these operations are matters of regular departmental functions.

Train Kills Man Gathering Coal

Tilbury, Aug. 11 (Special)—Henry Champagne, 73, of Tilbury, was killed instantly this morning when while gathering coal on the M.C.R tracks not far from his home, he was struck by a westbound passenger train.

The unfortunate man, who was stone deaf, evidently did not see the approach of the speeding train, or the screaching whistle of the locomotive which the engineer blew incessantly by way of warning.

Mr. Champagne, who is a widower and lived alone, had stepped on to the northbound track when a train headed east, appeared, and did not see the westbound flier approaching.

Rubber for Jar Rings

Ottawa, Aug. 11—Munitions Department officials said to-day that sufficient rubber had been made available in Canada to meet the needs for rubber jar rings used in home canning, and this policy was being continued.

Tame Fighting Italians But Huns Slug It Out, They Say — Nazis Hate Our Artillery

By HAROLD V. BOYLE
Associated Press War Correspondent

With the Canadian 1st Division in Northern Sicily, Aug. 7--(Delayed)—Those battle-hungry Canadians who complained of the tameness of the Sicilian campaign in the early stages because the Italians wouldn't fight, have run up against a tough German force in slugging mountain warfare—and they love it.

"Yes, Jerry is our main enemy," said Gunner George Hamilton of Guelph, Ont. "As soon as he is licked the war is over and the more we knock out here the easier it will be on the mainland."

The group, who said the "only thing we want is a spaghetti dinner and a bottle of beer," declared that the only way in the last two weeks they could get the Germans was to blast them out of the rocks and that the Nazi troops learned to "hate our artillery."

"We have been firing 25-pounders, 150 to 200 rounds per gun every day and every night," one of the group said.

"Our artillery has been perfect—we fired 4,400 pounds from each gun in one barrage," said Gunner Elmer Caldwell of Finelatter, Sask. "Nothing can take that." Our artillery barrages have been so heavy our infantry finds some Germans clenching machine guns—still alive but so shell-shocked they are unable to move."

EXPECT APPROVAL RAILWAY PAY RAISE

Increase of Eight Cents an Hour Agreed On to Be Submitted to FDR

Washington, Aug. 11 — Labor circles heard to-day that the 15 non-operating railroad unions in the United States have completed a contract with the carriers providing for the full 8-cent hourly increase recommended by an emergency board and that the agreement will be submitted directly to President Roosevelt for approval.

Union and railroad spokesmen reached an understanding last Saturday; but President Roosevelt's absence from the capital precluded an immediate presentation of the contract to him.

Railroad labor men expressed confidence Mr. Roosevelt would approve.

The unions originally asked for a 20-cent increase and a minimum wage of 70 cents an hour. The Emergency Board estimated the 8-cent increase would add $204,000,000 a year to the railroads' payrolls.

42 Inoculated

At five free Toronto toxoid clinics yesterday 42 inoculations against diphtheria were given, 17 receiving the first, 14 the second and 11 the third treatments.

Board of Control the tonnage of potatoes in cold or common storage in Canada at March 1, 1943, as being 134,805 as against 92,000 tons for 1942.

"On May 1, this year, we had 80,974 tons in storage while on the same date last year there were 44,568 tons," he said. "On June 1 of this year there were 24,861 tons in storage, but only 11,003 for June last year. These are figures from the Bureau of Statistics at Ottawa, and it is beyond me to reason out how the Wartime Prices Board claims that there is no hoarding or shortage to the consumer."

Referring to onions, Controller Saunders said that in Ontario storage on March 1, this year, there were 5,514 tons, but on the same date last year there were only 977 tons.

"We all know of the destruction of onions this year, and I would also like to know what the Consumers Branch was doing about this conditions at the time," he said.

Permission was given Controller Saunders to reply to a letter from J. L. Ilsley, Minister of Finance, in which the Minister said he was of the opinion the Board of Control is not adequately informed in regard to existing consumer representation in the W.P.T.B.

Ask Police Aid In Hunt For Toronto Boy Of 15

Police have been asked to assist in the search for David Marshall, aged 15, of 546½ Queen street west, who has been missing from his home since March 26th.

The youngster is described as weighing 125 pounds and has a small scar on the left side of his neck. He has blond hair and blue eyes. When last seen he was dressed in a green checked suit, black shoes and no hat.

Nova Scotia Visitor Lands 660-Pound Tuna

Wedgeport, N.S., Aug. 11—A two-hour and 39-minute struggle off this south shore fishing community won Samuel Sharap, of Granville, N.Y., the distinction yesterday of being the first United States visitor this summer to land a fighting bluefin. The tuna weighed 660 pounds.

A second one he caught topped the scales at 500 pounds. He said he would sell them for the benefit of the Red Cross.

Loses Life In Sicily

PTE. HAROLD CHILVERS, 30, son of Mrs. and the late William Chilvers, 20 Mould street, lost his life in Sicily on July 18, according to word reaching his mother yesterday. He had been overseas more than three years with the 48th Highlanders of Toronto, having enlisted shortly after war was declared. Pte. Chilvers is survived by his mother and four brothers, William, Alfred, Fred and John. He attended Kent School and was well known in the Runnymede district.

Three Kitchener Men and Galt Woman Plead Guilty of Infraction of Wartime Rules

Kitchener, Aug. 11 (Special) — Pleading guilty to infractions of the oil controller's regulations, a Galt woman and three Kitchener residents were fined a total of $95 and costs when they appeared before Magistrate H. R. Polson yesterday.

Albert Becker, a service station operator, was fined $50 and costs on a charge of accepting coupons detached from a gas coupon book.

Edward Hammer and Armand Forget, both of Kitchener, were assessed $10 and costs each on charge of having loose coupons. Ruth Dargel of Galt was fined $25, including costs, on a similar charge.

The disparity in the fines imposed on Hammer and Forget and Miss Dargel was explained by Magistrate Polson by saying that some of the coupons in the Galt woman's possession were for a commercial vehicle.

STRIP BARS SITES ALONG ALASKA ROAD

Government Establishes Mile-Wide Reservation on Each Side Highway

Edmonton, Aug. 11—Canada had established a reservation of one mile in depth on each side of the Alaska highway to prevent premature "grabbing" of sites for townsite or private business purposes, R. K. Odell of Ottawa, said here on return from a tour of the 1,500-mile route.

Mr. Odell, assistant director of the North Pacific Planning Project, said the road now is a military highway and will serve as such for the duration of the war and six months after.

The federal government has sent soil specialists, men from the forestry service of the Department of Mines and Resources and representatives of the parks branch to study resources of the area with a view to affecting a policy for future development. He explained these operations are matters of regular departmental functions.

Train Kills Man Gathering Coal

Tilbury, Aug. 11 (Special)—Henry Champagne, 73, of Tilbury, was killed instantly this morning when, while gathering coal on the M.C.R tracks not far from his home, he was struck by a westbound passenger train.

The unfortunate man, who was stone deaf, evidently did not see the approach of the speeding train, or the screaching whistle of the locomotive which the engineer blew incessantly by way of warning.

Mr. Champagne, who is a widower and lived alone, had stepped on to the northbound track when a train headed east, appeared, and did not see the westbound flier approaching.

Rubber for Jar Rings

Ottawa, Aug. 11—Munitions Department officials said to-day that sufficient rubber had been made available in Canada to meet the needs for rubber jar rings used in home canning, and this policy was being continued.

to the Dominion Government as their only additional source of financial assistance.

Wing Cmdr. Low said that provincial governments could not provide the necessary financial grants, but that money for improvements in salaries, school buildings and teacher training was necessary.

T. A. McMaster, director of the Canadian Legion educational services told of the work being done by the Canadian Legion and said that many British war prisoners were "having time to study almost for the first time in their lives" and that through the education services good use was being made of this extra time.

TO DUMP CONCRETE OUT OF NORMANDIE

Liner's Tilt Now Only 38.88 Degrees — Critical Stage Passed

New York, Aug. 11—The former French liner Normandie tilted at an angle of 38.88 degrees at 9 a.m. today, the smallest degree of list since righting operations began.

Capt. Bernard E. Manseau, the United States Navy's supervisor of salvage operations, said that when the vessel reached an angle of 37 degrees raising operations would be suspended temporarily to allow removal of tons of concrete which were poured into the ship in the early stages of repair work. Already derricks were being used to remove parts of the superstructure.

Navy Secretary Frank Knox, praising the Navy and civilian crews in a telegram, said that the critical stage of operation "is safely past."

The ship had a 79-degree list when mired in the Hudson River mud.

Flyer Finds Lost Car Sights It From Air

Brantford, Aug. 11 (Special) — W.O. 2 Stewart Skinner, an airman at the RCAF school at Burtch near here, reported to police that his car had been stolen and a few hours later, while making a flight he sighted it on a deserted road on Salter's Island. He directed police to the machine.

Sgt. John Rowcliffe found it with a radio and spare tire missing. Apparently an attempt had been made to remove other tires but the thieves had been disturbed at their work.

Wounded In Sicily

PTE. STEWART BEATTY, 48th Highlanders, has been wounded in action in Sicily. He enlisted in April, 1941, and went overseas in October the same year. He attended Silverthorn Public School. His parents, Mr. and Mrs. Robert Beatty, reside at 218 Eileen avenue.

woman was injured when zoot suiters again attempted to break up a community street dance in North End Montreal last night. Police reserves and military police who were held at the dance in readiness for trouble of the zoot suiters quickly broke up the brawl and the drape-coated trouble makers escaped without any arrest.

More than 1,000 people were gathered at the corner of Ogilvie and Champageur about 10 o'clock last night enjoying a dance arranged by the Park Extension Community Association when a car packed to the doors with zoot suiters raced to the scene. The new arrivals at once started a fracas with dancers, and soldiers in the crowd launched an attack against them. Mrs. Alice Kenworthy, 44, stopped a wild punch. She was treated for cut lips, but refused to go to hospital. When the raiders found police and military police charging on them they broke and fled.

This is the third time that a community street dance in the north end has been disrupted by zoot suiters in recent weeks and similar instances have occurred at open air dances in Verdun. Police are determined to stop the trouble.

DRIVER CREMATED IN CAB OF TRUCK

Spark From Passing Car Ignites Spilled Gasoline — 18 Persons Suffer Burns

Chicago, Aug. 11—The driver of a gasoline truck was trapped and cremated in his cab to-day and at least 18 passersby were burned when the truck crashed into a viaduct and the gasoline-covered street burst into flame.

Police identified the driver as William J. Bradley, 53, of suburban Midlothian. The 18 persons burned were spectators and would-be rescuers of the truck driver.

Police said the blast was caused by sparks from the exhaust of another car which ignited hundreds of gallons of gasoline which poured from the wrecked truck.

McIntyre May Get Agricultural Post

Report Middlesex Member to Be Minister

It was reported at Queen's Park to-day that Dan McIntyre, Progressive Conservative member-elect for South Middlesex, will be Minister of Agriculture in the Drew Cabinet.

Mr. McIntyre won a traditionally Liberal seat by a plurality of about 950 over C. M. Macfie, late Liberal member, with a C.C.F. candidate trailing.

A farmer and cattle buyer in Ekfrid Township for many years, he has stockyards in Appin and Chatham, and has served on the advisory committee of the Wartime Prices and Trade Board's food administration.

Coupons From 50,000 For Meat In Lockers

London, Ont., Aug. 11—W. Harold McPhillips, prices and supply representative here said to-day 50,000 Western Ontario residents have returned ration coupons to cover meat they have stored in lockers. Amounts stored ranges from 20 to 150 pounds.

FAILED TO HEED CALL OF ARMY PENALTY IS $50

Court Orders Accused Turned Over to Military — Had Been Given Three Deferments

("A" Court—Magistrate Browne, City Hall.)

Charged under National Selective Service regulations with failing to report for military training within the time limit, Julius Lostracco pleaded guilty and was fined $50 and costs or 30 days by Magistrate Browne.

James Butler, assistant divisional registrar and enforcement officer, stated that the accused was examined in June, 1942, and found fit for military training.

THREE DEFERMENTS

"He applied for and received a deferment until November. He made a second application which was granted until January this year and after that he was granted a third deferment until February this year. On June 12 he was notified to report for military training on June 21. This he failed to do," said Mr. Butler.

R. H. Greer, K.C., defense counsel, pointed out that Lostracco was in business and got the deferments to try and sell it. "He was not trying to escape," declared counsel.

"He was waiting for the war to be over," replied Magistrate Browne. His Worship ordered that the accused be turned over to the military authorities at once.

TEMPTATION TOO GREAT

Asked to explain why he took $270 from a downtown restaurant where he was employed on the night shift, Raymond Herrell said that the money was in a drawer and that the temptation was too great. He said he purchased a motor car with some of the money and went to Orillia. Accused, who has a record, was given six months.

For stealing four pairs of hose from a downtown store, Albert Moran, who pleaded guilty, was sentenced to 60 days.

Patrick Oliver, appearing for sentence on a charge of taking a motor car without consent of the owner, was given three months. His companions, R. Langlis and C. Hand, jointly charged, were given suspended sentence.

The court had been told that Oliver took the car and then picked up the other two and drove around.

PLEA FOR FINE FAILS

Up for sentence on a charge of carrying a revolver without a permit, Alton O'Brien, despite his plea to the court to impose a fine, was sent down for three months.

At a previous hearing Detective Ledlie stated that O'Brien went to the store operated by his wife, from whom he is separated, and while in the house pulled out a revolver and fired a shot at a dog which was barking in the back yard.

DICE GAME

Convicted of running a dice game in his home on Darling avenue, John Webber was fined $25 and costs or 14 days. Eight men found in

Ontario Wireless Air Gunner Grads At Jarvis

H. E. Hannestead, a Norwegian who escaped from his native country after the Nazi occupation, headed a class of Wireless Air Gunners graduating from No. 1 Bombing and Gunnery School, RCAF, at Jarvis, recently. A member of the Royal Norwegian Air Force, Hannestead carried the rank of Quartermaster, and like most Norwegians declined to reveal the manner in which he was able to leave his home and reach England in safety. The class also included another Norwegian, A. O. Kongness.

Wings were presented to the graduates by Group Captain A. D. Bell-Irving, Commanding Officer of the School. The class included eight from Ontario in addition to other Canadians and one member of the Royal Air Force from Birmingham, England.

The Ontario graduates, pictured above, are: Back row (left to right) R. L. McGraw, Brantford; G. Fraser, 269 St. Leonards avenue, Toronto; G. L. Gratton, Windsor, and J. R. Chambers, Fort William. Front row (left to right) E. W. Knight, 111 Edwin avenue, Toronto; L. R. Hanley, Glen Robertson; L. C. Dumbell, 18 Tichester road, Toronto; T. G. Coxford, Ottawa.

HEAR TWO MEN FROM COBOURG HURT IN SICILY

Pte. Elwood Hie and Pte. Robert Bennett Are Casualties, Next-of-Kin Informed — No Details

Cobourg, Aug. 11 (Special)—Pte. Elwood Hie, age 21, son of Mr. and Mrs. Ira Hie, of Cobourg, was killed on July 23 at Sicily, his wife was informed in a telegram from Ottawa yesterday. He is the first Cobourg boy to fall in the battle of Sicily. He is survived by his widow and a three-year-old daughter, Sharon, his parents and three sisters, Bernice, Eileen and Donna.

He was born and educated at Cobourg, and was prominent in church league hockey when a boy, playing for Trinity United Church. Joining the Hasting and Prince Edward Regiment at Picton in May of 1940, he went overseas in January of 1941. His father is a member of the Veterans' Guard at Quebec.

Word was received yesterday by his parents, Mr. and Mrs. Herbert Bennett, that their son, Robert was wounded in Sicily. No details were given as to the nature of his wounds.

Pte. Robert Bennett enlisted with the Midland Regiment a few weeks after war broke out and after doing guard duty at Trenton airport for his services in July, 1942, and was accepted for duty a few months later. He was assigned to National Defense Headquarters, where he has since served.

ACTIVE SERVICE

RAF Man Surprised To Find Originals Club Has Copies of Posters Published By His Newspaper In 1915—Rare Documents, Saved From Flames, Are Destined For Ottawa Archives

Posters reading "The Brilliant Canadians — Official", "Canadians Save Situation", "Canadians Re-take 4.7—Glorious Feat!" startled 22-year-old C. Stanley Mays, London, England, newspaperman, Leading Aircraftman of the Royal Air Force and now stationed at Manning Pool.

These placards, treasured by the Originals Club, were issued by the Westminster Gazette, the Evening Standard and the Pall Mall Gazette during the last war to describe the Canadians action at the Battle of Festubert when they re-captured their own guns after a brilliant charge against the enemy-held position.

Leading Aircraftman Mays is reporting the news of his discovery to his publishers, the Westminster Press Provincial Newspapers, Limited, London, England.

"I know it will mean a great deal to the directors to hear how much the members of the Originals Club treasure their 1915 posters," says

were each fined $5 or five days.

Morality Officers Cole and Simmonds said they visited the premises on July 28 and found the game in progress.

"The accused admitted being in charge. "We seized $6.75 and chips," said P.C. Cole.

To R. H. Greer, defense counsel, the officer admitted that it was a small game.

The money seized was given to The Evening Telegram British War Victims' Fund. "That is a good place for it," said Magistrate Browne.

Year For Car Theft

("B" Court—Magistrate Hanrahan.)

Joseph Antoszak was sent to jail for a year for theft of an auto from a lot in Brampton. He pleaded guilty. The car was owned by Elmer Morrison.

Accused said he had parked the car at Sunnyside and a tire was stolen from it while there.

Nicholas Kessler, charged with pointing a gun, was remanded to Aug. 17 for hearing. His bail was fixed at $1,000.

LEFT ACCIDENT SCENE

William Plenty pleaded guilty to failing to remain at the scene of an accident and was fined $25 and costs and his license to drive cancelled for 60 days. He also admitted careless driving and was fined a further $10 or 30 days.

Israel Churgin said that while riding a bicycle on Harbord street his wheel was struck by accused's car. "I was hurt and off work for four weeks," he said.

Plenty promised to compensate Churgin.

Howard Alexander was fined $25 and costs after an admission of careless driving. Horace Halman said that accused ran into his automobile from behind on Gerrard st. near Scarboro road.

Stole Rent Money

("C" Court—Magistrate Prentice, City Hall)

Arrested in Hamilton yesterday on a warrant charging her with theft of $60 from Mrs. Margaret Magill, last October, Irene Russell, alias Kathleen Burke, alias Ina Campbell, appeared before Magistrate Prentice and pleaded guilty to the offense.

Det. William McKay, who brought the woman back to the city, stated Mrs. Magill had reported to police she had given the accused $60 to pay the rent of her house last Oct. 6. Accused had absconded and was not heard of until her arrest by Hamilton authorities this week, the officer declared.

Stating there were other charges pending against accused from other parts of the province, that she wished to be heard in Toronto, and to which she intended to plead guilty, Crown Counsel Norman Borins asked the court for a remand in custody until Aug. 18, which was granted.

Jailed In Rings Theft

(County Police Court—Magistrate Woodliffe, County Buildings.)

Pleading guilty to theft of two rings valued at $460, Fred Harvey was sentenced to 60 days in jail by Magistrate Woodliffe. Frank Zahara, 22, who was convicted of receiving the rings, received a 30-day jail term.

Detective Walter Turner of York Township police, had previously testified that Harvey while employed by a mover, had taken the rings belonging to Mrs. Louis Greene. Zahara said he had sold the rings for $5, giving $2.50 to Harvey.

Detective Turner declared that both men had deserted the army a year ago, and had been using false registration cards. Magistrate Woodliffe fined Harvey and Zahara $50 each or 30 days for breach of the National Registration Act.

SUNDAY SALE

"We're guilty of delivering goods, but all drug stores have been delivering ice cream for 25 years," Murray Koffler, drug store operator, told Magistrate Woodliffe who fined him $10, plus costs, or 10 days, for selling newspapers, cigarettes, and an ice cream brick on Sunday, Aug. 1.

Benny Gould who had delivered the articles in a car, was fined $1, plus costs, or two days. Gould said he is a graduate druggist and had only put in time on Sunday at the store as a favor to another clerk. He said he was not being paid, and was filling in for the regular delivery boys who had failed to show up.

Constable Charles Burlington, of York Township police, said he had questioned Gould when he was delivering an order on Aug. 1 on Strathearn road. Witness declared the order was for $2.81 and included newspapers, six packages of cigarettes, and a brick of ice cream. "I observed the car of the accused making other deliveries as well," stated Constable Burlington.

a short time, he transferred to the Hastings and Prince Edward Regiment and went overseas in 1941. He was born in England and came over to Canada with his parents while a young boy. He was educated in Toronto and came to Cobourg about six years ago with his parents.

Led In Sicily Fight Lt. McKibbon Hurt

Picton Soldier is Reported as Wounded

Trenton, Aug. 11 (Special)—Word has been received by Mr. and Mrs. J. E. McKibbon, 124 Henry street, that their son, Lieut. Jack McKibbon of the Hastings and Prince Edward Regiment, has been wounded in the battle of Sicily. The extent of his injuries was not learned.

Lieut. McKibbon enlisted two years ago at the age of 18 and after graduating from Brockville Officers' Training Centre was posted to Brantford Basic Training Centre where after nine weeks he led his platoon to win drill competitions. He was recently mentioned by Ross Munro as one of those taking a leading part in the battle.

A brother of Lieut. McKibbon, Pilot Officer McKibbon of the RCAF, is stationed on the west coast and a sister, Jean Clunis McKibbon, is with the RCAF Headquarters, Ottawa. Lieut. McKibbon's father, who is collector of customs at this port, is a veteran of the Great War and was for some time a lieutenant in the Hastings and Prince Edward during this war until discharged because of a physical disability a few months ago.

Bulgars Leave Turkey Except Those Jailed

Istanbul, Turkey, Aug. 11 — All Bulgars in Turkey are being called home to take up arms, it was reliably reported here to-day.

These reports added that the Turkish police have taken a large number of undesirable Bulgarian citizens into custody during the past few days.

Mays.

"Probably, with the exception of the firm's files of the paper itself, these placards are the only remaining relics of the kind. It is doubtful if the firm itself has copies of them. They will have a valuable asset to the historical records of the firm in the set of pictures of the placards I am able to send through the generosity of The Evening Telegram," Mays continued.

Mr. William Chalkley, executive member of the club, who was a sergeant-major in the medical corps and went overseas with the First Canadian contingent in the last war, told Mays how the club had acquired the posters.

"They were brought over from the old country by Private Billy Devlin who served with the 15th Battalion, 48th Highlanders, and he gave them to us in 1922 when we opened the club on Jarvis street," Mr. Chalkley said.

The posters went safely through a fire about a year later, though they changed color. One member, Bill May, decided they were well worth saving so he cleaned them off with the only cleaning agent at hand, wads of fresh bread. When the new club opened on Yonge street the posters were hung in a place of honor.

"We've often been asked to loan them for display at exhibitions but they are such a treasure that we don't want to risk anything happening to them," Chalkley told Mays.

"If anything happens to the club they are destined for Government archives in Ottawa and we know they will be safe there."

The six posters, ranged around two sides of the walls of the club, although a little faded with age, are in a miraculous state of preservation considering the handling and the poor quality of newsprint during the last war.

T. JAMIESON

Andy Gillespie, serving in the Royal Canadian Navy, recently arrived overseas. During a visit to his uncle in Blantyre, Scotland, he met his cousin from Ninga, Man., whom he had not seen for 16 years. The cousin, Tommy Jamieson, is serving in the Royal Canadian Artillery.

Andy was born in Canada and went to live in Scotland. At the age of five he returned to Canada. Tommy Jamieson was born in Scotland and left there at the age of four. Since then the boys had not seen each other, Andy living in Toronto and Tommy in Manitoba. For the last three years Andy has been serving with the RCN. Tommy has been serving a year with the artillery.

Major Massey On Reserve

After eight months' service in the Canadian Army, Major Raymond Massey was to-day transferred to the inactive reserve because of ill health. He is resting at a Canadian resort following his discharge from a Montreal hospital.

Major Massey served from 1914 to 1918 in the Royal Canadian Artillery. He was wounded in 1916, and while convalescing he taught gunnery at Yale and Princeton as a member of the British Mission to the United States. He then served for a year in Siberia with the Canadian Army.

Major Massey again volunteered

C. A. Dunning's Son Missing

Flying Officer Avery Dunning, RCAF, son of one-time Finance Minister Charles A. Dunning, of Montreal, is missing after air operations overseas, it was learned last night. He is pictured above being congratulated by his father on the occasion of receiving his RCAF wings. F.O. Dunning graduated from Queen's University shortly before enlisting. He received his early education in Ottawa.

Arrives in Britain

PTE. NORMAN REYNOLDS, 22-year-old son of Mr. and Mrs. William Reynolds, 679 Strathmore blvd. and formerly of Greenbank, Ont., who has arrived safely overseas. He enlisted in March, 1941. His father served in the first World War with the 75th Battalion.

Badge Of Honor

Letters from Gen. Sir Bernard Montgomery and one of his divisional commanders revealed to-day that the gift of a group of Canadian workers has become the badge of honor of a hard-fighting team of the British 8th Army.

This year the staff of the inspection board of the United Kingdom and Canada, with headquarters in Ottawa, contributed toward the purchase of an anti-tank six-pounder gun of a type made in Canada.

Gen. Montgomery was advised of the gift to the 8th Army and there were sent to him brass plates to be attached to the gun, bearing a note that it had been presented by the inspection board employes.

Gen. Montgomery replied that the plates would be attached to an anti-tank gun of the 7th Armored Division of the 8th Army.

"This division is a veteran division and has fought in the western desert all through the campaign," he said. "In the final advance which began at Alamein in August, 1942, the division was the first into Tobruk, first into Benghazi, first into Tripoli and first into Tunis.

"So I have selected this division to have your brass plates."

The next letter came from Maj.-Gen. G. W. E. J. Erskine, commanding the 7th Armored Division.

"I have presented these plates to the officer commanding the 1-7th Battalion the Queen's Royal Regiment on your behalf. The plates now are carried by No. 5 gun team of No. 2 Troop of the anti-aircraft platoon of H.Q. Company of this battalion.

"I gave the honor of carrying these plates to this gun team because at the battle of Medenine on March 6 this battalion destroyed 27 German tanks with their six-pounder guns, and No. 5 gun team was itself responsible for the destruction of eight tanks."

"With best wishes, yours sincerely,
A. P. Wavell."

The YMCA is still active in Nazi-occupied Norway, and YMCA tea cars are right up in the front line of this war. They are rapidly becoming famous for their agility in reaching out-of-the-way places. One tea wagon in West Africa made a trip over impassable roads to serve men working in the jungle clearings and swamps to keep open the supply routes through which so many vital war materials flow. There are 1,000 tea cars in the United Kingdom, 50 in the Middle East, six in West Africa, two in Iceland and several in Greece, Crete and Singapore.

Five From Prince Edward Killed In Sicily Fighting

Ten From County Wounded in Invasion Battles—Hastings Has 2 Killed, 20 Wounded

Picton, Aug. 11 (Special)—Official reports of casualties in Sicily continue to be received daily here, with a total of five Prince Edward County men killed and ten wounded. All were members of Hastings and Prince Edward Regiment. From Hastings County, at least two have been killed and 20 wounded, all with the same unit.

Those from Prince Edward County killed in action are Cpl. Basil Rorabeck, C.S.M. Charles Nutley, Pte. Harold Lawson, Cpl. Charles Lloyd, all of Picton, and Pte. Gordon Leavitt, Bloomfield.

Wounded are Pte. Frank Franklin, Pte. Rex Shannon, Cpl. Oswald Milner, Sgt. Keith Sharpe, all of Picton; Pte. Kenneth Watkins, Cressy; Pte. Eric Mead, Bethel; Cpl. Ivan Johnson, Cherry Valley; Pte. Leonard VanCleaf, Wellington; Pte. Kenneth Bryant, Picton.

NOTED ATHLETES

Two of the casualties were well-known in sport circles. Pte. Rex Shannon, son of Mr. and Mrs. Patrick Shannon, wounded, was for a time catcher with Picton Intermediate O.B.A. team, all members of which enlisted and went overseas. Cpl. Rorabeck, killed in action, was a former Junior O.H.A. player and also starred in county hockey leagues. He was the elder son of Sgt. Arnold Rorabeck, RCAF, Mountain View, and Mrs. Rorabeck, Picton. He was born at Carleton Place 25 years ago and resided at Bloomfield before coming to Picton six years ago. He enlisted in September, 1939, and went overseas with the First Division. Besides his parents he is survived by a younger brother, Charles, and a sister, Mrs. Ernest Weaver.

MARKED BIRTHDAY

Pte. Gordon Leavitt was killed the day after he had marked his 35th birthday in Sicily, on July 22. He was born at East Lake and resided there until his marriage, when he moved to Bloomfield. He is survived by his wife, a young daughter, Fay; four brothers, Leighton, Howard and Clayton, of East Lake, and Orval, of Port Huron, Mich., and a sister, Mrs. Ray Preston, Wellington.

Cpl. Charles Lloyd was born at Salmon Point, Athol Township, and went overseas with his brother, C.S.M. Frank Lloyd, who recently returned to Canada and is now stationed at Three Rivers, Quebec. He is also survived by four sisters, Mrs. Albert Norman, Picton; Mrs. James Cory, Main Duck Island; Mrs. Stanley Rankin, Cherry Valley, and Mrs. Victor Morgan, Toronto.

C.S.M. Charles Nutley, son of Albert Nutley, Picton, was killed the first day of the Sicilian invasion, as was Pte. Harold Lawson, son of C.S.M. and Mrs. R. W. Lawson, Picton.

HAD BARBER SHOP

Pte. Frank Franklin, wounded, is one of three brothers in Sicily, the others being Ernest and Arthur. Frank was recently mentioned in news stories from Sicily when he set up a barber shop in the town of Assoro before it had been entirely rid of the enemy. His wife and his mother, Mrs. Herbert Franklin, reside here.

Pte. Kenneth Watkins, wounded, is the son of Donley Watkins, Cressy. He has a brother, George, overseas, and a sister, Ella, in the C.W.A.C. at Halifax.

Pte. Oswald Milner is a son of Arthur Milner, veteran of the last war, and Mrs. Milner. He went overseas in 1939.

Leonard VanCleaf, wounded, is the son of Mr. and Mrs. Norman Van Cleaf, Wellington, and was a member of the First Canadian Division.

Sgt. K. Sharpe, also wounded, is the son of Mr. and Mrs. Fred Sharpe and went overseas in July, 1940. His wife and family reside here.

Pte. Kenneth Bryant, a member of the local regiment, has also been wounded, a cable last night advised.

LOWER CEILING SEEN CUTTING LAMB SUPPLY

Lack of Delivery and Bigger Demand Also Adding to Scarcity — Promise More Before Week-End

Recent lowering of the ceiling price for dressed lamb, difficulties of delivery, and increased seasonal demand, are some of the reasons suggested by representative buyers and butchers for the scarcity of lamb in evidence last week and at present.

On July 27 the ceiling price of dressed lamb from wholesalers was reduced from 40-42 cents a pound to 30 cents. This means that the farmer instead of getting about 19 cents a pound, live weight, will be offered about 16 cents a pound. In addition, a further lowering of the ceiling price for dressed lamb to 22 cents a pound will go into effect on Sept. 1.

Because of the further reduction in prospect, a member of one packing concern, interviewed yesterday, doubted very much whether farmers were holding back their lambs from the market. At the same time, he mentioned the issuance of a government order last week which forbids the killing of any lamb under 75 pounds liveweight.

The purpose of this order, he explained, was to get more meat and to prevent lambs being sold earlier than they should.

But in actual practice, he said, no lambs came to the packers after Wednesday of any week. With the present demand for lamb being far in excess of the supply, all the lamb in butcher shops around the city was pretty well cleared out over the week-end.

"Consequently," he added, "in the first part of the week, there is bound to be a scarcity until lambs are bought, killed and distributed. For example, we are killing to-day but the meat can't be distributed until to-morrow." The marketing of lambs was, in his opinion, about normal, but the demand was twice as great.

"The butchers will all have lamb before the week is out," was his confident conclusion.

On the other hand, a representative of another concern engaged in selling dressed lamb, considered that, in consequence of the lowering of the ceiling, farmers were definitely holding back their lambs from the market.

Electorate Restive Under Regulations

Hon. J. A. McKinnon's View of By-election Results

Edmonton, Aug. 11—Results in the four Federal by-elections Monday, in which Liberal candidates were defeated, "are protest votes against ceilings on wages and farm prices, and the general war-time restrictions," Hon. James A. Mackinnon, Federal Minister of Trade and Commerce, said in an interview here.

"They are just the reaction to controls and restrictions in effect in Canada which, rightly or wrongly, the government considers necessary to the effective prosecution of the nation's war effort," he said.

Letting Building Get Too Cold No Fuel Saver

London, Ont., Aug. 11—L. E. Carrothers, superintendent of buildings for the London Board of Education, said to-day that drastic overnight cooling of school buildings during the winter, as suggested by Munitions Minister Howe yesterday, would result in increased coal consumption if carried too far.

SEES IN PICTURES WORLD LANGUAGE

Photos and Symbols Only Universal Means of Communication, Says Wells

New York, Aug. 11—Pursuit of world unity through creation of a universal language leads up a "blind alley," in the opinion of H. G. Wells. He foresees the next century possibly bringing an increase rather than a decrease in the number of spoken languages.

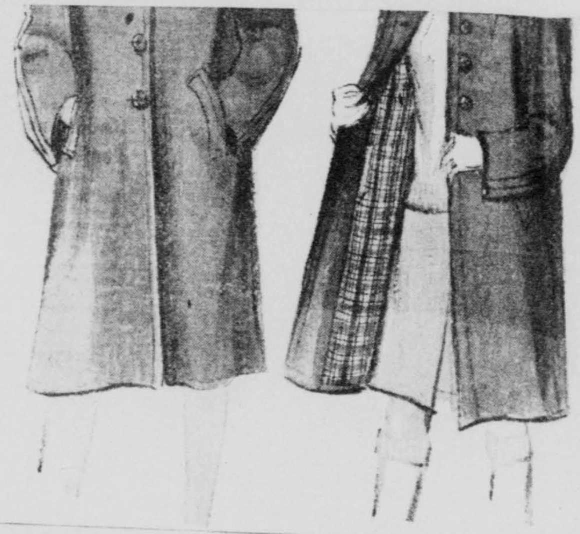
However, universal communication may be achieved, Wells sets forth in a copyrighted article appearing in the current issue of the Saturday Review of Literature, by the use of photograph to reproduce symbols, diagrams and pictures, and by use of "pigeon" speech in which would be amassed the basic words from many tongues.

"There is scarcely a fact spoken language can express which cannot be conveyed a thousand times as rapidly and completely through the eye," writes Wells. "When we hear talk of re-educating the whole world for unity, the speaker must either have this new visual education in mind or he must be an impracticable wishful thinker or altogether insincere."

"Basic languages" consist of the minimum vocabularies required to talk understandably in any tongue and these, Wells thinks, would be far more suitable for spreading ideas than a newly created universal language.

Stamford Airman Killed Overseas

Parents Have Two Other Sons In Active Service



Niagara Falls, Ont., Aug. 11 (Special)—Mr. and Mrs. Frank H. Hill, Stamford Centre, received a cable from the War Office advising that their son, Sergeant-Pilot William Grant Hill, 25, of the Royal Canadian Air Force, was killed on active service overseas. He received his wings in January, 1943, and went overseas two months later.

Besides his parents, he leaves his wife, Mrs. Mamie Woodbury Hill, 681 Third avenue; a sister, Miss Annie Hill of Kitchener, and three brothers, Jack Hill of Hamilton, Gunner Arthur Hill, overseas, and Leading Stoker Bac Hill of the Royal Canadian Navy.

Yanks Keep Improving

Jersey City, N.J., Aug. 11—Yank soldiers now are being issued waterproof wax-coated matches that will not melt unless the temperature goes higher than 160 degrees, shoelaces that won't mildew in jungle humidity, and khaki-colored gum wrappers that blend with the ground when discarded. Old type gum wrappers left tell-tale white marks for an enemy aviator.

LOWER CEILING SEEN CUTTING LAMB SUPPLY

Lack of Delivery and Bigger Demand Also Adding to Scarcity — Promise More Before Week-End

Recent lowering of the ceiling price for dressed lamb, difficulties of delivery, and increased seasonal demand, are some of the reasons suggested by representative buyers and butchers for the scarcity of lamb in evidence last week and at present.

On July 27 the ceiling price of dressed lamb from wholesalers was reduced from 40-42 cents a pound to 30 cents. This means that the farmer instead of getting about 19 cents a pound, live weight, will be offered about 16 cents a pound. In addition, a further lowering of the ceiling price for dressed lamb to 22 cents a pound will go into effect on Sept. 1.

Because of the further reduction in prospect, a member of one packing concern, interviewed yesterday, doubted very much whether farmers were holding back their lambs from the market. At the same time, he mentioned the issuance of a government order last week which forbids the killing of any lamb under 75 pounds liveweight.

The purpose of this order, he explained, was to get more meat and to prevent lambs being sold earlier than they should.

But in actual practice, he said, no lambs came to the packers after Wednesday of any week. With the present demand for lamb being far in excess of the supply, all the lamb in butcher shops around the city was pretty well cleared out over the week-end.

"Consequently," he added, "in the first part of the week, there is bound to be a scarcity until lambs are bought, killed and distributed. For example, we are killing to-day, but the meat can't be distributed until to-morrow." The marketing of lambs was, in his opinion, about normal, but the demand was twice as great.

"The butchers will all have lamb before the week is out," was his confident conclusion.

On the other hand, a representative of another concern engaged in selling dressed lamb, considered that, in consequence of the lowering of the ceiling, farmers were definitely holding back their lambs from the market.

Electorate Restive Under Regulations

Hon. J. A. McKinnon's View of By-election Results

Edmonton, Aug. 11—Results in the four Federal by-elections Monday, in which Liberal candidates were defeated, "are protest votes against ceilings on wages and farm prices, and the general war-time restrictions," Hon. James A. Mackinnon, Federal Minister of Trade and Commerce, said in an interview here.

"They are just the reaction to controls and restrictions in effect in Canada which, rightly or wrongly, the government considers necessary to the effective prosecution of the nation's war effort," he said.

Letting Building Get Too Cold No Fuel Saver

London, Ont., Aug. 11—L. E. Carrothers, superintendent of buildings for the London Board of Education, said to-day that drastic overnight cooling of school buildings during the winter, as suggested by Munitions Minister Howe yesterday, would result in increased coal consumption if carried too far.

SEES IN PICTURES WORLD LANGUAGE

Photos and Symbols Only Universal Means of Communication, Says Wells

New York, Aug. 11—Pursuit of world unity through creation of a universal language leads up a "blind alley," in the opinion of H. G. Wells. He foresees the next century possibly bringing an increase rather than a decrease in the number of spoken languages.

However, universal communication may be achieved, Wells sets forth in a copyrighted article appearing in the current issue of the Saturday Review of Literature, by the use of photograph to reproduce symbols, diagrams and pictures, and by use of "pigeon" speech in which would be amassed the basic words from many tongues.

"There is scarcely a fact spoken language can express which cannot be conveyed a thousand times as rapidly and completely through the eye," writes Wells. "When we hear talk of re-educating the whole world for unity, the speaker must either have this new visual education in mind or he must be an impracticable wishful thinker or altogether insincere."

"Basic languages" consist of the minimum vocabularies required to talk understandably in any tongue and these, Wells thinks, would be far more suitable for spreading ideas than a newly created universal language.

Stamford Airman Killed Overseas

Parents Have Two Other Sons In Active Service

Niagara Falls, Ont., Aug. 11 (Special)—Mr. and Mrs. Frank H. Hill, Stamford Centre, received a cable from the War Office advising that their son, Sergeant-Pilot William Grant Hill, 25, of the Royal Canadian Air Force, was killed on active service overseas. He received his wings in January, 1943, and went overseas two months later.

Besides his parents, he leaves his wife, Mrs. Mamie Woodbury Hill, 681 Third avenue; a sister, Miss Annie Hill of Kitchener, and three brothers, Jack Hill of Hamilton, Gunner Arthur Hill, overseas, and Leading Stoker Bae Hill of the Royal Canadian Navy.

Yanks Keep Improving

Troops Are Told Of Jungle Foods

Manual Guides Men in Pacific Isles

Washington, Aug. 11 — While Americans on the home front are consuming fresh vegetables from their Victory gardens, armed forces in the Pacific are learning to eat the more palatable varieties of weeds and roots.

"Emergency and Poisonous Plants of the Islands of the Pacific," a gourmet's guide to jungle fare, has made it much less hazardous for forces to pick their own vegetables. The book was written by Dr. E. D. Merrill, of Harvard University, as a technical manual of the War Department describing the edible plants of the Pacific islands as well as the poisonous.

When foraging for food, service men can carry this 149-page pocket manual and refer to the English and Latin descriptions of native plants and to the 113 pen-and-ink illustrations.

No fragment of the legendary Colossus of Rhodes, one of the famous seven wonders of the world, has survived from antiquity.

Eisenhower Supreme Second Front C-in-C.

Montgomery to Lead the British Armies

Early Action in the West Expected

Alexander to Command Allies in Italy

By OUR MILITARY CORRESPONDENT

Early action in the West is heralded by the announcement of a new Inter-Allied Command in Great Britain.

The names of the Allied Supreme Commanders of the "Second Front" invasion armies to liberate Europe from German domination were announced on Christmas Eve.

President Roosevelt revealed in a broadcast that General Dwight D. Eisenhower, 53-year-old Allied Supreme Commander in the Mediterranean, would lead the combined British and American expeditionary forces organising in the United Kingdom.

A statement issued simultaneously from No. 10 Downing Street added that General Sir Bernard Montgomery, G.O.C. British Eighth Army, would command the British invasion armies under General Eisenhower.

In the Mediterranean, General Sir Henry Maitland Wilson, C.-in-C. Middle East, succeeds General Eisenhower as Allied Supreme Commander; and General Sir Harold Alexander, at present General Eisenhower's Deputy in the Mediterranean, becomes Allied C.-in-C. in Italy.

The appointment of General Spaatz, who has commanded the North African Air Forces in the Mediterranean, to command the American Strategic Bombing Force operating against Germany, was also announced by President Roosevelt.

The Downing Street statement also said that various consequential appointments of other com-

Allied Air Expeditionary Force to Act with Armies

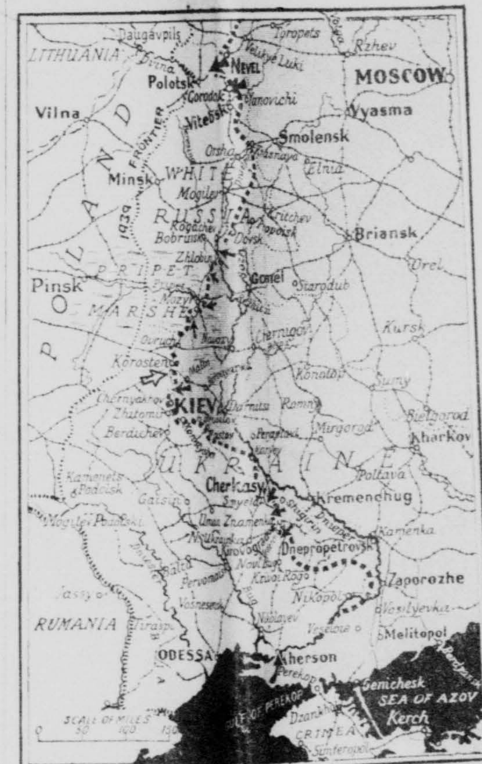
By FREDERICK TOMLINSON
OBSERVER AIR CORRESPONDENT

THE appointment of General Eisenhower's Second Front Air Commanders (in addition to that of General Spaatz already announced) will be awaited with great interest, because at least the initial success of landings in Western Europe will depend on the quality and volume of the air preparation of the bridgehead areas and on the efficiency of the cover and direct support which can be given to the invading forces.

The most obvious choice for the post of Supreme Allied Air Commander would be Air Chief Marshal Sir Arthur Tedder, the present Mediterranean Air Commander, for he has been largely responsible for the development of the new methods of land-sea-air co-operation which are now standard throughout his command.

He knows Eisenhower well, is an air strategist of the highest order, and has brought plans for giving air co-operation to land fighting to perfection.

He has received ungrudging support from American air commanders, and it was the decision of a conference, over which he presided, to throw every available aeroplane into the fight that saved the bridgehead at Salerno in the first days of the Italian landing.



Staying in Mediterranean

But since the Italian campaign has been mainly to gain bases from which the southern air attack on Germany can be mounted, Sir Arthur may be retained in the Mediterranean to control an air campaign complementary to that now being conducted from British bases.

It is to be presumed that what might well be described as an Allied Air Expeditionary Force will contain every type of aircraft needed to support the opening and maintenance of a Second Front.

This force will obviously include long and short-range fighters, both British and American; medium bombers of both forces; fighter-bombers and tactical reconnaissance machines; troop transport and airborne troop-carriers.

Many of the British and American heavy bombers now based in Britain will, judging by the appointment of

Ortona Entirely in Allied Hands

Big 5th Army Attack Report

Ortona, key town to the German Adriatic defence line, is now entirely in Allied hands, according to Cairo Radio and Bari Radio.

The Germans were driven from the town after a stand which, said one report, equalled the fury of Stalingrad. "Suicide squads" lowered tanks into house basements and fired the turret guns through basement windows, with the result that attacking Canadian troops could advance only yard by yard.

All the reports stress the bitterness of the street fighting, which went on for four days before the town was finally taken.

Bari Radio said the town was

Political Aim Behind Tito's

Russians Cu[t] West From

Heavy Soviet Ta[nks] Near Zhitomi[r]

Vitebsk, the important Germ[an] road to Warsaw, is now virtuall[y] Moscow communiqué last night re[ported] road to the supply town of Polotsk has been cut. Russians are five m[iles] Vitebsk railway, and 13 miles fr[om] More than 200 inhabited localities

This brings the total to more than 1,000 in the twelve days of the great offensive south of Nevel.

The Russians have advanced eleven miles in the last 24 hours. Among the places captured yesterday were Zaluchye, 13 miles north of Vitebsk, Kurino, 14 miles to the north-east, and Novka, 17 miles north-east.

The communiqué did not say at which point the highway had been cut. Several stretches of it are within four miles of the railway. The only German escape route now is along the railway running south to the towns of Orsha, Mogilev, and Lhobin, but all these are menaced by Russian attacks.

Gorodok, which protected the northern approaches to Vitebsk was taken by storm in a Christmas Eve assault.

At Zhlobin, nearly two hundred miles to the south, the Russians are repelling repeated attacks by German armour and infantry. In one sector the enemy struck again and again with 80 tanks and three regiments of infantry. On each occasion Russian gunners forced them back with heavy losses.

Breaches Admitted.

The Germans reported yesterday that on the Kiev front east of Zhitomir the Russians have launched an attack on a wide front with 150,000 men, supported by great tank forces. Several breaches in the German lines were admitted. No reference to this was made by Moscow last night.

Heavy fluctuating fighting is still in progress, the German communiqué said. This usually means that the battle is going against them.

At the extreme south of the Russian front, at Kherson, on the estuary of the Dnieper, the Russians are reported to be fighting inside the town, the fall of which is said to be imminent.

Russians Cut Road West From Vitebsk

Heavy Soviet Tank Attacks Near Zhitomir—*Berlin*

Vitebsk, the important German fortress astride the road to Warsaw, is now virtually surrounded. The Moscow communiqué last night reported that the motor road to the supply town of Polotsk, 60 miles to the west, has been cut. Russians are five miles from the Polotsk-Vitebsk railway, and 13 miles from the fortress itself.

More than 200 inhabited localities were captured yesterday. This brings the total to more than 1,000 in the twelve days of the great offensive south of Nevel.

The Russians have advanced eleven miles in the last 24 hours. Among the places captured yesterday were Zaluchye, 13 miles north of Vitebsk, Kurino, 14 miles to the north-east, and Novka, 17 miles north-east.

'The Clouds Are Breaking'

—*The King*

THE King, speaking from a room of the country house where he spent the holiday with the Queen and Princesses yesterday, made a ten-minute Christmas Day broadcast to the Empire (the message is given in full on page 5).

In his broadcast the King said: "As we see the clouds breaking on this Christmas Day, we should take comfort from our faith that out of desolation shall rise a new hope, and out of strife be born a new brotherhood."

An Eighth Army soldier, Bombardier W. Ellis, a native of South Shields, and now living in London, made a speech which preceded the King's broadcast.

Bombardier Ellis said: "I speak for the Army—the Army of Britain and her Empire.

"We are ready now to finish the job with all possible speed. We want a triumphant end, and a quick end. We believe that the hour is now approaching for decisive action.

"It is on the eve of this great event, the greatest moment in the lives of us all, the greatest moment in the life of our country, the greatest day of hope for the freedom of mankind that His Majesty, the King of this Empire and Commonwealth, speaks to his soldiers and his people."

Then His Majesty spoke.

The King has sent a special message to the Merchant Navy and fishing fleets.

200,000 Tons of Bombs on Germany

THE total weight of high-explosive and incendiary bombs dropped on Germany by Allied aircraft now exceeds 200,000 tons.

This figure, it was announced yesterday, was reached as a result of the 1,000 tons attack on Berlin on Thursday night—the seventh large-scale R.A.F. attack on the German capital since November 18.

The second 100,000 tons of bombs has fallen since May 23 last—exactly seven months. The first 100,000 tons were spread over a period from 1940 to 1943.

Sir Arthur Harris, C.-in-C. Bomber Command, said, on May 29: "We can assure the Germans that the next 100,000 tons of bombs will be better bombs and even better aimed, and that the second 100,000 tons will arrive very much quicker than the first. What she has had in the past will be chicken-feed compared with what she is going to get."

Biggest Daylight Raid

The announcement of the 200,000 tons on Germany itself followed an air bombardment of parts of German occupied territory which eclipsed all previous daylight bombing. The attack was directed against the coastal areas of Northern France, and was the culmination of five days' daylight offensive against that region.

More than 2,000 Allied aircraft crossed the Channel on Christmas Eve. The principal target was the Pas de Calais, and although an official statement referred only to "special military installations" as objectives, it is believed that these were German "secret weapon" installations, possibly rocket guns.

Not one Allied plane was lost.

The United States Air Command in Britain alone sent out over 1,300 heavy and medium bombers and fighters, including well over 500 Flying Fortresses and Liberators, the greatest force of four-engined bombers ever sent out to attack a single target.

R.A.F. Mitchells and Bostons, as well as Typhoons, also took part.

Returning crews described the Pas de Calais bombing as exceptionally accurate.

Berlin Still Burning

Fires were yesterday still burning in Berlin which was covered by a blanket of smoke from Thursday night's raid, said a Swedish traveller who left the city early yesterday morning.

The west of Berlin, especially the Neukoeln area, where some of the city's most important factories are situated, was the part most badly damaged the traveller said.

Straits: Misty, Calm

Straits weather last night: Misty and calm, with light variable south to westerly breezes. Visibility poor, especially at low level. Milder.

manders would be announced shortly.

Co-ordination With Red Army

It is no secret that the plans for the opening of the Western Front have been speeded up during the conferences of the last few months. Taken together with the American hint of great battles within the next ninety days, the new appointments indicate that the opening of the battle in the West will be co-ordinated with the Russian winter offensive, and will not wait for the summer campaign in the East.

The choice of General Eisenhower as Supreme Allied Commander will be generally welcomed. It disposes of the reports that General Marshall was to take this most important command of the war.

General Marshall has the reputation of a great strategist. But he has had no actual fighting experience in this war. General Eisenhower has. He has successfully organised and conducted the three greatest amphibious operations of this war—North Africa, Sicily, and Salerno—and he has brilliantly succeeded in co-ordinating the forces of two nations and three services into one unit. This makes him the obvious choice for the great post he now takes.

A new photograph of General Eisenhower.

Popular Appointments

The organisation of his new Command is still not quite clear from the appointments so far announced. The appointment of General Montgomery as C.-in-C. of the British armies under General Eisenhower suggests a certain difference from the Mediterranean organisation, where there was no division in command between British and American land forces.

One need hardly say how extremely popular the appointment of Montgomery will be throughout the British Army. But it is to be hoped that as much as possible of the complete inter-Allied, as well as inter-Services integration will be taken over from the Mediterranean.

There will probably follow a further recasting of Commands from the top downwards. Army groups for the various Continental fronts will have to be superimposed on the various "Commands" formed originally for the defence of Britain. Plans for all this have, of course, long been prepared; it is now a question of translating them into speedy and efficient action.

Command United

The reorganisation of the Mediterranean Command is also important. It seems that the division between a North-African Command for the Western and Central Mediterranean and a Middle East Command for the Eastern basin of the Mediterranean is now ended, and that General Maitland Wilson's Command will stretch along the whole Southern Front from Gibraltar to Cyprus. This in itself is good news, in view of the obvious strategic interdependence of operations in any part of the Southern Front.

Perhaps the general public had expected General Alexander rather than General Maitland Wilson to receive this great command. The extreme brilliance of Alexander's final moves in Tunisia has not been eclipsed by the subsequently somewhat disappointing Italian campaign. Maitland Wilson, who is his senior, has a mixed record as a commander in this war. His handling of the Army of the Nile in Wavell's first offensive was perfect. In Greece he had a forlorn task which he discharged with gallantry. But his operations in Syria in the summer of 1941—hampered, it is true, by some scarcity of equipment—were at the time regarded as somewhat pedestrian, and the abortive campaign in the Aegean this autumn as definitely ill-conceived.

Maitland Wilson, one of the earliest tank experts in the British Army, has nevertheless never lost the confidence of his subordinates, among whom he is extremely popular. He is now shown to have the undiminished confidence also of his superiors. Mr. Churchill has described him as "one of the best tacticians in the British Army." The impending great operations in his enlarged command certainly give him an unprecedented chance to win renown.

Gen. Eisenhower With Montgomery

EIGHTH ARMY FRONT (Delayed)

General Eisenhower and General Montgomery chatted, joked, and studied maps with Corps and Divisional Commanders for twenty minutes when they visited the front-line area.

The two generals, who arrived unexpectedly in an open car, went straight to Headquarters and stood talking within easy earshot of the guns.

General Eisenhower was dressed in a steel blue coat with highly polished field boots. General Montgomery wore his much-badged black beret with a wool-lined leather jacket over his battle-dress tunic and corduroy trousers.—Reuter.

Mr. Churchill: Steady Progress

The following bulletin was issued yesterday from No. 10, Downing-street: "The Prime Minister is making steady progress and gathering strength."

It was signed by only two doctors, Lord Moran, who is Mr. Churchill's personal medical attendant, and Brigadier Evan Bedford.

The previous bulletin, issued on Thursday, reported that the Premier was making steady progress.

...perhaps independent strategic bomber force which will be used for close or distant support of the invasion as occasion demands.

Tying Down Fighters

Part of the heavy bombers' task will undoubtedly be to contain the great force of 2,000 fighters which Germany has created for the protection of the Reich.

The bombers' task will be to prevent these fighters being thrown into the coastal defence of Europe against invasion. If these fighters should be diverted to the invasion areas the whole of Germany will be uncovered for great bomber forces to attack at will.

It will be the task of the Supreme Second Front Air Commander to co-ordinate all forms of air support, whether it be deep penetration into Germany by night or the use of medium or heavy bombers to attack coastal defences by day.

In Britain we possess in Bomber Command and in the 8th United States Air Force unrivalled experience in handling heavy bombers strategically.

The Mediterranean Air Command has had the necessary experience in helping soldiers to win land fights.

It will be important to have men with experience of both forms of air warfare to assist General Eisenhower.

'Americans to Send Most Troops'

WASHINGTON, Dec. 25

Senator Edwin C. Johnson, of Colorado, to-day said he had been told that the United States will furnish 73 per cent. and Britain the balance of troops for the attack on Europe.

Mr. Johnson, who is a member of the Military Affairs Committee, stated that he had obtained his information from what he considered to be a thoroughly reliable source. He added that, while the ratio might shock some Americans, he did not challenge the overall strategic decision.

Cairo Talks

OBSERVER CORRESPONDENT

CAIRO, December 2[illegible]

ALTHOUGH the visit of the eight-man Partisan mission to Alexandria is officially stated to have dealt only with the means of further co-ordinating military action between Yugoslav patriots and Allied headquarters in the Middle East, it is hardly possible to separate these discussions from Yugoslavia's badly-tangled political situation.

It is thought to be more than a pure coincidence that the mission arrived during the height of the controversy between the Partisans and the Government in exile.

General Resigns

Some Allied diplomats who have been closely connected with Yugoslav developments would have preferred, from a purely political point of view, that the discussions had not taken place at this time. In fact, the presence of Tito's representatives in Egypt, which could not help but be interpreted in some quarters as a new gesture of friendship toward the Partisans, has increased the feeling held by some statesmen that military rather than political authorities were deciding how far the Allies should go in recognising the Partisans' position.

It has been apparent for some time that the Anglo-American military leaders have been more pro-Partisan than their political colleagues.

On Friday the resignation of General Zivkovitch, the Yugoslav assistant commander-in-chief, was accepted by the Cairo Government.

General Mihailovitch remains Minister of War and C.-in-C. A few weeks ago the Government was reported to have passed a decree stipulating that no act of the Minister of War would be valid unless countersigned by the Assistant C.-in-C. (Zivkovitch) in Cairo.

...rubble." Heaps of German dead lay everywhere. So important was Ortona to the Germans that Marshal Kesselring threw in elements of three divisions to hold the fifteen-mile stretch between Ortona and Orsogna.

Earlier, the Allied communique had reported further progress at Ortona in spite of stubborn resistance.

Further inland, the communique added, the Eighth Army advanced more than five miles. North of the Ortona-Orsogna line an important German position had been captured.

German front line despatches stated that a Christmas Day offensive had been launched by the Fifth Army north of the Mignano-Cassino road to Rome.

"It is not quite clear," stated Karl Praegner, German News Agency war correspondent, "if this is the long-expected large-scale offensive."

Weather has restricted air activity, but Cecina railway yards were attacked by medium bombers.

Mr. de Valera Tells Eire 'Be Thankful'

Mr. De Valera, broadcasting to Eire on Christmas night, said that they should fervently thank God that they had been so far spared from the horrors of war and pray that they might continue to be spared until the end.

The shortage of necessities had brought privations, but there was not the absolute want which elsewhere in these terrible years had brought starvation and death. Their land had not been devastated, their farmhouses had not been levelled, and their cities had not been destroyed.

After the last shot had been fired a further critical period of years would open for them as well as for all the other nations—years of general readjustment and reconstruction in which restrictions in material things would be bound to continue.

...was stormed by night.

The town possesses good natural defences in the lake of Kosha and the rivers Gorozhanka and Palminka. These had been strongly fortified by the enemy. A very large number of blockhouses and pill-boxes had been built. Minefields had been laid and barbed wire entanglements erected at all the approaches. At least 40 artillery and mortar batteries defended the town.

The Russians crossed the lake and the Gorozhalka river, and won a series of enemy positions.

At the same time other forces crossed the Palminka river and attacked from the north-east. In trying to repel these blows from the flanks, the Germans were compelled to weaken their defences north of Gorodok.

The Soviet Command took full advantage of this and launched an attack from the north. Advance units soon reached the outskirts of the town.

The battle developed into one of the bitterest since the original break-through. The Germans, attacked on three sides, were driven back into the town. Fierce hand-to-hand fighting raged in the streets and at the railway station.

The Germans lost 2,500 dead before they were expelled from Gorodok. They abandoned large quantities of equipment, including fifteen tanks.

The Germans retreating from Gorodok are being heavily pressed. The Russians are cutting across many of the secondary roads on the approaches to Vitebsk.—Reuter and B.U.P.

Wreath for Darlan's Assassin

Members of the French Consultative Assembly, who represent the French Resistance Movement in Algiers, will place a wreath to-day on the grave of Bonnier de la Chapelle, the twenty-year-old Frenchman who shot Admiral Darlan on Christmas Eve a year ago.

De la Chapelle was executed on the morning of December 26.—Reuter.

Gold Reserves a Pawn in the Yugoslav Political Crisis

By OUR DIPLOMATIC CORRESPONDENT

FINANCIAL as well as political questions are involved in the issue of who shall speak in the name of Yugoslavia—the refugee Government in Cairo or the de facto regime recently established by the Yugoslav Resistance Movement, under the leadership of Tito and Ribar.

The Yugoslav gold reserves which were saved from the Germans in 1941 and taken to the United States are believed to amount to some £20 millions—a very substantial sum for a relatively poor country like Yugoslavia. The stewardship of these funds appears to have been entrusted to Mr. Fotitch, the Yugoslav Ambassador to the United States, subject to the approval of the State Department and the Treasury in Washington.

Bank Notes in London

Mr. Fotitch was appointed Ambassador to the United States by the former pro-Axis Dictator of Yugoslavia, Stoyadinovitch, who is now in British custody in the island of Mauritius.

Thus far it has not been necessary for successive Yugoslav Governments in exile to make any appreciable inroad upon these resources, the reason being that they had at their disposal considerable sterling and dollar balances with which to meet current expenditure. Now, however, these balances are believed to be almost exhausted, and the question arises whether the Government in Cairo shall be recognised as possessing the right to use the State gold reserves or to contract loans in the name of Yugoslavia.

There is another financial aspect to the problem of Yugoslav authority. According to a report current in London, some time ago the Yugoslav refugee Government then in office contracted for the printing in London of Yugoslav banknotes to the amount of 10,000 million dinars. These notes were intended for use by the exile Government when it returned to liberated Yugoslavia.

What the effects of such a step would be on the financial and economic structure of the country is a matter of conjecture, but there can be no doubt that it would place a formidable political weapon in the hands of the returning Government.

On the political side, too, the question of which Government shall be recognised as representing Yugoslavia is becoming more and more insistent. The new Provisional Government set up inside Yugoslavia has declared its intention not to recognise any international commitments hereafter undertaken by the shadow regime in Cairo; it has also intimated that, when the moment comes for Yugoslavia to be represented on the Italian Advisory Commission the Provisional Government alone is qualified to choose the Yugoslav representative.

The unreality of the present situation is underlined by the fact that Britain, America, and the Soviet are still in full diplomatic relationship with the refugee Government, while they maintain close liaison with the Provisional Government, and are giving increasing military support to the Partisan forces. Tito has been recognised as an Allied army commander.

King's Chance Lost

The members of the Cairo Government, by their bitter and undignified fulminations against the Partisans and the Provisional Government have banged the door once and for all against any hope of a compromise. In so doing, they have sealed their own political fate. By not repudiating their action, and dismissing them from office, King Peter is letting his chance of regaining the throne slip through his fingers; indeed, the moment may already have passed for him to redeem it.

For the past eighteen months the popular movement inside Yugoslavia has been growing in strength and playing an increasingly important role against the enemy. Meanwhile, each Yugoslav Government in exile has been weaker and more narrowly Serb in outlook than its predecessor.

Each insisted on retaining Mihailovitch as Minister of War, in spite of his ambiguous position, and failed to agree even on the broad principles on which Yugoslavia might be re-created.

The Provisional Government has already proclaimed its objective of a united Yugoslavia, based on the federal principle. To this body has fallen the task of preserving the Yugoslav ideal.

Iraq Premier Forms New Cabinet

BAGDAD, December 25

General Nuri Es Said, the Iraq Prime Minister, who resigned a few days ago, has formed a new Cabinet in which he has taken the portfolio of Defence in addition to the premiership. His new cabinet is formed for the most part of experienced politicians.

Tewfik Suweidi, a former Prime Minister and Foreign Minister, is made Deputy Prime Minister, a newly-created post. Subhi Al Duftari, becomes Minister of Foreign Affairs, Omar Nadhmi, Minister of the Interior, Ali Mumtaz, Minister of Finance and Sadik Bassam, Minister of Justice.—Reuter.

Vichy Ex-Ministers in Military Prison

The Vichy ex-Ministers, Marcel Peyrouton and Pierre Pucheu, the former French Premier, Pierre Etienne Flandin, and the former Air Minister, General Bergeret, have been transferred to a military prison in Algiers, reports Algiers Radio.

Their status is that of officers under arrest. The four men are being held for trial by a military court on charges of collaboration with the enemy.

CHRISTMAS PLAYS

MR. TERENCE RATTIGAN'S new play at the Globe is called **"While the Sun Shines,"** but it might as well be called "Albany Moonshine," "The Earl and the Girl," or "Our Boys in the Clifford Bax Country." There is no effort here to renew the poignancies of "Flare Path"; the play descends rather from (or to) "French Without Tears" and an obedient first-night audience was entranced by the humours of a British duke astray in Albany and the French language. He is, incidentally, trying to marry his daughter to a two-million-pound earl, now a naval rating. The too hospitable earl has a habit of entertaining back-room boys (they seem to sleep as many to a bed in war-time Albany as in Blackpool in August) and that leads to the usual troubles of farce. This play seemed to me amusing whenever Mr. Ronald Squire (as the duke) and Miss Brenda Bruce (as a trollop) were on the stage, charming whenever Miss Jane Baxter was impersonating the W.R.A.F., but not raffish, daughter, aggressively entertaining when Mr. Hugh Macdermott, as an American airman, was in command, but otherwise a quite ordinary pursuit of routine fun. The second act is handicapped because Miss Baxter never appears and the third act is rather dull, despite the fact that she does. But it will be an enormous success. The humours of an English earl, American airman, and French sailor sharing a bed while a brace of ladies wait in the offing are war-time winners without a doubt. But is this quite in tune with the Tennent tradition and "the great Globe itself"?

* * *

Emile Littler's **"Humpty Dumpty"** at the Coliseum gives one the rare pleasure of being concerned about a pantomime plot. Humpty, it seems, lived in what is now known as a shell-egg. This was perched on a wall, and nobody (believe it or not) stooped to steal it or otherwise get cracking. At last it fell over under sinister influence, thus causing King Yolk to lose his crown. Then there was a general embarkation, fun in a revolving cabin, a journey to Snowland, and home to the Palace of Sugar by way of a haunted house. In the course of all this, Principal Boy, of course, meets Girl. The boy is described as Prince of Truly-Rural, which must be a misprint for Truly-Crural, since boy (Miss Pat Kirkwood) shows a leg of incomparable grace while rendering the songs of dash and devotion with a spirit proper to the role. The clowns are a quartette whose renewal of old acquaintance is always a slapstick carnival of the highest. If parlours are to be papered or houses haunted, then Messrs. Nervo, Knox, Naughton, and Gold (with Mr. Hal Bryan also running) are the perfect engineers of riot. With such house-breakers at work, the full holiday house is assured from the start. But they should leave Shakespeare alone. If you like to see a young lady turned into a projectile or teetotum, Miss Juanita (with the Brothers Ganjou) does this more daringly and stylishly than any. There's a nice "panto" horse and all the trimmings.

The Players' Theatre Club con-[...] pantomimes of our ancestors. This year's revival is Byronic, being the 1860 **Cinderella** of H. J. B., whose unwearying facetiae regaled the human species of eighty-three years ago. (The rhyme is his own—and typical.) Students of history will observe that since 1860 the part of Dandini has gone down in the world and the part of Buttons gone up. Dandini gets into the sub-title, which is "The Lover, The Lackey, and The Little Glass Slipper." The business of Pantomime then seemed to begin and end with punning in rhyme (there was less knock-about than in our days of Nervo-and-Knoxery), and H. J. Byron's ingenious industry played on words like some frantic xylophonist on his keys. Prince Charming, then called Prince Poppetti, and Dandini are played with a grand flourish by the Misses Boys and Bidmead, Miss Preney's Cinders has the right daft innocence, and Mr. Harradine is equally happy as adapter and actor of this period escapade. The lyrics and score range from oysters crossed in love to John Gay, Stephen Foster, and Donizetti. The harlequinade is a beauty, and Mr. Woolley's scenic knack has wit and fancy, too.

I. B.

* * *

A modern **"Cinderella"** needs the Board of Trade for her Fairy Godmother: if the young lady is to emerge from rags and go to the ball in proper outfit, coupons not pumpkins are required. Theatres seem to be generously treated in this respect; in any case ingenuity helps out shortages of the old splendour. So Cinders at His Majesty's, prettily presented by Carole Lynne, duly melts the public's heart in the kitchen, takes its eyes in the ball-room, and soothes its ears with song. Miss Evelyn Laye's Prince Charming charms sight and hearing, too, and gives a sparkle to the show, which goes along gaily. Miss Tessie O'Shea's grand mixture of energy, volume, and beneficence is perfect for pantomime comedy, but Mr. George Moon's Buttons needs a better script on which to use his talent. No complaints are likely. Audiences have plenty of colour and sound to see, hear, and go home singing for themselves.

F. T.

* * *

Lewis Carroll is not easy to dramatise; if **"Alice in Wonderland"** is broadened or fussily fantasticated, the wonder vanishes. Miss Clemence Dane has left the books to speak unadorned. Text, and scenes at the Scala are unhampered Carroll-and-Tenniel—Miss Gladys Calthrop's designs are miraculously right—and the result is an illustrated edition-de-luxe to enchant all followers of the White Rabbit. Children who know nothing of Wonderland or the Looking-Glass country may be faintly puzzled, but even the youngest of these must warm to the wide-eyed eagerness of Miss Roma Beaumont's Alice. Dame Sybil Thorndike revels in a pair of Queens (does her Queen of Hearts, suppressor of guinea-pigs, sigh for blank verse?), and the whole pack of cards, creatures, and chessmen, directed ingeniously by Miss Esmé Church, makes of this a Christmas Carroll to be enjoyed for its wit and honoured for its discretion.

J. C. T.

Radio

By TOM HARRISSON

WAR'S Christmas times bring us better cheer, whatever the news or the weather. In fact, the worse the weather the more Christmassy we feel it to be, and that quaint, faint crackling of snow in the air, which gets into our loudspeakers, is for once welcomed. The wireless has added much to Christmas. This year the B.B.C. responded to the Christmas season in suitable spirit and with unusual intelligence. There were plenty of church services, notably that on Christmas morning from Lowdham village, Notts; "Scrooge," as usual, accentuated by J. B. Priestley's "New Judgment" on Dickens; and a Gordon Boshell ghost story, as well as Dorothy Sayers's Nativity play and a mock-pantomime by witty Michael Barsley.

John Burrell's worth-while production of "Pilgrim's Progress" was repeated; but there was a shortage of worth-while music. We had plenty of jazz and variety, including Joyce Grenfell, Handley, Flanagan and Allen, inimitable Gracie Fields, imitable Frances Day, and all. A stocking full indeed! For some years we have been spared the extreme form of world-wide greeting; this year's "WE ARE ADVANCING" avoided some, not, alas, all, of radio's "international brotherhood" fuss. Yet it is in this linking of people, sensibly and sensitively done, that wireless can be most seasonable.

Fellowship

The B.B.C. has noticeably not developed this potential fellowship. True, the whipped-up "mateyness" exploited commercially by Radio Luxembourg and U.S.A. stations can become exhausting. Nevertheless, there is room for people to feel that listening is something sociable and shared, not wholly personal and passive. The apathy of leisure threatens to weaken those positive aspects of citizenship on which any healthy democracy depends. We increasingly pay to see or hear about others doing things (including thinking) for us, instead of doing them ourselves. Radio charges least for the largest quantity of such comfortable service.

It is pleasant to accept these facilities, and one of the easier sorts is the radio game, with "Quiz" a good first. To me it seems effective popularisation, which slides varied information, often useless, yet healthily factual, into ears otherwise untouched. Then there is Puzzle Corner, including Ronnie Waldman's ingenious method of challenging listeners to detect a "deliberate mistake" and write in about it, thus stimulating active audience participation. From this it is a simple stage to the criminal mistake. In "Crime Chasers, Ltd.," we have two young people bringing curiously-timed crimes, which they solve in the prescribed five minutes; solution later in the programme. Chief Inspector French (Milton Rosmer) was more probable and thought-provoking (solution-as-you-go) in the recent excellent series written for radio by that good craftsman, Free-

The Open Air

TIME was when the fathers of the Church discouraged the use of evergreens for the celebration of Christmas, no doubt because of its old Saturnine associations, but though other evergreens more or less surrendered to the protest holly survived, thanks perhaps to its innate cheerfulness. We have only three indigenous evergreen trees in Britain, perhaps not more than two in England. The only native fir or pine—for either word is now accepted—is the Scotch, and that belongs properly to the North. The yew and the holly remain.

The song-writers sang of "the bonny ivy-tree"; but you cannot fitly call a creeper a tree; and though the ivy, as the last of the plants to flower, is a godsend to shivering wasps and flies in their latter hours; and gives a hybernaculum to the cheerful sulphur butterfly and bats; provides food for both mice and woodpigeon, and—in France at any rate—is fed to the sheep, its appearance is on the whole gloomy. In a fifteenth century carol it was only allowed to decorate the outside, not the inside, of the house which was reserved for the merry, smiling holly. So even in war time the demand for holly has been insistent. A Home Guard unit was discovered carrying off a small lorry load for decoration. Barracks and homes and churches will all be as fully decorated as ever, with the gay tip-tilted leaves and coral, or sometimes yellow, berries.

Deep Colour

It is the only native evergreen to which our landscape owes a debt. What background is fuller of deep colour, even if male trees prevail, than the tall holly hedges most common in Bucks and Herts. In the wooded districts of the New Forest, of Epping, and, not least, of Dean, the hollies shine out through the filtered light with a surprising reaction to the shaded site. The scene of the old Speech House between Wye and Severn is irrecoverable without its hollies. The very author and begetter of the art of forestry in England, John Evelyn, rightly claimed it as the best of all hedges. We murder the yew or debase it into a gloomy dust-trap when we carve it into a dense dark wall, of severe, unnatural lines. Even as a hedge the holly never loses its cheerfulness. It will be remembered that its appearance so excited John Evelyn's tenant, the Czar of Muscovy, that he tilted at it with a wheelbarrow.

Added Virtue

As I write, little parties of villagers are visibly dotted about the Common reaching up to the berried spray; and some of these bushes that are almost trees are red also with the hips of the dog-roses that have used this support. For here is an added virtue of the holly in any garden. It can be garlanded with what bright creeper you desire and suffer no harm. Even the severe and often thoughtless pruning inflicted by the Christmas decorators seems to do the trees good. Leaves more sharply pointed with spines thrust out in greater numbers. So let us decorate with holly, and thereafter sow some of the berries. They will not germinate till their second [...]

Art

By OSBERT LANCASTER

ENGLISH art, as we are so constantly and sometimes a trifle brusquely reminded, has never for long succeeded in shaking off the influence of literature. And indeed the literary, as opposed to a purely formal aesthetic, stimulus has produced many of those works which are usually considered masterpieces of English painting from the time of Hogarth onwards. Sometimes it ceases to operate almost as soon as the painter sets brush to canvas, as with Sickert, and is forgotten in the excitement of pursuing formal relationships or atmospheric effects; at other times, as with the Pre-Raphaelites or, in our own day, a painter such as David Jones, it remains the main driving-force until the completion of the picture. Whether or not British painting suffers irretrievably from the effects of this long and seemingly indissoluble liaison with literature remains a matter of keen dispute. But that, as a result, we have produced a greater number of illustrators of the highest genius than any other nation is a fact which cannot be denied.

Many Masters

The current exhibition, arranged by C.E.M.A., at the **National Gallery** "English Book Illustration since 1800" is, therefore, of the greatest interest and importance. It must, however, straightway be admitted that owing largely to the limitations imposed by war-time conditions it is not altogether worthy of its great theme. One constantly feels the need for more space (there are too many examples in too few cases) and the range of many of the greatest masters is hardly indicated by the two or three specimens of their work which are all that it has proved possible to show. Cruikshank, for instance, is very properly represented by one of his engravings for "Oliver Twist" and a plate, but by no means the best, from the Comic Almanac, but one looks in vain for one of those miraculous street scenes into which he seems with half a dozen scratches of his needle to have compressed all the atmosphere, the misery, and the romance of mid-nineteenth-century London, or any example of those fairy-tale illustrations which Ruskin rated as among the greatest artistic achievements of his day. Similarly Doyle is represented by one of his pretty but not outstanding children's books, but not by his masterpiece "Manners and Customs of Ye Englisshe." Moreover the arbitrary selection of 1800 as the starting point excludes some of the greatest topographical books; to take only one example "Malton's Views of Dublin" is of its kind finer than anything here.

Christmas Choice

Much, however, remains to praise, and such criticisms as these may well seem a little ungracious in view of the difficulties which have to be overcome by anyone organising an exhibition such as this in war-time. The selection of the modern examples is generous and well chosen and the catalogue admirably prefaced and properly informative. Until such time as it proves possible to [...]

THE FI[...]

By C. A. LEJ[...]

THIS Christmas in the cinema is brightened for Londoners by the revival of two of the best works of the best artists in the profession. Disney's **Snow White and the Seven Dwarfs** (New Gallery) and Duvivier's **Un Carnet de Bal** (Studio One) are back for a season at the theatres which celebrated their first triumphs in this country.

A hint that "Carnet" is on view again in the West End should be enough for the alert readers of this column. They have never been known yet to neglect a good thing, nor have I ever been backward in singing the praises of this picture. As for "Snow White," there isn't the smallest doubt that it will bring the holiday queues back to Regent-street. A wide-eyed generation of children has grown up since the dwarfs' "Hi-ho" first echoed through the diamond mines, since the baby bluebird essayed his first high note, since Snow White first whispered her dreams into the Wishing Well. Unless I am a shockingly bad guesser about humanity, the New Gallery will be the family Mecca this Christmas.

* * *

That is as it should be, for "Snow White" is a classic. When all the other Disney films are forgotten, "Snow White" is likely to be remembered. Admittedly it is far from being the best technical job Disney has ever done. It was the studio's first experiment in full-length cartoon, and has all the roughness and error of a first try. It is full of faults in draughtsmanship and animation. The Prince sadly lacks bone and sinew. Snow White herself is a chocolate-box cutie. The opening scenes jump like a magic-lantern slide. But the thing as a whole has a happiness, a proportion, that has never been caught in any later Disney. "Snow White" is a joyous film. I don't know when I have seen a film more heart-warming. Its simple animal sketches, simple story, and simple little tunes have created between them the happiest effect of spring magic. It is one of those blessed, unpredictable things that seem to have been born under a lucky star. You have only to glance at the look on a child's face to know that it is enchantingly right for an enchanted audience. I saw "Snow White" for the fifth time this Christmas. I came away whispering inwardly, "Do it again!" like the child in Chesterton's "Ethics of Elfland." But my adult philosophy tells me, these things are rarely done again.

* * *

Two other happy revivals for the Christmas holidays may be found side by side in Charing Cross-road. The Tatler is showing the Soviet playtime sketch, a fairy-tale in colour, called **The Little Hump-backed Horse**, old, naive, but appealing. The Astoria has the Fleischer Technicolor cartoon, **Hoppity Goes to Town**, the story of an insect colony who make the great trek to the top of a sky-scraper in search of social security, better housing conditions, and a free world for their children. "Hoppity" hasn't the delicate charm of "Snow White"; it is less endearing than the Disney work, but in its own rather crude way [...]

Radio

By TOM HARRISSON

WAR'S Christmas times bring us better cheer, whatever the news or the weather. In fact, the worse the weather the more Christmassy we feel it to be, and that quaint, faint crackling of snow in the air, which gets into our loudspeakers, is for once welcomed. The wireless has added much to Christmas. This year the B.B.C. responded to the Christmas season in suitable spirit and with unusual intelligence. There were plenty of church services, notably that on Christmas morning from Lowdham village, Notts; "Scrooge," as usual, accentuated by J. B. Priestley's "New Judgment" on Dickens; and a Gordon Boshell ghost story, as well as Dorothy Sayers's Nativity play and a mock-pantomime by witty Michael Barsley.

John Burrell's worth-while production of "Pilgrim's Progress" was repeated; but there was a shortage of worth-while music. We had plenty of jazz and variety, including Joyce Grenfell, Handley, Flanagan and Allen, inimitable Gracie Fields, imitable Frances Day, and all. A stocking full indeed! For some years we have been spared the extreme form of world-wide greeting; this year's "WE ARE ADVANCING" avoided some, not, alas, all, of radio's "international brotherhood" fuss. Yet it is in this linking of people sensibly and sensitively done, that wireless can be most seasonable.

Fellowship

The B.B.C. has noticeably not developed this potential fellowship. True, the whipped-up "mateyness" exploited commercially by Radio Luxembourg and U.S.A. stations can become exhausting. Nevertheless, there is room for people to feel that listening is something sociable and shared, not wholly personal and passive. The apathy of leisure threatens to weaken those positive aspects of citizenship on which any healthy democracy depends. We increasingly pay to see or hear about others doing things (including thinking) for us, instead of doing them ourselves. Radio charges least for the largest quantity of such comfortable service.

It is pleasant to accept these facilities, and one of the easier sorts is the radio game, with "Quiz" a good first. To me it seems effective popularisation, which slides varied information, often useless, yet healthily factual, into ears otherwise untouched. Then there is Puzzle Corner, including Ronnie Waldman's ingenious method of challenging listeners to detect a "deliberate mistake" and write in about it, thus stimulating active audience participation. From this it is a simple stage to the criminal mistake. In "Crime Chasers, Ltd.," we have two young people bringing curiously-timed crimes, which they solve in the prescribed five minutes; solution later in the programme. Chief Inspector French (Milton-Rosmer) was more probable and thought-provoking (solution-as-you-go) in the recent excellent series written for radio by that good craftsman, Free-

THE FILMS

By C. A. LEJEUNE

THIS Christmas in the cinema is brightened for Londoners by the revival of two of the best works of the best artists in the profession. Disney's **Snow White and the Seven Dwarfs** (New Gallery) and Duvivier's **Un Carnet de Bal** (Studio One) are back for a season at the theatres which celebrated their first triumphs in this country.

A hint that "Carnet" is on view again in the West End should be enough for the alert readers of this column. They have never been known yet to neglect a good thing, nor have I ever been backward in singing the praises of this picture. As for "Snow White," there isn't the smallest doubt that it will bring the holiday queues back to Regent-street. A wide-eyed generation of children has grown up since the dwarfs' "Hi-ho" first echoed through the diamond mines, since the baby blue-bird essayed his first high note, since Snow White first whispered her dreams into the Wishing Well. Unless I am a shockingly bad guesser about humanity, the New Gallery will be the family Mecca this Christmas.

* * *

That is as it should be, for "Snow White" is a classic. When all the other Disney films are forgotten, "Snow White" is likely to be remembered. Admittedly it is far from being the best technical job Disney has ever done. It was the studio's first experiment in full-length cartoon, and has all the roughness and error of a first try. It is full of faults in draughtsmanship and animation. The Prince sadly lacks bone and sinew. Snow White herself is a chocolate-box cutie. The opening scenes jump like a magic-lantern slide. But the thing as a whole has a happiness, a proportion, that has never been caught in any later Disney. "Snow White" is a *joyous* film. I don't know when I have seen a film more heart-warming. Its simple animal sketches, simple story, and simple little tunes have created between them the happiest effect of spring magic. It is one of those blessed, unpredictable things that seem to have been born under a lucky star. You have only to glance at the look on a child's face to know that it is enchantingly right for an enchanted audience. I saw "Snow White" for the fifth time this Christmas. I came away whispering inwardly, "Do it again!" like the child in Chesterton's "Ethics of Elfland." But my adult philosophy tells me, these things are rarely done again.

* * *

Two other happy revivals for the Christmas holidays may be found side by side in Charing Cross-road. The Tatler is showing the Soviet playtime sketch, a fairy-tale in colour, called **The Little Humpbacked Horse,** old, naive, but appealing. The Astoria has the Fleischer Technicolor cartoon, **Hoppity Goes to Town,** the story of an insect colony who make the great trek to the top of a sky-scraper in search of social security, better housing conditions, and a free world for their children. "Hoppity" hasn't the delicate charm of "Snow White"; it is less endearing than the Disney work; but in its own rather crude way it …

… out on a wild party with some American soldiers, wakes up in the morning with a dim memory that she has been married, finds herself pregnant, goes through an emergency wedding ceremony with a harassed rustic lover (Eddie Bracken), and makes everything nice and cosy by becoming the mother of sextuplets. This seems to me a bad joke in the poorest possible taste, the sort of film that makes me groan in spirit; but I am bound to recommend it to the technicians; it is neat, it is crisp, it has been done by a man who knows his cinema brilliantly.

* * *

Jane Eyre (Odeon) will positively be adored by thousands. It is a lovely romance about an orphaned governess who goes to live in a fog-wreathed, bastioned, Gothic castle, and falls in love with her black-avised employer, who keeps a mad wife tucked away somewhere beneath the battlements. Joan Fontaine makes a pretty mouse of Jane; Orson Welles, although monstrously miscast, works his way through the role of Mr. Rochester by sheer dint of hard acting. The script is attributed to Aldous Huxley, Robert Stevenson, and John Houseman, and we even see a replica of the opening chapter: "My name is Jane Eyre. I was born in 1820, a harsh time of change in England." Set up in folio and bound in vellum, this Huxley - Stevenson - Houseman "Jane Eyre" is both handsome and impressive. And yet I retain a weakness for a plain old thing of the same name by one Charlotte Brontë, beginning "There was no possibility of taking a walk that day. We had been wandering," etc.

Best Foot Forward (Empire), with Lucille Ball, is a musical comedy about a film star who turns up at an American college and causes a riot. Some day we shall see a film about a student who turns up at an American college. That should be a scream.

SUBURBS AND PROVINCES

Girl Crazy.—Boy a bit eccentric, too. Mickey Rooney and Judy Garland ensure the future of a college in the prairies by installing co-education and an annual rodeo.

Wintertime.—Sonja Henie, as a Norwegian heiress travelling in Canada, delights and surprises everyone by proving she can skate.

Let's Face It.—*You don't have to.*

THEATRE DIARY

To-morrow.—"CINDERELLA," His Majesty's (Evelyn Laye, Tessie O'Shea). "WHERE THE RAINBOW ENDS," Winter Garden.

Tuesday.—"LES JOURS HEUREUX," comedy by Claud-André Puget, Rudolf Steiner Hall (French Players; directed by Edward Stirling).

Thursday.—"WINKLES AND CHAMPAGNE," a "Cavalcade of Music Hall," Unity Theatre.

"PETER PAN"

There was the usual enthusiastic audience for **"Peter Pan"** at the Cambridge, where Glynis Johns is a most graceful Peter, while Miss Cicely Byrne, as Mrs. Darling, and Mr. Baliol Holloway, in the Darling-Hook hook-up, represent the …

pence - coloured, pun-groaning | "Peter Pan": Col. 7.

man Wills Crofts.

Amateur Theatricals

The popular Red Cross competitions are too much of a hotchpotch for my taste, although it is amusing to try to tell which of three sounds is Stuart Hibbert blowing his noise. The aerial amateur theatricals, lately represented by "I WANT TO BE AN ACTOR," have not been so entertaining as they were earlier in the war. Caricatured villains and heroines are funny only if well acted, or if the script is well written. They are boring when performers fall between the stools of serious effort and adequate caricature. The business of picking amateurs out of an audience needs to be convincingly done, too. I must admit, however, that my nine-year-old loves it.

All these, and other, radio games may be less than home initiative and personal play. But they are certainly less like "dope" than much that we hear on our air, in those cubic areas of the so-called Forces Programme. The full and important possibilities of tying broadcasting to intelligent citizenship and vigorous democracy have barely been recognised, except perhaps in Scandinavia, and certainly sadly ignored here in Britain.

This Week:

TO-NIGHT.—John Gielgud in "THE PILGRIM'S PROGRESS" (Home, 9.30 p.m.). FRIDAY.—Special New Year's Eve programmes (Home, 9.20 p.m. to 12.20 a.m.). SATURDAY.—"ATLANTIC SPOTLIGHT" (Forces, 5.30 p.m.); Edith Evans in "THE LATE CHRISTOPHER BEAN" (Home, 9.35 p.m.).

MANY QUESTIONS: A Combined Quiz

I. GENERAL

Set by OBSERVER

1. What was Mr. Churchill's seventeen-word phrase in honour of the R.A.F. in the Battle of Britain (House of Commons, August 20, 1940)?
2. Who said: "To be prepared for war is one of the most effectual means of preserving peace"?
3. Name (*a*) The Minister of Food; (*b*) The Dean of St. Paul's; (*c*) The Governor-General of Australia; (*d*) Chairman of the Presidium of the Supreme Soviet of the U.S.S.R.; (*e*) The Editor of *The Times*.
4. How old are (*a*) Mr. Lloyd George; (*b*) Mr. Bernard Shaw; (*c*) Lord Wavell; (*d*) Mr. Roosevelt; (*e*) Lord Louis Mountbatten; (*f*) Mr. Noel Coward?
5. How many counties are there in Northern Ireland? Name them.

II. DRAMA

Set by IVOR BROWN

1. How many Shakespeare characters were called Antonio? Who were they?
2. (*a*) Who organised the first Shakespeare Festival at Stratford-on-Avon? (*b*) What play of Shakespeare's was acted? (*c*) What famous author attended? (*d*) What actor-dramatist came to make fun of it?
3. (*a*) Which play of Bernard Shaw's was booed on its first night by one man in the gallery? (*b*) Who was he? (*c*) What was Shaw's answer?
4. What famous dramatist assisted Conan Doyle to write what comic opera?
5. When did Gracie Fields play a straight part in the West End?

III. FILMS

Set by C. A. LEJEUNE

1. What was the first full-length all-talking film shown in England? What year?
2. Who directed the following: (*a*) The Story of Louis Pasteur; (*b*) The Life of Emile Zola; (*c*) This Man Reuter; (*d*) Edison the Man; (*e*) Journey Into Fear?
3. In what film did Donald Duck first appear?
4. In "The Private Life of Henry VIII," who played Henry's six wives?
5. Who are Joe Yule and Miguel Ratonocito?

IV. ART

Set by OSBERT LANCASTER

1. Give the proper names of (*a*) El Greco; (*b*) Ape; (*c*) Tintoretto; (*d*) the Beggarstaff Brothers.
2. What famous painter was (*a*) a diplomat; (*b*) stockbroker; (*c*) a natural son of Talleyrand; (*d*) a Communard; (*e*) a racing cyclist?
3. Who said of whom "Nothing happens in his pictures except some indifferent persons asking the way of somebody else, who, by their cast of countenance seem not likely to know it"?
4. Fill in the missing names (*a*) "*Le violon de* ——"; (*b*) "*le divin* ——"; (*c*) Birdsnest ——"; (*d*) Athenian ——"; (*e*) Douanier ——"
5. Who said of what buildings (*a*) "A blazing arch of lucid glass Leaps like a fountain from the grass"; (*b*) "Inexplicable splendour of Ionian white and gold"?

V. THE WAR

Set by LIBERATOR

1. Which was the first Allied victory on land in this war?
2. Which Russian Commander opposed which German Commander in June, 1941, on (*a*) the Northern Front; (*b*) the Central Front; (*c*) the Southern Front?
3. How many ships were employed in the North African landing of November 8, 1942?
4. Which European capitals were declared "open cities" during this war?
5. One belligerent nation during this war was publicly promised complete victory by a certain date. Which nation, by whom, when, and by what date?

VI. LITERATURE

Set by J. C. TREWIN

1. Where do we find (*a*) Mr. Salteena; (*b*) Madam-de-Maine; (*c*) Lupin Pooter?
2. Who wrote (*a*) "Cheddar Pinks"; (*b*) "Go, Lovely Rose"; (*c*) "The Lent Lily"; (*d*) "The Sundew"?
3. Name the latest book by (*a*) Wendell Willkie; (*b*) John Masefield; (*c*) Richard Llewellyn.
4. Sources of:
   (*a*) "Spade! with which Wilkinson hath tilled his lands!"
   (*b*) "With the poor crooked scythe and spade."
5. Who lived at (*a*) Rosings; (*b*) Manderley; (*c*) Thornfield Hall?

VII. RADIO

Set by TOM HARRISSON

1. How many, if any, B.B.C. Governors have titles?
2. What is the effect of connecting earth wire to aerial terminal on your set?
3. On what date, in what language was the first B.B.C. foreign service?
4. What country broadcasts the least music?
5. What is the average pay for a B.B.C. Home Talk?

VIII. OPEN AIR

Set by SIR W. BEACH THOMAS

1. Do grass-snakes and/or adders lay eggs?
2. What causes the peculiar quiver of aspen leaves?
3. What are (*a*) a drey and (*b*) a form?

man Wills Crofts.

Amateur Theatricals

The popular Red Cross competitions are too much of a hotchpotch for my taste, although it is amusing to try to tell which of three sounds is Stuart Hibbert blowing his noise. The aerial amateur theatricals, lately represented by "I WANT TO BE AN ACTOR," have not been so entertaining as they were earlier in the war. Caricatured villains and heroines are funny only if well acted, or if the script is well written. They are boring when performers fall between the stools of serious effort and adequate caricature. The business of picking amateurs out of an audience needs to be convincingly done, too. I must admit, however, that my nine-year-old loves it.

All these, and other, radio games may be less than home initiative and personal play. But they are certainly less like "dope" than much that we hear on our air, in those cubic areas of the so-called Forces Programme. The full and important possibilities of tying broadcasting to intelligent citizenship and vigorous democracy have barely been recognised, except perhaps in Scandinavia, and certainly sadly ignored here in Britain.

This Week:

TO-NIGHT.—John Gielgud in "THE PILGRIM'S PROGRESS" (Home, 9.30 p.m.). FRIDAY.—Special New Year's Eve programmes (Home, 9.20 p.m. to 12.20 a.m.). SATURDAY.—"ATLANTIC SPOTLIGHT" (Forces, 5.30 p.m.). Edith Evans in "THE LATE CHRISTOPHER BEAN" (Home, 9.35 p.m.).

F--D F---S

Christmas Quiz

Is Father as all-wise as he thinks he is? How many facts about food does Mother really know? What do the children know about things on the Food Front? Here's the way to find out! Try your hand at these questions. Make a game of it round the fire this evening and see whether the men or womenfolk score the highest. The total score is 40 for each set of questions. 35 is excellent; 25 not bad; anything less than 20 is—probably Father! (The one with the lowest should be made to do the washing-up.)

DOES MOTHER KNOW HER P'S AND Q-PONS?

(Try these on the girls too)

1 **Which is the correct way to wash cooking fat so that it can be used again?**
(*a*) Pour boiling water over it; (*b*) Rub through a fine sieve; (*c*) Bring to the boil in water, pour into a bowl; when cool, lift off and scrape underneath; (*d*) Hold it under running cold water. *Score 10*

2 **Two of the following are correct reasons why children need cod liver oil. Which two?**
(*a*) To make their hair curl; (*b*) To prevent rickets and build strong, sturdy bodies; (*c*) To make them good at arithmetic; (*d*) To increase resistance to infection and ward off colds; (*e*) To stop them sucking their thumbs. *5 for each correct reason, full score 10*

3 **Fill in the missing words from the following:**
The correct way to cook green vegetables is as follows: (*a*) First ______ the greens; (*b*) Put a ______ of water into the saucepan; (*c*) Put in greens while water is ______; (*d*) Be sure the ______ is on the pan; do not cook longer than ______ minutes; (*e*) This method preserves the flavour and the ______ *Score 2 for each part of the question, full score 10*

4 **(*a*) How many yolks and how many whites are in a 1/3 packet of Dried Eggs? (*b*) How many packets are you allowed this month?** *Score 5 for each correct answer, full score 10*

PENALTY: Has Mother filled in Section A at the top of page 35 of her ration book? If not, deduct 5 from her total.

HOW CLEVER IS FATHER? *(Let the boys have a go at these also)*

1 **What is (or are) Rose Hips?**
(*a*) Name of a famous woman spy; (*b*) An Eastern Dance; (*c*) Pods of the wild rose, rich in Vitamin C; (*d*) Name of a Russian Folk Song. *Score 10*

2 **(*a*) On what days, and at what time, is the Kitchen Front Broadcast? (*b*) When does the Radio Doctor broadcast?** *5 for each correct answer, full score 10*

3 **Two of the following are provided by the Government for children under six years old. Which two?**
(*a*) cocoa; (*b*) cod liver oil; (*c*) cornflour; (*d*) tomato juice; (*e*) orange juice. *Each correct answer 5, full score 10*

4 **How much priority milk are children under six allowed?** *Score 10*

PENALTY: Did Father offer anyone some of his sweet ration this Christmas? If not, he loses 5 points from his score!

ANSWERS

FOR MOTHER AND THE GIRLS: 1-(c). 2-(b) and (d). Cod liver oil contains two important vitamins! Vitamin A, which builds up a strong resistance to infectious ailments, and Vitamin D, which is needed for strong, sturdy bodies and fine straight limbs. 3-(a) shred; (b) teacupful; (c) boiling; (d) lid; 15; (e) Vitamin C. 4-(a) 12 yolks and 12 whites—i.e. 12 whole eggs. (b) 2 for adults, 4 for green ration book holders.

FOR FATHER AND THE BOYS: 1-(c). 2-(a) Tuesday, Wednesday, Thursday and Friday at 8.15 a.m.; (b) Wednesdays at 8.15 a.m. 3-(b) and (e). 4-7 pints of milk a week for green ration book holders.

ISSUED BY THE MINISTRY OF FOOD, LONDON, W.1 FOOD FACTS No. 1??

MR. PRESIDENT

"Mr. Roosevelt." By Compton Mackenzie. (Harrap. 17s. 6d.)

By S. K. RATCLIFFE

THE Roosevelt presidency has run concurrently with the reign of Adolf Hitler. The early months of 1933 marked the lowest point of the great American Depression. At midday on March 4, when the new President delivered his Inaugural Address ("This nation calls for action, and action now"), the American people looked up again, and eight days later, on a memorable Sunday evening, they listened for the first time to the tones of combined hope and authority in a voice which was to become, with one other, the best known of all voices on the air.

The wonder is, not that the life of the President should have been written by so many hands but rather that the books about the man and his career available for the British public should be so few in number. The success of Mr. Mackenzie's, therefore, is assured. It is an animated and unqualified eulogy.

* * *

At the close of the first world war Franklin Roosevelt held a minor post in the Wilson Administration. In 1920, self-sacrificingly, he shared in a forlorn hope, being candidate for the Vice-Presidency in a campaign that was lost before the firing of the first shot. Nine months after the polling day he was stricken down. He was forty; and if he had not been a Roosevelt with all the family qualities, that would have been the end of his public life. There followed instead an heroic episode—the seven years' fight with paralysis.

Under pressure from party associates, which the Roosevelts felt to be unwise, F. D. returned to politics and was twice elected Governor of New York State. He emerged as the manifest choice of the Democratic party when, in 1932, politicians of all shades were aware that Mr. Hoover could not have a second term.

* * *

Looking back to the election of 1932 an English observer finds this fact as curious as any: that Mr. Roosevelt, whose Governorship of New York had been relatively quiet, was not generally recognised as a conspicuously able man, a citizen of high importance. For instance, the most accomplished of American publicists has not been allowed to forget that he described Governor Roosevelt as a pleasant gentleman who had a strong desire to be President. The opening moves, alike in policy and in executive action, sufficed to make the world realise that, as the Nazi clouds were gathering over Europe, the United States had come under new guidance, and was responding to a stimulus of force and freshness. The character of the Roosevelt presidency was unmistakable from its first week. Who would attempt to outline what might have happened to us all, and to North America, if the people had chosen differently in 1932 and in 1936?

* * *

The versatility of Compton Mackenzie is astonishing. There fell to him last year the task of writing the epic of Greece in its present agony. From that heart-rending theme he turns to a novel about the Home Guard, of necessity humorous, and then to the

"Landmarks." Edited by G. Rostrevor Hamilton and John Arlott. (Cambridge University Press. 8s. 6d.)

THIS, in its way, is a modern "Poly-Olbion," much easier to read than Michael Drayton's "chorographical description." Although, throughout his slow march, Drayton fitted the miles to the metre with unending courage, his work needs an anthologist. Mr. Rostrevor Hamilton and Mr. Arlott (who offer him respectful homage) have fashioned here a garland of topographical verse—"strictly concerned with the spirit or appearance of a particular place or district"—from a cluster of 180 poets between Chaucer and Betjeman. Ingeniously, they manage to cover England and Wales "*from old Belerium to the northern main*," and to miss none of the counties, plain or coloured.

* * *

Every reader with territorial loyalties will want to revise and refit, to tear down his neighbour's landmark and to erect his own. ("*What various views, what lovely landskips rise!*") This does not reflect upon the editors who have been nobly impartial. They begin with London (and the laurels of Dunbar) and find for the Thames a worthy wreath, with one leaf from Herrick: "*May all clean Nimphs and curious water Dames, With Swan-like-state flote up and down thy streams*" (a practice properly deprecated by the Port of London Authority). Beside Blake's golden vision, "The Fields from Islington," and Henley's burnished El Dorado stands Mr. John Betjeman's "Blackfriars," musty-sweet distillation of a lost Dickensian world. Elsewhere in the book Mr. Betjeman calls up for us suburban Croydon, the windy sheen of Upper Lambourne, and Trebetherick's foam-and-tamarisk-and-turf. No topographical poet can more successfully seize and fix a mood without resort to rhymed guide-bookery or metrical town-planning.

Before we leave for detailed field-work in the counties, the editors whisk us around England and Wales. Even these few pages show how much our landscape-lovers, lords of language, have depended upon the rivers. Riparans are strong in this volume, from Sir John Squire's litany of his Devon streams to Pope's "*chalky Wey, that rolls a milky wave.*"

* * *

At last we set out to a proudly-striding measure from Maurice Hewlett's "Song of the Plow." First, the Home Counties and the South and West. Examples: a Hertfordshire pastoral by Scott of Amwell, Davidson's "Romney Marsh" (poetic equivalent of a Turner?), and Barnes speaking for rural Dorset—wistful, very far away, a voice from behind a sun-set-cloud. In spite of Mr. Sassoon's "View of Old Exeter," and Sir John Squire's poem elsewhere, the Devon group is undistinguished. It is agreeable to hear the sonorous solemnities of the Regency poet, N. T. Carrington, so acutely of his period. (But where is Ernest Radford's Plymouth Sound, "*Her breast's broad welcome spreading From Mewstone to Penlee*"?)

Beyond the Tamar we greet, from the present, Mr. Rowse's April landscape, and, from the past, Swinburne's icy-ringing salute to Tintagel ("*A note that smites and sunders The hard frore* [illegible]

Meneage the Cornish pages are crowned by "Q's" "Helford River," summoning the moon-rippled calm of that hidden water with its silver flow and its sylvan shore:

Helford River, Helford River,
Blessed may ye be!
We sailed up Helford River
By Durgan from the sea.

The Isles of Scilly are missing. Why not a few lines from one of Crosbie Garstin's verses, possibly that of the Scillonian reefs, "*black-fanged and foam-drabbled, the wolves at the gate*"?

Swiftly, we pass up-along. In Gloucestershire, where Edward Thomas's train halts once more at haunted Adlestrop, the editors might have admitted six kindling lines from Flecker's "Oak and Olive" (was he not—by poetic licence—born in Gloucestershire, one of the English-men?). From two of Housman's strong enchantments—and a Mr. Churchyard on Ludlow—we move to Wales. The best here is in Wordsworth's "Snowdon" and the urbanities of Dyer's "Grongar Hill":

Ever charming, ever new,
When will the landskip tire the view!

* * *

So to the North, Mr. Herbert Palmer uttering a short curse "from an upper slum-window in Manchester" and Wordsworth overpeering the Lakes like the crest of Helvellyn. Elsewhere in the North Country the fells and dales of Yorkshire come off best, and on the sea-coast a Mr. Francis Wrangham, writing of Scarborough in 1813, opens with the surprising couplet:

In June, when May-flowers and May-flies
Paronomastically rise.

There is time only to scurry back through the Midlands, past the swelling of Redwood Anderson's Humber-tide. John Clare guards the Fens and Northamptonshire. For Suffolk there is a large dose of Crabbe's realism, and for Birmingham a smaller one of Mr. Louis MacNeice's. Rupert Brooke is for ever Cambridgeshire.

* * *

Thence, finally, to Rutland—remembering the rivers that have rushed, foamed and meandered through the pages, the unvarying adornments of the Eighteenth Century poets, and such pleasures by the way as Wilfred Rowland Childe on Oxfordshire, Mr. Edward Thompson in praise of Peterborough, John Dyer acclaiming Leeds with an unexpected comparison—

Such was the scene
Of hurrying Carthage, when the Trojan chief
First view'd her growing turrets.

—the genial doggerel of John Taylor on that "very Merrie-Wherrie-Ferry voyage," and the accommodating Victorian Muse of F. W. Faber, ready to scale Helvellyn or to apostrophize Northamptonshire, ambiguously, as "Tamest of Counties!" A companionable (and well-produced) book, contenting and contentious. The arguments it will raise are nothing to what the Editors may expect if they begin on Scotland.

SAINTS' DAYS

"The Eagle and the Dove." By V. Sackville-West. (Michael Joseph. 10s. 6d.)

By SIMON HARCOURT-SMITH

THE general problem of hagiology can no longer be dismissed with the cocksure derision of the Voltairean noonday. Phenomena which your pragmatist considered mumbo-jumbo a century ago, have lately got new authority from Jung and Freud, and from our growing knowledge of Yoga. But rarely does one come upon a dispassionate study of sainthood. The subject is generally left to the believer or the sceptic, one as inflexible and intolerant as the other. For that reason alone Miss Sackville-West's admirable and balanced study of the two Carmelite saints who bore the same Christian name—S. Teresa of Avila (1515-1582) and S. Thérèse de Lisieux 1873-1897)—is warmly to be welcomed.

Her essays on the noble Spaniard and the sentimental French bourgeoise are preceded by an erudite and fascinating disquisition on sanctity, and some of the physical manifestations—stigmata, levitation, and "incendium amoris" for instance—that often accompany it.

* * *

Teresa de Cepeda Davila y Ahumada belonged to an extremely noble family, from that stern, splendid Castilian town of Avila de los Caballeros—the Spain, as Miss Sackville-West points out, not of flowers and soft music but of cruel winds and wild fervours. Entering a Carmelite establishment, under the guilt of a passion which she and her family agreed, not perhaps unnaturally, in thinking shameful, she fell a prey to visions. The devils who tormented her, the noxious serpents crawling through the slime of Hell, might have been imagined by Jerome Bosch, a painter already much honoured in Spain. And in such a connection as this Miss Sackville-West raises the issue whether the phenomenon of divine visions could occur to someone who had never heard of God?

Be that as it may, Teresa, far from seeking the visions, was acutely embarrassed by them, and by her widely attested tendency to levitate. On occasions her Sisters in God were compelled almost to sit upon her to keep her body on the ground. The visions convinced her that she had been charged with a great mission. Founding the order of the Descalzos or "Barefooted" in opposition to the Calzados or "Shod," she gradually brought the Carmelite Order back to the new austerities prescribed by the Council of Trent.

She was moreover an accomplished writer and a great lady of spirit. Her "Interior Castle" is one of the splendours of Spanish XVIth century prose; and in her dealings with the Holy Family she allowed herself all the caprices of her renounced position in the great world. Occasionally her pious humility would be broken by an exasperated, admonitory cry. How could God, she would ask, expect to have many adorers when He treated His friends so badly? Look what had happened to His Son. . . .

* * *

The case of Teresa of Avila, as

MR. PRESIDENT

"Mr. Roosevelt." By Compton Mackenzie. (Harrap. 17s. 6d.)

By S. K. RATCLIFFE

THE Roosevelt presidency has run concurrently with the reign of Adolf Hitler. The early months of 1933 marked the lowest point of the great American Depression. At midday on March 4, when the new President delivered his Inaugural Address ("This nation calls for action, and action now"), the American people looked up again, and eight days later, on a memorable Sunday evening, they listened for the first time to the tones of combined hope and authority in a voice which was to become, with one other, the best known of all voices on the air.

The wonder is, not that the life of the President should have been written by so many hands but rather that the books about the man and his career available for the British public should be so few in number. The success of Mr. Mackenzie's, therefore, is assured. It is an animated and unqualified eulogy.

***

At the close of the first world war Franklin Roosevelt held a minor post in the Wilson Administration. In 1920, self-sacrificingly, he shared in a forlorn hope, being candidate for the Vice-Presidency in a campaign that was lost before the firing of the first shot. Nine months after the polling day he was stricken down. He was forty; and if he had not been a Roosevelt with all the family qualities, that would have been the end of his public life. There followed instead an heroic episode—the seven years' fight with paralysis.

Under pressure from party associates, which the Roosevelts felt to be unwise, F. D. returned to politics and was twice elected Governor of New York State. He emerged as the manifest choice of the Democratic party when, in 1932, politicians of all shades were aware that Mr. Hoover could not have a second term.

***

Looking back to the election of 1932 an English observer finds this fact as curious as any: that Mr. Roosevelt, whose Governorship of New York had been relatively quiet, was not generally recognised as a conspicuously able man, a citizen of high importance. For instance, the most accomplished of American publicists has not been allowed to forget that he described Governor Roosevelt as a pleasant gentleman who had a strong desire to be President. The opening moves, alike in policy and in executive action, sufficed to make the world realise that, as the Nazi clouds were gathering over Europe, the United States had come under new guidance, and was responding to a stimulus of force and freshness. The character of the Roosevelt presidency was unmistakable from its first week. Who would attempt to outline what might have happened to us all, and to North America, if the people had chosen differently in 1932 and in 1936?

***

The versatility of Compton Mackenzie is astonishing. There fell to him last year the task of writing the epic of Greece in its present agony. From that heart-rending theme he turns to a novel about the Home Guard, of necessity humorous, and then to the

LANDSCAPE ARTISTS

By J. C. TREWIN

"Landmarks." Edited by G. Rostrevor Hamilton and John Arlott. (Cambridge University Press. 8s. 6d.)

THIS, in its way, is a modern "Poly-Olbion," much easier to read than Michael Drayton's "chorographical description." Although, throughout his slow march, Drayton fitted the miles to the metre with unending courage, his work needs an anthologist. Mr. Rostrevor Hamilton and Mr. Arlott (who offer him respectful homage) have fashioned here a garland of topographical verse—"strictly concerned with the spirit or appearance of a particular place or district"—from a cluster of 180 poets between Chaucer and Betjeman. Ingeniously, they manage to cover England and Wales "from old *Belerium to the northern wave,*" and to miss none of the counties, plain or coloured.

***

The case of Teresa of Avila, as

most vital of Presidents. The skilled novelist's pen stands him in good stead for all the picturesque stages of his hero's activities, and he lays claim to full consistency over a period of thirty years. All the President's State papers have been published, together with a verbatim transcript of extempore utterances. What other statesman of the time could stand this test? The book is wholly personal. Mr. Mackenzie has not included even a brief summary of the New Deal. He does not indicate the character and scope of the anti-Roosevelt forces. His record is brought down only to the Lease-Lend Act in 1941. This is a fault of proportion. The Roosevelt family is given a good show. The illustrations are profuse and delightful. Mr. Mackenzie is careful over details; but like nearly all English writers, and too many Americans, he copies incorrectly the key sentence of the Declaration of Independence.

UGLY DUCKLING

"The Shoemaker's Son." By Constance Buel Burnett. (Harrap, 10s. 6d.)

By MARY CROSBIE

HANS ANDERSEN'S story of "The Ugly Duckling" had an autobiographical flavour. At all events it is used here as a background for biography. Mrs. Burnett writes with sympathy and more than a touch of Andersen's naive charm. Her book is a little difficult to place. Mature and critical readers would ask for more depth, more severity in analysis. Its best appeal might be to an imaginative child of twelve or fourteen, who is just coming to know the romance of reality. It seems to move (and this is part of its charm) in a fairy-tale world of snow and stars and ugly ducklings who become swans, as it traces the life of the clumsy, untaught, grotesque country lad who was to find fame in a fashion he never intended. His poetic dramas, which he tried so confidently to thrust on a critical world, are forgotten. His fairy tales, which were a by-product, are immortal. Mrs. Burnett has a skilful, though slight, touch in characterisation. Hans Christian and his friends, especially the sensible, steady Collin family, come pleasantly to life.

VANISHED WORLD

"The World of Yesterday." By Stefan Zweig. (Cassell. 15s.)

STEFAN ZWEIG covers almost the whole of his career, from the 1880's to the outbreak of the present war—two years before he took his own life. The book, less an autobiography than a story of his times, is history strictly from his own point of view, or, as he puts it, with himself as the "pivotal point."

He gives us an excellent sociological sketch of the well-to-do bourgeoisie in Central Europe at the turn of the century: the prosperity and contentment of the older generation, the problems, ideas, and troubles of the younger—his contemporaries — in Imperial Vienna. Then, with his wanderings through the Continent, the great figures in art and literature appear before us as he meets them: Rilke, Rodin, Verhaeren, Roman Rolland, Max Reinhardt, and many others. Zweig draws a vivid picture of the first years of the last war in Austria. Fortunate enough to spend the later part of the war in neutral Switzerland, he tells how he joined there the band of those intellectuals from all countries who tried and worked for peace and international understanding. There are observations—some of them very shrewd—on the post-war chaos in Central Europe and on the ascent of Nazism and the fate of its victims.

***

What is really the "world of yesterday"? Zweig hardly meant 1939 to be the borderline between yesterday and to-day. It may be 1914, the end of what he calls the age of security, that golden age of the artist, humanist, intellectual, connoisseur, and cosmopolite of whom Zweig pictures himself as the embodiment. Or, again, it may be 1933, the year of Hitler's advent, in which Zweig became an exile from his native Austria and the German-speaking world. More than one remark of his leads us to suppose that he felt his own world collapse when he saw his work banned in those countries where the very instrument of his art—the German language—was best understood. Like a painter whose pictures can be given to the world only in black-and-white reproduction, he was forced to approach most of his readers through the medium of translations.

***

All this indicates the essentially egocentric character of the book. Nevertheless, Zweig has lived through so much that his account is extremely interesting, indeed absorbing. It will give to the ordinary reader an exciting and—even in the translation—a well-written chronicle, and the student of history may find in it valuable material.

W. G.

put in this book, seems to justify much in the way of mortifications and egocentric exercises which the layman might find somewhat repellent. The object of all artists after all is to reach the ultimate truth. Such a mystic as S. Teresa may well have found the short cut to it. It is hard to say the same for S. Thérèse de Lisieux. She of Avila had talked of Our Lord as "His Majesty." She of Lisieux might almost have been imagined by Barrie, with her sugary diminutives, her jargon of "little flowers," the "little Virgin," the "little child Jesus," and she his "little spiritual wife, Thérèse Martin." Nevertheless she possessed qualities of outstanding virtue, and numerous miracles performed by her have been formally attested.

New Novels

By NORMAN COLLINS

Headaches In Whitehall

"Comedy in Chains." By Dennis Gray Stoll. (Gollancz. 7s. 6d.)
"Pemberton." By David Footman. (Cresset Press. 7s. 6d.)
"The Lautensack Brothers." By Lion Feuchtwanger. (Hamish Hamilton. 9s.)
"Beyond Terror." By Jack Lindsay. (Andrew Dakers. 9s. 6d.)
"Grig in Retirement." By H. B. Creswell. (Faber and Faber. 9s. 6d.)
"An Eye for a Tooth." By Dornford Yates. (Ward Lock. 9s. 6d.)

THE difficulty of writing a novel about Anglo-India is rather like that of writing a play about a wild duck—it has been done uncommonly well before.

But, after Mr. E. M. Forster, le *déluge*. And in this downpour Mr. Dennis Stoll's "COMEDY IN CHAINS" is one of the very brightest spots. The book is clever, biting and well written. And earnestly intentioned. Altogether, it is the sort of thing which senior officials at the India Office may, in the words of their junior colleagues, find a bit of a headache.

Not that it is lop-sided, even though it is Left-sided. It is very far from being a crude study in black and white, with all the colours in reverse. The principal character — an Oxford-educated Eurasian doctor supplies the finer shades of feeling as of colour, and there are plenty of shadows in the purely Indian scene. Admittedly the English Deputy Collector is a nasty piece of work. That, however, is as much Mr. Stoll's fault as the Deputy Collector's. He is a type rather than a character, and might have been bought cut-rate from any novel-writing agency. But he is also a warning. Caught up in the caste system of the British *raj*, he is an Unteachable striving to govern the Untouchable.

***

Mr. Footman's "PEMBERTON" is another Whitehall headache—in the Foreign Office this time. It is an annihilating picture of a minor Legation in the Balkans in the early days of the war, drawn either second-hand from memory or first-hand from a thunderingly good imagination. I found everything from the Vuchinian Legation staff—a beautiful collection of maliciously discerning portraits—to the local Tabarin with its very dubious *atrakcioni*, thoroughly convincing. I have one quarrel. Fancy names for imaginary countries are all right in musical comedy but, in more serious stuff, they blow the gaff completely. Ruritania, yes; but Vuchinia, no. Otherwise the novel is excellent—neat, expert and with the moral on top of you before you notice it.

Mr. Feuchtwanger goes back to the causes of things and shows us pre-war Nazi Germany. It is not one of his best novels—the Lautensack Brothers don't live in the same street as the Oppermanns—but it should be read by anyone, whether detained under 18B or not, who may still have a lingering belief in the orderliness and discipline of the Totalitarian system. Here is a cross section of the foundations—the superstition, the feuds, the jealousies, the hysteria, the sheer gullible *silliness*. There remains the nice question of whether living persons should be introduced into fiction. On this evidence, I am doubtful. The chapters in which Hitler appears seem to me to distort the novel without enriching it. They are all sound and Fuhrer, signifying nothing.

***

In "BEYOND TERROR," Mr. Jack Lindsay provides the sort of excitement which perhaps comes over better at 3s. 6d. in the stalls. The scene is Crete: the date, 1941. As a super-spectacle it has everything: massed air invasion, bombings, close-ups of tough-guy Imperial soldiery, terrorised inhabitants, guerrilla bands in the hills, and a tortured love idyll culminating on a mountainside. The writing . . . but what has writing got to do with this kind of entertainment?

Mr. H. B. Creswell has achieved what every novelist would like to do—he has created a character. Mr. Grigblay, builder, is an authentic bit of pawky Old England, and he carries the best wishes of all of us with him into his retirement. But really, the last instalment of his life is a very odd affair. It is half *belles-lettres*, and half builder's text-book. There is even a glossary for the unapprenticed like myself who are a bit hazy about such things as grouts, muntins, purlins, oversailings, skewbacks, and undercloaks.

Mr. Dornford Yates has dedicated his new adventure story to you and me, dear reader. This is how his inscription runs: "To the British—the same yesterday, to-day and forever, the finest fighting material in the world." Well, I call that pretty handsome of Mr. Yates. I was only a bit taken aback after that to learn from the blurb that "AN EYE FOR A TOOTH" has "nothing to do with wars or rumours of war." But it is the blurb that is right. All quiet, in fact; just murders and blackmail.

FOR THE TOKENS

BOOKS arriving too late for ordinary pre-Christmas review, but suitable for the Book Token List to be used when the shops reopen, include **"Drawn and Quartered,"** by Charles Addams (Hamish Hamilton, 12s. 6d.). Mr. Addams is a *New Yorker* artist, and has the true sinister gaiety and lurid, preposterous fantasy of that school. He deals in men, monsters, madness, and riotous, spooky humour. Just the book for those who can't bear another minute of quiet, English vicarage-garden, *Punch*-at-its-seemliest fun.

Four King Penguins, at two shillings each, are an obvious treasure, if found. The make-up and illustration in colour of these books are a miracle at the price and the text has quality, too. New volumes are **"The Bayeux Tapestry,"** by Sir Eric Maclagan; **"A Book of Lilies,"** by Fred Stoker; **"Fishes of Britain's Rivers and Lakes,"** by J. R. Norman; and **"The Poets' Corner,"** two dozen Max Beerbohm cartoons, with an Introduction by John Rothenstein.

"This is the day (writes Alison Settle) on which, with a pained intake of the breath, we say, "Goodness! How could I have forgotten them! And they have sent me a Most Expensive Calendar." The appearance of **"Those Little Ones,"** by Mavis Axtell (Alliance Press, 2s. 6d.), will now solve many problems. It has a gay cover and excellent print, costs only half-a-crown, concerns the doings and sayings of small people in a wartime nursery, and devotes exactly as many pages to delightful photographs of babies and children in action as it does to the engaging text.

***

"For Ever England" (Cassell, 9s. 6d.) is a patriotic anthology. Mr. Collie Knox has collected many of the famous things said and written about the country, and he has added a section largely of new material by eminent contributors. Throughout we hear the note of the battle-order at Crécy: "Advance banners! Saint George for England!"

most vital of Presidents. The skilled novelist's pen stands him in good stead for all the picturesque stages of his hero's activities, and he lays claim to full consistency over a period of thirty years. All the President's State papers have been published, together with a verbatim transcript of extempore utterances. What other statesman of the time could stand this test? The book is wholly personal. Its best appeal might be to an imaginative child of twelve or fourteen, who is just coming to know the romance of reality. It seems to move (and this is part of its charm) in a fairy-tale world of snow and stars and ugly ducklings who become swans, as it traces the life of the clumsy, untaught, grotesque country lad who was to find fame in a fashion he never intended. His poetic dramas, which he tried so confidently to thrust on a critical world, are forgotten. His fairy tales, which were a by-product, are immortal. Mrs. Burnett has a skilful, though slight, touch in characterisation. Hans Christian and his friends, especially the sensible, steady Collin family, come pleasantly to life.

VANISHED WORLD

"The World of Yesterday." By Stefan Zweig. (Cassell, 15s.)

STEFAN ZWEIG covers almost the whole of his career, from the 1880's to the outbreak of the present war—two years before he took his own life. The book, less an autobiography than a story of his times, is history strictly from his own point of view, or, as he puts it, with himself as the "pivotal point."

He gives us an excellent sociological sketch of the well-to-do bourgeoisie in Central Europe at the turn of the century: the prosperity and contentment of the older generation, the problems, ideas, and troubles of the younger—his contemporaries — in Imperial Vienna. Then, with his wanderings through the Continent, the great figures in art and literature appear before us as he meets them. Rilke, Rodin, Verhaeren, Romain Rolland, Max Reinhardt, and many others. Zweig draws a vivid picture of the first years of the last war in Austria. Fortunate enough to spend the later part of the war in neutral Switzerland, he tells how he joined there the band of those intellectuals from all countries who tried and worked for peace and international understanding. There are observations—some of them very shrewd—on the post-war chaos in Central Europe and on the ascent of Nazism and the fate of its victims.

***

What is really the "world of yesterday"? Zweig hardly meant 1939 to be the borderline between yesterday and to-day. It may be 1914, the end of what he calls the age of security, that golden age of the artist, humanist, intellectual, connoisseur, and cosmopolite of whom Zweig pictures himself as the embodiment. Or, again, it may be 1933, the year of Hitler's advent, in which Zweig became an exile from his native Austria and the German-speaking world. More than one remark of his leads us to suppose that he felt his own world collapse when he saw his work banned in those countries where the very instrument of his art—the German language—was best understood. Like a painter whose pictures can be given to the world only in black-and-white reproduction, he was forced to approach most of his readers through the medium of translations.

***

All this indicates the essentially egocentric character of the book. Nevertheless, Zweig has lived through so much that his account is extremely interesting, indeed absorbing. It will give to the ordinary reader an exciting and—even in the translation—a well-written chronicle, and the student of history may find in it valuable material.

W. G.

put in this book, seems to justify much in the way of mortifications and egocentric exercises which the layman might find somewhat repellent. The object of all artists after all is to reach the ultimate truth. Such a mystic as S. Teresa may well have found the short cut to it. It is hard to say the same for S. Thérèse de Lisieux. She of Avila had talked of Our Lord as "His Majesty." She of Lisieux might almost have been imagined by Barrie, with her sugary diminutives, her jargon of "little flowers," the "little Virgin," the "little child Jesus," and she his "little spiritual wife, Thérèse Martin." Nevertheless she possessed qualities of outstanding virtue, and numerous miracles performed by her have been formally attested.

New Novels

By NORMAN COLLINS

Headaches In Whitehall

"Comedy in Chains." By Dennis Gray Stoll. (Gollancz, 7s. 6d.)
"Pemberton." By David Footman. (Cresset Press, 7s. 6d.)
"The Lautensack Brothers." By Lion Feuchtwanger. (Hamish Hamilton, 9s.)
"Beyond Terror." By Jack Lindsay. (Andrew Dakers, 9s. 6d.)
"Grig in Retirement." By H. B. Creswell. (Faber and Faber, 9s. 6d.)
"An Eye for a Tooth." By Dornford Yates. (Ward Lock, 9s. 6d.)

THE difficulty of writing a novel about Anglo-India is rather like that of writing a play about a wild duck—it has been done uncommonly well before.

But, after Mr. E. M. Forster, le déluge. And in this downpour Mr. Dennis Stoll's "COMEDY IN CHAINS" is one of the very brightest spots. The book is clever, biting and well written. And earnestly intentioned. Altogether, it is the sort of thing which senior officials at the India Office may, in the words of their junior colleagues, find a bit of a headache.

Not that it is lop-sided, even though it is Left-sided. It is very far from being a crude study in black and white, with all the colours in reverse. The principal character — an Oxford-educated Eurasian doctor supplies the finer shades of feeling as of colour, and there are plenty of shadows in the purely Indian scene. Admittedly the English Deputy Collector is a nasty piece of work. That, however, is as much Mr. Stoll's fault as the Deputy Collector's. He is a type rather than a character, and might have been bought cut-rate from any novel-writing agency. But he is also a warning. Caught up in the caste system of the British raj, he is an Unteachable striving to govern the Untouchable.

***

Mr. Footman's "PEMBERTON" is another Whitehall headache—in the Foreign Office this time. It is an annihilating picture of a minor Legation in the Balkans in the early days of the war, drawn either second-hand from memory or first-hand from a thunderingly good imagination. I found everything from the Vuchinian Legation staff—a beautiful collection of maliciously discerning portraits—to the local Tabarin with its very dubious *atrakcioni*, thoroughly convincing. I have one quarrel. Fancy names for imaginary countries are all right in musical comedy but, in more serious stuff, they blow the gaff completely. Ruritania, yes; but Vuchinia, no. Otherwise the novel is excellent—neat, expert and with the moral on top of you before you notice it.

Mr. Feuchtwanger goes back to the causes of things and shows us pre-war Nazi Germany. It is not one of his best novels—the Lautensack Brothers don't live in the same street as the Oppermanns—but it should be read by anyone, whether detained under 18B or not, who may still have a lingering belief in the orderliness and discipline of the Totalitarian system. Here is a cross section of the foundations—the superstition, the feuds, the jealousies, the hysteria, the sheer gullible silliness. There remains the nice question of whether living persons should be introduced into fiction. On this evidence, I am doubtful. The chapters in which Hitler appears seem to me to distort the novel without enriching it. They are all sound and Fuhrer, signifying nothing.

***

In "BEYOND TERROR," Mr. Jack Lindsay provides the sort of excitement which perhaps comes over better at 3s. 6d. in the stalls. The scene is Crete: the date, 1941. As a super-spectacle it has everything: massed air invasion, bombings, close-ups of tough-guy Imperial soldiery, terrorised inhabitants, guerrilla bands in the hills, and a tortured love idyll culminating on a mountainside. The writing . . . but what has writing got to do with this kind of entertainment?

Mr. H. B. Creswell has achieved what every novelist would like to do—he has created a character. Mr. Grigblay, builder, is an authentic bit of pawky Old England, and he carries the best wishes of all of us with him into his retirement. But really, the last instalment of his life is a very odd affair. It is half *belles-lettres*, and half builder's text-book. There is even a glossary for the unapprenticed like myself who are a bit hazy about such things as grouts, muntins, purlins, oversailings, skewbacks, and undercloaks.

Mr. Dornford Yates has dedicated his new adventure story to you and me, dear reader. This is how his inscription runs: "To the British—the same yesterday, to-day and forever, the finest fighting material in the world." Well, I call that pretty handsome of Mr. Yates. I was only a bit taken aback after that to learn from the blurb that "AN EYE FOR A TOOTH" has "nothing to do with wars or rumours of war." But it is the blurb that is right. All quiet, in fact: just murders and blackmail.

FOR THE TOKENS

BOOKS arriving too late for ordinary pre-Christmas review, but suitable for the Book Token List to be used when the shops reopen, include **"Drawn and Quartered,"** by Charles Addams (Hamish Hamilton, 12s. 6d.). Mr. Addams is a *New Yorker* artist, and has the true sinister gaiety and lurid, preposterous fantasy of that school. He deals in men, monsters, madness, and riotous, spooky humour. Just the book for those who can't bear another minute of quiet, English vicarage-garden, *Punch*-at-its-seemliest fun.

Four King Penguins, at two shillings each, are an obvious treasure, if found. The make-up and illustration in colour of these books are a miracle at the price and the text has quality, too. New volumes are **"The Bayeux Tapestry,"** by Sir Eric Maclagan, **"A Book of Lilies,"** by Fred Stoker, **"Fishes of Britain's Rivers and Lakes,"** by J. R. Norman, and **"The Poets' Corner,"** two dozen Max Beerbohm cartoons, with an Introduction by John Rothenstein.

This is the day (writes Alison Settle) on which, with a pained intake of the breath, we say, "Goodness! How could I have forgotten them! And they have sent me a Most Expensive Calendar." The appearance of **"Those Little Ones,"** by Mavis Axtell (Alliance Press, 2s. 6d.), will now solve many problems. It has a gay cover and excellent print, costs only half-a-crown, concerns the doings and sayings of small people in a wartime nursery, and devotes exactly as many pages to delightful photographs of babies and children in action as it does to the engaging text.

***

"For Ever England" (Cassell, 9s. 6d.) is a patriotic anthology. Mr. Collie Knox has collected many of the famous things said and written about the country, and he has added a section largely of new material by eminent contributors. Throughout we hear the note of the battle-order at Crécy: "Advance banners! Saint George for England!"

NEXT YEAR

"THIS is a war of people and of ideas," said Mr. Churchill in 1940. His phrase is as pertinent as ever as we face the fierce challenges of 1944. We have been engaged in a double fight all the time. It was, and is, Britain against Germany. It also was, and is, Democracy against Tyranny. The war of people we are now sure to win. The war of ideas we may still lose, unless we are faithful and vigilant. Germany will lose the war without doubt. Will Fascism? It would be rash to say so with assurance. The year 1944 demands the double victory, victory of arms and victory of principle.

Certainly, the name of Fascism will vanish from European politics for a time. To be called a Fascist or Nazi will soon be an actionable insult for any active politician anywhere. Even the blackest tyranny will shun these discredited trade-marks like pestilence.

But we are not fighting to erase a name. We are fighting to eradicate an evil thing. The thing, tyranny, may still reassert itself under any other name; perhaps even—why not?—under the name of democracy. One can every day meet ardent "democrats" who thunder against what they call out-of-date party politics, who cry for purges and the outlawry of their opponents, who revel in the most militant nationalism and look eagerly forward to "taking leaves from Hitler's book" on the persecution or deportation of racial and national minorities. Unless we recognise these people in time for what they are, democracy may still have lost its battle against tyranny in Europe, even though Britain will have won her war against Germany.

The danger of Fascism—the thing and not the name—remains formidable. The very progress of our technical age favours this particularly loathsome form of scientific tyranny; it provides it with the means to engineer and manipulate mass emotions and to hunt down and destroy these individuals who resist its "propaganda." Greater vigilance and sterner resolve are needed in the twentieth century than in any former time if popular government and free institutions are not to perish.

Moreover, the soil is to-day everywhere in Europe prepared for the seed of poison that corrupted the soul of Germany and Italy. Fascism thrives on national defeat and humiliation, and on the vengeful passions which they arouse. Europe after this war will be full of such seeding-beds for Fascist fury.

Here is a danger not only to the happiness of the long tormented peoples of Europe; it is a danger—distant, perhaps, but clearly perceptible—to our own peace and safety. As Aristotle said, the end of tyranny is war. History has amply proved the truth of his adage; British history in particular shows that we have never enjoyed lasting peace while Continental tyranny flourished at our doorstep. And if we are sometimes taunted as "perfidious Albion" for changing our national alliances, we may boast our unchangeable

A TIME FOR LITTLENES[S]

By IVOR BROWN

IT must have been frequently pointed out, though it is perhaps insufficiently remembered, that the Christmas story delivers a powerful snub to the admirers of capital cities and Babylonian majesties and to all persons and places that exult in pomp and magnitude. Jesus, it says, was born in a village. He was killed in the capital. Everything about that story stresses the immense and everlasting significance of all people and things commonly deemed to be insignificant.

The scene is one of the smallest, "merest" provinces of the mighty Roman Empire and not even its chief town. The hero is a babe, the home is in a hamlet, the father a small craftsman, the birthplace an outhouse of the inn in another hamlet. It is not a tale of two cities, not even of "one-horse towns"; say rather of one-ass villages, for no creature so large and lordly as a horse was the means of transportation in this tremendous saga of the tiny.

BLESSINGS OF DISSENT

From these minute beginnings came that which challenged and in part defeated the bulkiest, most confident, and wealthiest of material powers, Rome. Rome, in turn, conquered its conqueror, as many think who agree with the famous aphorism of Hobbes. "The Papacy is not other than the Ghost of the deceased Roman Empire sitting crowned upon the grave thereof."

The spiritual imperialism of the Papacy re-established the sovereignty of size. The idea of a single Christian community is certainly an attractive vision, but since so many men have a natural and indestructible impulse for freedom of conscience and of thought, it can only be established on a basis of toleration unlikely ever to be acceptable to the authoritarians of Rome. Dissent, whether secular or religious, is one of the natural activities and pleasures of mankind and a world without difference and discussion would be a world of atrophy, drowsy with the slow fevers of decay. Does agreement to differ, unity in dissent, mean chaos come again and come to stay, the "terrible state of chassis" lamented by O'Casey's Paycock? Here lies, more obviously than ever, the problem of the twentieth century, whose second half will have to resolve this conflict of the small and great or see the final failure of man's curious adventure upon earth. He has struggled down some thousands of blood-poisoned years to turn the life that is "nasty, brutish, and short" into one that is social, civilised, secure, and long. Often he has seemed victorious over force and folly, but only for a short while.

In a way everything seems now to be on the side of size. The small can only hope to survive by merging with the large. Scientific and mechanical progress have made nonsense of the vaunted independence of small communities. There was a time when the brawn and brain and gallantry of a few could hold the [illegible] look on the sea, but bombers and air-borne troops look down on both and make a farce of frontiers. It is idle to talk of national independence without four indispensable foundations for it, a large population, ample raw materials, abundant engineering power, and high technical skill. The sovereignty of small or pastoral States is now a phrase, an echo of dead yesterdays, drifting off the old platforms of good intention.

But that is nothing to regret. The fact that communities must coalesce for safety, joining either in Federations or sinking their material forces in super-national combines, possibly at last in one World State, need not in the least destroy what the Irish poet George Russell called "the National Being." By that he meant far more than armies and taxes; he meant the character, the culture, the difference whereby States are mentally nourished, wherein they have pride and pleasure. It was surprising that no Frenchman (considering the French reputation for logic) welcomed the Smutsian comments on the passing of France as a Great Power. While the English Francophiles were abashed and muttering, "Oh, I say, Sir, not quite good form," rather as though the great General had gone to the Eton and Harrow match in a bowler hat and brown boots, it would have been delightful, and it would also have been timely and sensible had a Frenchman said quietly, "France, whether great or small, will contribute its share of defence and its loyalty of purpose to the new Community of Europe (or the World) which alone can guarantee peace. This Great Power business is a suicidal sport, as we, most of all, ought to know. In 1920 we were the Greatest Power in Europe: what did it avail and where are we now? France is not envious of the Versailles legacy. It will remain happily itself in custom, culture, language, arts, amenities, whatever its Power-status. That is what matters to civilised men. In essentials all sane people are happy to be small, for they know that this is truly to be great."

WHEN FREEDOM SHRIEKS

A time for littleness! That is the corollary of the Age of Size. Mr. Agar has called this a time for greatness, and the Primate has paid tribute to the notable phrase in his Christmas message. But Christmas is also the feast of domestic and even diminutive things. So, as our society becomes safer through coalescence and therefore through size, which it essentially must, and as science and machinery unify and assimilate the human groups, which they inevitably do, we must make it a main concern of social policy somehow to preserve the little freedoms along with the large advantages and to see that the odd type, the lonely figure, the dissident, the refugee are able to maintain themselves within the fabric of the new and huge society.

A TIME FOR LITTLENESS

By IVOR BROWN

IT must have been frequently pointed out, though it is perhaps insufficiently remembered, that the Christmas story delivers a powerful snub to the admirers of capital cities and Babylonian majesties and to all persons and places that exult in pomp and magnitude. Jesus, it says, was born in a village. He was killed in the capital. Everything about that story stresses the immense and everlasting significance of all people and things commonly deemed to be insignificant.

The scene is one of the smallest, "merest" provinces of the mighty Roman Empire and not even its chief town. The hero is a babe, the home is in a hamlet, the father a small craftsman, the birthplace an outhouse of the inn in another hamlet. It is not a tale of two cities, not even of "one-horse towns"; say rather of one-ass villages, for no creature so large and lordly as a horse was the means of transportation in this tremendous saga of the tiny.

BLESSINGS OF DISSENT

From these minute beginnings came that which challenged and in part defeated the bulkiest, most confident, and wealthiest of material powers, Rome. Rome, in turn, conquered its conqueror, as many think who agree with the famous aphorism of Hobbes. "The Papacy is not other than the Ghost of the deceased Roman Empire sitting crowned upon the grave thereof."

The spiritual imperialism of the Papacy re-established the sovereignty of size. The idea of a single Christian community is certainly an attractive vision, but since so many men have a natural and indestructible impulse for freedom of conscience and of thought, it can only be established on a basis of toleration unlikely ever to be acceptable to the authoritarians of Rome. Dissent, whether secular or religious, is one of the natural activities and pleasures of mankind and a world without difference and discussion would be a world of atrophy, drowsy with the slow fevers of decay. Does agreement to differ, unity in dissent, mean chaos come again and come to stay, the "terrible state of chassis" lamented by O'Casey's Paycock? Here lies, more obviously than ever, the problem of the twentieth century, whose second half will have to resolve this conflict of the small and great or see the final failure of man's curious adventure upon earth. He has struggled down some thousands of blood-poisoned years to turn the life that is "nasty, brutish, and short" into one that is social, civilised, secure, and long. Often he has seemed victorious over force and folly, but only for a short while.

In a way everything seems now to be on the side of size. The small can only hope to survive by merging with the large. Scientific and mechanical progress have made nonsense of the vaunted independence of small communities. There was a time when the brawn and brain and gallantry of a few could hold the pass against [illegible] look on the sea, but bombers and air-borne troops look down on both and make a farce of frontiers. It is idle to talk of national independence without four indispensable foundations for it, a large population, ample raw materials, abundant engineering power, and high technical skill. The sovereignty of small or pastoral States is now a phrase, an echo of dead yesterdays, drifting off the old platforms of good intention.

But that is nothing to regret. The fact that communities must coalesce for safety, joining either in Federations or sinking their material forces in super-national combines, possibly at last in one World State, need not in the least destroy what the Irish poet George Russell called "the National Being." By that he meant far more than armies and taxes: he meant the character, the culture, the difference whereby States are mentally nourished, wherein they have pride and pleasure. It was surprising that no Frenchman (considering the French reputation for logic) welcomed the Smutsian comments on the passing of France as a Great Power. While the English Francophiles were abashed and muttering, "Oh, I say, Sir, not quite good form," rather as though the great General had gone to the Eton and Harrow match in a bowler hat and brown boots, it would have been delightful, and it would also have been timely and sensible had a Frenchman said quietly, "France, whether great or small, will contribute its share of defence and its loyalty of purpose to the new Community of Europe (or the World) which alone can guarantee peace. This Great Power business is a suicidal sport, as we, most of all, ought to know. In 1920 we were the Greatest Power in Europe: what did it avail and where are we now? France is not envious of the Versailles legacy. It will remain happily itself in custom, culture, language, arts, amenities, whatever its Power-status. That is what matters to civilised men. In essentials all sane people are happy to be small, for they know that this is truly to be great."

WHEN FREEDOM SHRIEKS

A time for littleness! That is the corollary of the Age of Size. Mr. Agar has called this a time for greatness, and the Primate has paid tribute to the notable phrase in his Christmas message. But Christmas is also the feast of domestic and even diminutive things. So, as our society becomes safer through coalescence and therefore through size, which it essentially must, and as science and machinery unify and assimilate the human groups, which they inevitably do, we must make it a main concern of social policy somehow to preserve the little freedoms along with the large advantages and to see that the odd type, the lonely figure, the dissident, the refugee are able to maintain themselves within the fabric of the new and huge society.

There is a school, small but outspoken, of anti-mechanists who believe that [illegible] delicate fingers of the craftsman. Thomas Campbell once announced in a famous line that "Freedom shrieked when Kosciusko fell," and some now appear to believe that poor Freedom yelled when Henry Ford arose and has been screaming ever since. The Distributists also, and the devotees of the Small Shop, can bring their Rousseau up to date by announcing that man was born free, but everywhere he is in chain-stores. Others would recapture the fabled merriment of old England by putting the hand to the sickle, the ox to the plough, though whether any actual farm-labourers would feel merrier for being medievally rid of modern tractors is a matter for question. Machines can in fact be great liberators, and many an urban worker enjoys the freedom of the hills and dales conferred by a motor-bicycle more than he relishes the somewhat elusive political liberties conferred by a vote.

CASE OF THE SCHOOLS

The problem, of course, can be made to look insoluble. For example, if we have a large number of small, independent schools, we may have some which are very bad. If, however, we clamp them all into one State-organised, State-inspected, State-unified system, we may get none which is very good. Size and system make for medium standards, efficiency without excellence. Efficiency we must have: excellence we sorely need. Therefore, in every great act of social reconstruction it should be a matter of high concern always to see that we leave room for the exceptional, while we toil at improving the average. The century of size and assimilation must also be the epoch of the unique, the nonconforming, the experimental. The World State will be intolerable unless we retain our loyalty to the suburb and the parish, and the best of the cosmopolites may well be he whose heart bleeds, even unto pernicious anaemia, over a game lost upon the village green.

But let that pass. We have got to find room inside our great society for the rebel and the recluse, for the independent spirit and the alone-standing man, and it can be done if we mean it. Just as super-nationalism, so necessary for man, can live with a full and flourishing cultural nationalism, so the services of Big Industry, which can be real services in providing cheapness and abundance, must never crush out the quality and character of the individual craftsman, artist, and merchant. In solving the social equation of the big and small units, both among nations and inside them, lies the primary problem of twentieth century Politics. This is a dilemma which every sensitive or reflective person must often and acutely feel. The world must be made one, and yet the singleton must somehow exist freely and happily within it. The "odd man out" must become the odd man in. Christmas with its reminder alike of the smallest and greatest, the Infinite and the infinitesimal, should

NOTES OF THE WEEK

GENERAL EISENHOWER, whose appointment to supreme command in the campaigns of European liberation based on Britain will be welcomed, has proved himself, by general admission, a first-rate collaborator. He has a grand knack of finding talents and mixing them. It was unfair to give him political responsibilities in North Africa and in his new position he will be free of these troubles. Britain will accept the appointment as being based on merit and achievement and not as a piece of international manoeuvre and balancing.

The Eisenhower stock is only German a long way back. His family moved into Switzerland in the seventeenth century and into America in the eighteenth: they were Pennsylvanians originally, and later emigrants into Kansas and Texas. "Ike" was a Tank man in the last war and went to the Philippines in 1935 as MacArthur's Chief of Staff. After Pearl Harbour he moved to the Staff at Washington. He has specialised in all kinds of mechanical warfare and the production needed for it.

The Goalkeeper

There is an obvious parallel between the task which Mr. Casey fulfilled in Cairo and the one he is about to take on in Bengal. In both cases he acts, as it were, as the goalkeeper for great Imperial armies. The Middle East was the main base for our Mediterranean campaigns; Bengal will be the main base for the reconquest of Burma and Malaya. Neither area is free from grave problems which, badly handled, might imperil our armies. In Cairo, Mr. Casey did a great job, of which the whole story is not yet told. It is largely to his credit that in the dark days when Rommel threatened Cairo this whole region kept quiet, steady, and loyal. In Bengal, Mr. Casey will find famine and pestilence, besides even graver political convulsions. If he can match his Cairo success in Calcutta—where he will be the first Commonwealth statesman to take high office in India—this will justify closer ties of Commonwealth and Empire.

Reprisals

Mr. Churchill tells in the "World Crisis" how in the closing days of the last war, with the end in sight and armistice negotiations already under way, a German U-boat sunk a food ship between Liverpool and the Isle of Man, with heavy loss of life. He puts on record how the violent reaction of public feeling to this gratuitous and stupid outrage completely killed the efforts of all those who, like himself, strove for a generous treatment of the beaten foe. "Swine they are and swine they remain" was the general verdict. If the Germans carry out their threat to commit judicial murder against our captured airmen they will make sure that the same feeling prevails once more.

The Benes Broadcast

Dr. Benes has left no doubt that his country will in future work in close harmony with Soviet Russia in economic, as in political, matters. Before leaving Moscow last week, for his journey back to London, he made a broadcast to Czecho-Slovakia in which he discussed the political significance of the new Pact with the Soviet, and his Government's economic aims. Czecho-Slovakia, he said, will "accept for its economic life a system of planning, with a scientifically prepared first Five-Year Plan." The country is to be less dependent economically on Germany

constancy in never flinching from tyranny's challenge, whatever national language it might speak.

In the conquered enemy countries we shall be in a position to suppress by force every attempt at the revival of Fascism or Nazism, while at the same time encouraging every honest endeavour to turn over a new leaf and to acquire the decencies and liberties and tolerance of the democratic way of life. In friendly countries the use of force on our part is out of the question. But it would be tragic if we positively helped to introduce into those countries the very germ which we have been fighting in Germany and Italy.

When we see Allied kings surrounded by the men who formerly established and carried on dictatorships in their countries; when we hear a friendly Head of State announce in a perfectly dictatorial manner fundamental decisions on the future of his nation over the heads of his still subjugated countrymen, even prescribing the number of parties he might admit to future elections; when we see movements and institutions fostered in London which are clearly modelled on the Storm Troopers and the Gestapo; when we watch on liberated territory that scapegoat-hunting and persecuting zeal which always herald the end of free speech and free opposition—then we must indeed regard all this as a most serious danger signal. To deal with these menaces in allied and friendly countries will require great skill and high determination.

HOME RAILS

THE Christmas public has obediently stayed (more or less) at home and the railways have had the dubious satisfaction of not turning thousands away. This war-time discipline, common now in all crafts and branches of commerce, of evading one's customers and frustrating trade, is a melancholy matter. Especially does it bear hardly on the railways which will need all the good will they can muster to meet competition after the war.

The railways are far too important for military and industrial purposes to be allowed to collapse when conditions change. They have done excellent war-service under galling conditions. Though we have cursed them for crowdings and delays, we have owed them more than we know. The twenty-first birthday of the present system of grouping was celebrated last week. Whether or no this form of grouping and control remain, reforms will be needed.

On the engineering side our railways have usually been excellent. On what may be called the domestic and amenity side they have not. Their huge boards of directors have never kept pace with the changes in the public's ways of living and feeding. Long after the Victorian Sunday had passed into our week-end, they continued apparently to believe that Sunday travel is a form of sin, deserving to be punished by a special service of slow and scanty trains. (The 'bus companies knew better and even doubled their Sunday services.) The equipment of stations was utterly behind the times. Who would wait in a station waiting-room without a shudder? Many of the refreshment rooms still belong to the age of gas-jets and lace-curtains. The enormous changes in public services, and amenity made by the modern cinema, motor-coach, cafés, cafeteria and so on, were overlooked.

The railways have been far too slow in employing women to run their domestic side. After the war there will be thousands of capable women with wide experience of administration, catering, and so on, looking for jobs. The railways should take the best of them, send them round America for experience, and then let them loose on our Mugby Junctions.

THE RESTORATION OF AUSTRIA

By A STUDENT OF EUROPE

THE decision of the Moscow Conference to restore a free and independent Austria has received relatively little public comment. But it was not only the most incisive political decision taken on any of the recent great conferences; it may also, in its implications, prove of the greatest importance for the future arrangement of all Europe. For Austria is not just some small country. It is one of the key regions of the Continent—economically, strategically, politically, culturally. And it has grown, not lessened, in importance through the developments of the last six years.

YEARS OF ECLIPSE

These last six years have been years of eclipse and humiliation for Austria. But they have brought one event which completely transforms the prospect for a re-established Austria: the great south-east migration of German industry. The war has shifted the industrial centre of greater Germany towards Austria, Bohemia, and Silesia, just as it has shifted Russia's industrial centre to the Urals. From 1938 onwards, the Nazis started an industrial high-pressure development in Austria, rightly regarding it as a much more conveniently situated centre of war production than the exposed Ruhr.

Later, when our air offensive enforced an actual evacuation of industries from the Ruhr-valley and western Germany in general, Austria became the main reception area. In a few years the country has been transformed into a gigantic workshop; and the value and importance of its new productive capacity is enhanced by the immeasurable industrial devastation in Germany herself and many other industrial areas of Europe. If Austria can get herself out of the German grip before she is heavily bombed—a big supposition, of course—she has quite a different prospect before her from that of the poor, agricultural, continually semi-bankrupt rump-Austria of 1919. Austria may to a considerable extent become the heir of Germany's inherent industrial power; she may experience the fairy-tale luck of Hansel and Gretel, who emerge from their captivity in the witch's house laden with the dead witch's riches.

The importance of this—not only for Austria but for Europe—can hardly be overrated. It may prove the key factor in the biggest problem of the first post-war decade: the economic recovery of Europe. UNRRA, in its first session in Atlantic City, very significantly failed even to broach this problem. There was probably a silent consensus that it cannot be solved even by the biggest international effort from outside. Relief alone—the short-term provision of the most desperately needed consumers' goods for the stricken countries—will tax the productive power of the outside world heavily. American and British industries will still for a long time have to produce for the war against Japan; Britain also faces big reconstruction tasks at home. Russian production will for many years after the war be entirely absorbed by the demands of internal reconstruction.

Much of the industrial power of Germany, France, and Italy is in ruins, and the devastation will increase before the firing ends. All these, or their equivalent, will have to be restored if Europe is to find her feet again. But there must be something intact somewhere from which to replant, retool, restart them; and it looks as if this something and somewhere may be found in Austria. If so, there will be no need to worry about unemployment and insolvency in the new Austria, and Vienna will become the natural centre of European reconstruction agencies—and thereby a natural capital city of Europe again.

However, Austrian industry will be largely without an owner after the war. Much of it belongs to-day to the Hermann Göring concern or to other German State or Party financed trusts, which will disappear with the crash of the Nazi system. At the same time, Austrian industry will require a certain amount of recapitalisation for the transition from war to peace production. This will probably have to come from Britain and the U.S.A. Britain and the U.S.A. will thereby acquire a corresponding amount of control; and the question of ownership may perhaps find its solution in some European trusteeship under the general supervision of UNRRA.

THE NEW WORKSHOP

If some such solution is arrived at, something like an economic general staff for Europe will automatically have come into being. And the industries of Austria, while immensely benefiting the country and every single one of its inhabitants, will nevertheless be a European, and not an Austrian, asset. If the same system can be extended to the plants which will be set up from there in other countries, this would obviously mean a big step towards European integration and unity. But that may be looking too far ahead.

In the meantime, it is clear that the economic existence of the new Austria will be, so to speak, a European existence. Austria will earn its living by being the original workshop of European rehabilitation, and later by remaining one of the European workshops. It will live as a province of Europe; as an isolated unit it would, just as in the years after 1919, only be able to vegetate. It is natural to ask whether there is not a political parallel to this economic relation between Austria and Europe.

The political existence Austria, which the Moscow C decided to restore, presents solved problem. THE RESTORATION OF AUSTRIA

By A STUDENT OF EUROPE

THE decision of the Moscow Conference to restore a free and independent Austria has received relatively little public comment. But it was not only the most incisive political decision taken on any of the recent great conferences; it may also, in its implications, prove of the greatest importance for the future arrangement of all Europe. For Austria is not just some small country. It is one of the key regions of the Continent—economically, strategically, politically, culturally. And it has grown, not lessened, in importance through the developments of the last six years.

YEARS OF ECLIPSE

These last six years have been years of eclipse and humiliation for Austria. But they have brought one event which completely transforms the prospect for a re-established Austria: the great south-east migration of German industry. The war has shifted the industrial centre of greater Germany towards Austria, Bohemia, and Silesia, just as it has shifted Russia's industrial centre to the Urals. From 1938 onwards, the Nazis started an industrial high-pressure development in Austria, rightly regarding it as a much more conveniently situated centre of war production than the exposed Ruhr.

Later, when our air offensive enforced an actual evacuation of industries from the Ruhr-valley and western Germany in general, Austria became the main reception area. In a few years the country has been transformed into a gigantic workshop; and the value and importance of its new productive capacity is enhanced by the immeasurable industrial devastation in Germany herself and many other industrial areas of Europe. If Austria can get herself out of the German grip before she is heavily bombed—a big supposition, of course—she has quite a different prospect before her from that of the poor, agricultural, continually semi-bankrupt rump-Austria of 1919. Austria may to a considerable extent become the heir of Germany's inherent industrial power; she may experience the fairy-tale luck of Hansel and Gretel, who emerge from their captivity in the witch's house laden with the dead witch's riches.

The importance of this—not only for Austria but for Europe—can hardly be overrated. It may prove the key factor in the biggest problem of the first post-war decade: the economic recovery of Europe. UNRRA, in its first session in Atlantic City, very significantly failed even to broach this problem. There was probably a silent consensus that it cannot be solved even by the biggest international effort from outside. Relief alone—the short-term provision of the most desperately needed consumers' goods for the stricken countries—will tax the productive power of the outside world heavily. American and British industries will still for a long time have to produce for the war against Japan; Britain also faces big reconstruction tasks at home. Russian production will for many years after the war be entirely absorbed by the demands of internal reconstruction.

Much of the industrial power of Germany, France, and Italy is in ruins, and the devastation will increase before the firing ends. All these, or their equivalent, will have to be restored if Europe is to find her feet again. But there must be something intact somewhere from which to replant, retool, restart them; and it looks as if this something and somewhere may be found in Austria. If so, there will be no need to worry about unemployment and insolvency in the new Austria, and Vienna will become the natural centre of European reconstruction agencies—and thereby a natural capital city of Europe again.

However, Austrian industry will be largely without an owner after the war. Much of it belongs to-day to the Hermann Göring concern or to other German State or Party financed trusts, which will disappear with the crash of the Nazi system. At the same time, Austrian industry will require a certain amount of recapitalisation for the transition from war to peace production. This will probably have to come from Britain and the U.S.A. Britain and the U.S.A. will thereby acquire a corresponding amount of control; and the question of ownership may perhaps find its solution in some European trusteeship under the general supervision of UNRRA.

THE NEW WORKSHOP

If some such solution is arrived at, something like an economic general staff for Europe will automatically have come into being. And the industries of Austria, while immensely benefiting the country and every single one of its inhabitants, will nevertheless be a European, and not an Austrian, asset. If the same system can be extended to the plants which will be set up from there in other countries, this would obviously mean a big step towards European integration and unity. But that may be looking too far ahead.

In the meantime, it is clear that the economic existence of the new Austria will be, so to speak, a European existence. Austria will earn its living by being the original workshop of European rehabilitation, and later by remaining one of the European workshops. It will live as a province of Europe; as an isolated unit it would, just as in the years after 1919, only be able to vegetate. It is natural to ask whether there is not a political parallel to this economic relation between Austria and Europe.

The political existence of that little Austria, which the Moscow Conference has decided to restore, presents a hitherto unsolved problem. Austria is not a small nation; it is the rump of a great Power. Vienna is not the capital of Tyrol, Styria, and Carinthia; it is one of the capitals of Europe. Its more popular reputation as a city of music and gaiety apart, it has been, for many hundred years, one of the greatest sources of political talent and ambition, and one of the greatest schools of administration in Europe; and that little top-heavy country of which it is the capital has even in its complete helplessness after 1919 never ceased to have some of the political magnetism of a potential great Power.

UNITED EUROPE

It is still irrationally feared by its succession States, who feel that even in the most carefully balanced and equalitarian Danubian federation Vienna would somehow eclipse Prague and Belgrade. It is hotly coveted—and also vaguely feared—by Italy and Germany, of whom it was, between the wars, the alternate satellite; memories of Austrian rule are not quite extinct either in Southern Germany or in Northern Italy. And projects are still everywhere rife to-day for making Austria again the centre of some bigger regional combination—Catholic South German or Danubian.

By insisting on Austrian independence, the Big Three have rejected all these projects. But the problem of Austria will somehow have to be solved, and if the regional solutions are discarded what remains but the bolder and more comprehensive European solution? Economically, Austria can only exist as a province of Europe; politically, too, her problems would dissolve if she were to become one of the United States of Europe. The political surplus forces and traditions of Vienna, for which little Austria provides too narrow a form, could easily and profitably be absorbed in the federal service of Europe.

The military defence of Austria's independence, which cannot be provided from her own resources and is difficult to guarantee by the far-off Powers of Britain, France, and Russia, would cease to be a problem in a federal defensive framework. An independent Austria will remain a centre of inevitable tension in Europe—pretender and potential prey, feared in the East and South-East, fearing the North and South—as long as she is not united with the East, North, and South under one overriding and uniting European authority, in which all have their part, and in which their rivalries are neutralised. In deciding on Austrian independence, the Big Three seem to have, consciously or unconsciously, drawn a bill on the account of a United Europe.

its trade with the rest of the world; in particular, it will recognise "the fact that we are geographically in the immediate vicinity of the Soviet Union, which will have fundamental interests in our economic life." The invitation to Poland to join in this new system of collaboration in Eastern Europe was renewed.

Changing Russia

The abolition of the Internationale as the national anthem of the Soviet Union (the B.B.C., however, played it after the King's Broadcast yesterday afternoon) and its replacement by a national and patriotic song comes at the end of a year which has seen more fundamental changes in Russia than any since the great revolution. The restoration of an officer corps; the abolition of the political commissars in the army; the adoption by Stalin of the title of Marshal; the dissolution of the Comintern; the restoration of the Russian Church—all this together, now symbolised in the change of the national anthem, amounts to little less than a new revolution from above, peaceful and orderly, but profound.

Songs of the Comrades

The Internationale was probably not as well known in this country as the Red Flag, on whose announcement that "The People's Flag is deepest red" our young Socialists were musically, and somewhat lugubriously, reared. Neither ditty had a very inspiriting air, and Bernard Shaw dismissed the latter as "the funeral march of a fried eel." The Red Flag's sombre "Tannenbaum" tune, with its note of defeatism, was perhaps better suited when some Left-wing boys rewrote the words, beginning "The Labour Flag is palest pink."

Platform Ditties

The British usually like their songs to be of the willow-waly kind, sonorous but sad. The Marseillaise was the perfect dithyramb of insurgents, but it fell into most unsuitable company when used by certain recent specimens of French politician. The songs that youth heard at Comrades' knees (or even from Red-hot mommas) have gone out, and British politics are dismally unmusical at present. There has been little of the combative party lyric since the 1909 Budget days. Then there was the Land Song (set to the tune of "Marching Through Georgia"—or was it Lloyd-Georgia?) and "Stamp, stamp, stamp upon Protection," which sounded like a treatise on tariffs by the great Josiah but was in fact the Free Traders' battle hymn, inviting to dismissive foot-work in fiscal matters. But these musical pleasures of the hustings are rare now. Why not a revival? There should certainly be a Beveridge ballad and something also on the theme of "Oh, to be in England, now that Uthwatt's there."

The Authoress of Ambleside

Three generations of children have known the Peter Rabbit books and the nursery rhymes of Beatrix Potter, who died last week. For the two-to-seven age-group her gentle, subtly simple stories have always been best-sellers; in the nursery Peter Rabbit is another Peter Pan. Many of the details were inspired by Miss Potter's memories of her Lake District childhood; to preserving this region she gave her money and her energies. Mr. McGregor, of the Peter Rabbit tales, was her uncle's gardener. One of her secrets was to have only a very few lines on each page; children learned to read easily in these wide open spaces, with their entrancing rivulets of story. The author (who was her own illustrator) saw her work translated into many languages; before the war, and possibly even now, the Peter Rabbit books were read as eagerly by French children as by English.

Wider Italian Control May Ease Situation

By OUR ITALIAN CORRESPONDENT

AFTER the capture of Montelungo, by Fifth Army troops, including Italian units, General Clark issued an Order of the Day: "The firm will of the Italian soldiers to free their country from the Nazi yoke, shown by the victory which has crowned the attack on harsh and rugged terrain, may serve as an example to all European people oppressed by the common German enemy."

Whatever the varying shades of political opinion in the Italian fighting forces, it is certain that their spirit will be still further buoyed by the knowledge that they are fighting for a self-governing, free, and independent Italy.

The Advisory Council for Italy seems to appreciate this, and has recommended the transfer to an Italian administration of all occupied territory at a certain distance from the actual battle zone. This recommendation coincides with the spirit of the declaration issued after the Moscow Conference about Italy and, if accepted, will go far towards solving the pressing problems facing the Allies in the first freed territory of Europe.

Popular Pressure

The objection that the fulfilment of the recommendation means the transfer of further territory to the unrepresentative Badoglio Government, does not hold good. Only with territory greater than it has at its disposal at present, can any Italian Government become representative; because only when faced by larger masses will the King and his certainly undemocratic circles give way to the pressure of the people who demand vigorous prosecution of the democratic war and the building up of a sound political and economic democracy.

A thorough democratisation of Italian organisations, from local authorities and trade unions to a central Government, would go some way to solve the terrible economic problems now afflicting Southern Italy.

Black Market

The difficulties arising from the shortage of transport, clothing, fuel, and, above all, food can only be alleviated by a just distribution of available goods and services. Yet the black market cannot be tackled without giving the actual producer, the farmer and the labourer, responsibilities, accompanied by the knowledge that they can exercise their legitimate rights. The urgently needed democratisation of local councils and trade unions would necessarily follow the transfer of administration advocated by the Advisory Council.

Badoglio needs efficient and popular men in his Government and this need will become greater as the territory under his control is increased. But he knows that he can obtain such collaboration only at the price of King Victor's abdication. Pressed by more urgent needs, he—or whoever may take his place—would finally have to pay that price.

The Allies would thus be spared the task of tackling a problem which they themselves cannot possibly solve satisfactorily, but for the solution of which they are and will be held responsible as long as the administration of the greater part of liberated Italian territory remains in their hands.

Nazis Trying To Build a New Bomber Force

But Her Training Personnel Was Wasted in Russia and Africa

By FREDERICK TOMLINSON, Observer Air Correspondent

THE Germans are striving to re-create the Luftwaffe's bomber force, but it is improbable that they will be able again to make it the offensive weapon we knew in 1941. The handicaps under which they are labouring are too great.

In the crises at Stalingrad and in Tunisia instructors were taken from the bomber schools and sent to pilot the Ju 52 transport planes which tried to supply the hard-pressed German ground forces. They were shot down in their hundreds. From Sfax to Foggia almost every airfield bears the wreckage of triple-engined German transport aeroplanes which gave such valuable service when there was no air power to challenge the Luftwaffe.

Many more were destroyed in Russia and the Germans lost not only aircraft (which they could easily replace) but invaluable pilots who had led the 1940-41 night offensive against Britain. Their loss broke the back of the German bomber operational training plan.

For the creation of what they hope will be a new bomber force the Germans are re-equipping squadrons with the Me. 410, the Ju. 188, and the heavy Heinkel 177, which (for the moment) is largely being used as a shipping reconnaissance aircraft. It is impossible even to guess whether these new aeroplanes are to be used against this country, against Russia, or held as a strategic air reserve against the invasion of western Europe.

2,000, But Too Few

It has been fortunate for Germany that the Luftwaffe fighter pilot training scheme did not suffer the same fate as the bomber organisation, and this is the reason why the enemy has been able to assemble 2,000 day and night fighters in the west. But even this formidable force is proving inadequate now that the American area bombing of north-western German targets is assuming, in German eyes, something of the seriousness of Bomber Command's night attacks.

Two years ago the German defences against air attack were characterised by a great belt of searchlights stretching many miles to the south from Denmark. The night bombers had to pass through the lights whatever their target, and the Germans believed that the bombers would fall easy prey to their night fighters and anti-aircraft batteries.

Scientific developments in aids-to-night-fighting, however, made the searchlight belt redundant, and it was replaced by a belt of radiolocation stations called the Kammhuber line, after General der Flieger Kammhuber, who was in charge of the German night defences. Each station had an effective range of about 20 miles, and its purpose was to direct night fighters to the bombers.

This method of vectoring night fighters to individual raiders was used throughout the Battle of the Ruhr, but it proved ineffective when Bomber Command began its systematic attacks on Hamburg. In the first Hamburg attack we lost only 12 bombers and in the second only 17.

The Germans then decided to supplement the ground control of individual fighters by instituting night-fighter packs, which were directed towards the bomber formation and then left to their own devices. So far as one can discover the Germans have largely abandoned any hope of guiding individual aircraft to our

France Swept by Sabotage

—Petain

MARSHAL PETAIN, making his first broadcast, on Christmas Eve, since the mysterious cancellation of his speech on November 13, spoke with apparent vigour until towards the end of his three-minute speech. Then he betrayed signs of fatigue and excitement.

"Christmas Day is the day of love," he said. "Nevertheless, sabotage is sweeping through France, causing real terror. Frenchmen are quarrelling, hating each other and refusing to accept the laws of the authorities. In spite of all its disasters, I maintain my faith in France's future.

"But I beseech you French to stop fruitless discussion, futile rivalries. I ask you to think of the mortal peril which would strike down France if she were to be overridden by civil war.

"Our sufferings are immense, but the storm will subdue and the day will come when Frenchmen will love each other again."

Nazi Works Wrecked

French Patriots, in a forty-eight-hour drive in Savoy, knocked out chemical works, crippled engineering works, and disrupted enemy transport, according to reports received yesterday by French quarters in London.

Eluding sentries guarding the German water-power station near Modane (French end of the Mont Cenis tunnel) the Patriots mined the water gates of the dam producing electric current for the most important chemical works at Plombieres Saint Marcel. Half-an-hour later there was a terrific explosion and two of the three gates were shattered. The chemical works were out of action for at least a fortnight.

A few hours before this ten Patriots, masked, armed, and each carrying a bomb, gained entrance to the German engineering works near Grenoble and blew up the power transformer. On the following day oil stocks outside the main marshalling yards near Grenoble, on the Paris-Italian line, were set on fire.

Portugal Frees Prisoners

Hundreds of political prisoners in Portugal will be released under a Christmas amnesty, and it was semi-officially stated that there are now virtually no political prisoners in the country, apart from a few dozen held for what are described as "social offences," such as illegal strikes.

WAR-TIME BRITAIN No. 2—"Belfast Dancehall"

By Feliks Topolski.

Allied Offensive 'from all Points of Compass'

Mr. Roosevelt's Hopes of Peace for Generations

PRESIDENT ROOSEVELT, in his Christmas Eve broadcast announcing the appointment of General Eisenhower as Allied Supreme Commander of the "Second Front" in Europe, disclosed that of the ten million men now in the United States armed forces 3,800,000 are now on duty overseas, more than twice the number overseas a year ago. He said that by July, 1944, that number will rise to over five million.

The President also reviewed the decisions of the Cairo and Teheran Conferences, and plans made with the leaders of Britain, Russia, and China for "stepping up our successful attack on our enemies as speedily as possible and from many different points of the compass."

He gave a warning against complacency, saying that "the end is not yet in sight," but he expressed his sense of "certainty" that the Allies would win a "just peace that would last for generations."

"We may look forward with real substantial confidence that, however great the cost, 'peace on earth, good-will toward men' can be and will be realised and ensured. This year I can say that. Last year I could not do more than express a hope. To-day I express a certainty, though the cost may be high and the time may be long.

"Within the past year, within the past few weeks, history has been made, and it is far better history ... sise that word respectable—for we intend to rid them once and for all of Nazism and Prussian militarism and the fantastic and disastrous notion that they constitute the master race.

"To use an American and ungrammatical colloquialism, I may say that I 'got along fine' with Marshal Stalin.

"He is a man who combines a tremendous, relentless determination with a stalwart good humour. I believe he is truly representative of the heart and soul of Russia, and I believe that we are going to get along well with him and the Russian people very well.

"Britain, Russia, China, and the United States and their Allies represent more than three-quarters of the total population of the earth. As long as these four nations stick together in determination to keep the peace there will be no possibility of an aggressor nation arising to start another world war.

"But these four Powers must be united and co-operative with all the freedom-loving peoples of Europe and Asia, and Africa, and the Americas. The rights of every nation, large or small, must be respected and guarded as jealously as are the rights of every individual within our own republic.

Fight for Freedom

"It has been our steady policy, and it is certainly a common-sense policy, that the right of each nation to freedom must be measured by the willingness of that nation to fight for freedom.

"And to-day we salute our unseen Allies in occupied countries—the

Indian Leader Again Tells Britain to Quit

KARACHI, Dec. 25

TELLING Britain to "divide and quit," Mr. Mohamed Ali Jinnah, presiding at the thirty-first session of the All-India Muslim League here last night, made a strong demand that Britain should leave India and grant the Muslims independence.

"We shall never rest content until we seize the territories that belong to us and rule over them," he said.

Mr. Churchill said he did not preside over the British Government to liquidate the Empire. But voluntary liquidation is more honourable than a compulsory one, and the British Empire will be liquidated one day.

"We are now impressing on British statesmen that the only honest way for Great Britain is to 'divide and quit.'"

Referring to the Viceroy's speech at Calcutta recently, Mr. Jinnah said: "It is really astonishing that the representative of the Crown can think that he can win this war while he is totally indifferent to the political situation.

"The British Government have to get the whole-hearted support of some party in this country, if not all, but every party is kept at arm's length and dissatisfied."

"No Authority"

Replying to the Viceroy's appeal for co-operation, Mr. Jinnah said: "It is really a flagrant abuse of the English word 'co-operation.'

"Without giving us any real share of authority in the Govern-

Allied Offensive 'from all Points of Compass'

Mr. Roosevelt's Hopes of Peace for Generations

PRESIDENT ROOSEVELT, in his Christmas Eve broadcast announcing the appointment of General Eisenhower as Allied Supreme Commander of the "Second Front" in Europe, disclosed that of the ten million men now in the United States armed forces 3,800,000 are now on duty overseas, more than twice the number overseas a year ago. He said that by July, 1944 that number will rise to over five million.

The President also reviewed the ... of the Cairo and Teheran Conferences and ... made with the leaders of Britain, Russia, and China ... our successful attack ... our enemies as ... as possible and from many different points of the compass."

... a warning against complacency ... the end is not ... He expressed his ... that the Allies would win a ... peace that would last for generations.

"We may look forward with real ... confidence that, however ... peace on earth, goodwill towards men ... can be and will be ... This year I could ... no more than ... a hope. To-day I express a certainty, though the cost may be high and the time may be long.

"Within the past year, within the past few weeks, history has been made and it is far better history ... sise that word respectable—for we intend to rid them once and for all of Nazism and Prussian militarism and the fantastic and disastrous notion that they constitute the master race.

"To use an American and ungrammatical colloquialism, I may say that I 'got along fine' with Marshal Stalin.

"He is a man who combines a tremendous, relentless determination with a stalwart good humour. I believe he is truly representative of the heart and soul of Russia, and I believe that we are going to get along well with him and the Russian people very well.

"Britain, Russia, China, and the United States and their Allies represent more than three-quarters of the total population of the earth. As long as these four nations stick together in determination to keep the peace there will be no possibility of an aggressor nation arising to start another world war.

"But these four Powers must be united and co-operative with all the freedom-loving peoples of Europe and Asia, and Africa, and the Americas. The rights of every nation, large or small, must be respected and guarded as jealously as are the rights of every individual within our own republic.

Germany's Influence in Bolivian Revolution

Warning from South America

OBSERVER SPECIAL CORRESPONDENT

NEW YORK, December 24

THE decision of Mr. Hull, Secretary of State, to await developments before deciding whether to recognise the new Bolivian regime appears fully justified in the face of conflicting reports reaching Washington and New York, and contradictory opinions expressed by South Americans here.

The revolution is essentially nationalistic and anti-capitalistic. To understand it one must realise that since 1889, when the old colonial silver oligarchy was replaced by the new tin oligarchy, the entirely distorted economic life of Bolivia was dominated by three tin masters: Patino, Aramayo, and Hoschild.

Patino started exploitation of the tin mines as a poor half-caste and is to-day one of the five richest men in the world.

His mining enterprises are closely connected with American capital, his smelting interests are strongly connected with British capital through his control of Williams Harvey, the Liverpool smelters.

All revolutions and all Governments in the past forty years have been financed by one or other of the tin masters. The present revolution is the first against the tin interests.

To-day, in Washington, I had a personal interview with Enrique Lozada, "confidential agent" of the new Bolivian Government and its ambassador if it is recognised. Lozada was adviser to Rockefeller, and is a well-known Liberal.

He says that the group taking power, the "Movimiento Nacionalista Revolucionario," has been in existence for eight years, has many adherents among younger officers, and has Leftish tendencies.

Contact with Nazis

Victor Paz Estenssero, leader of the new regime, is nationalistic and socialistic. He was for many years regarded as being in contact with the Germans, who are naturally exploiting the situation.

It is also of importance to remember that the Bolivian Army, like other South American armies, is mainly German-trained.

The antecedents of Senor Estenssero and the "Nationalist Revolutionary Movement" are not reassuring. In the past they were distinctly pro-Axis and anti-American, opposed Bolivia's declaration of war on the Axis. Their official organ was on the American black-list.

They accused General Penaranda of laxness in pressing Bolivia's national plans. Their declarations since arriving to power contradict their past. They promise people civil rights, new elections, social security, and pledge fidelity to the United Nations.

Other South American observers have issued warnings that these declarations are merely camouflage, that Estenssero visited Buenos Aires ten weeks ago, where the plot was planned, and that the Bolivian revolution is the result of Axis and Falangist Argentine action to organise the Spanish-speaking republics on a Fascist-militaristic basis under Argentine leadership against Brazil, the United States, and the United Nations.

The pretext for this would be that it is necessary to form a front against Bolshevism which they say may come in Europe as a result of the Anglo-American alliance with Russia.

This is the old story of establishing totalitarianism through fear of Bolshevism.

The same observers also issue a warning against possible similar events in Chile, Peru, and Paraguay.

Whole Nazi Idolatry Must Go —*The Primate*

THE need of rooting out Nazi idolatry was stressed by the Archbishop of Canterbury (Dr. W. Temple) in a Christmas Day broadcast.

Hitler's tyranny could be overthrown by force of arms, and we meant to do it.

But beyond that was the greater need to root out from men's minds the Nazi idolatry, and that could not be done by force of arms.

"The thing we are fighting is a revival in a peculiarly hideous and most mighty form of the thing Christ came to supersede.

"Germany, with the exception of its better and wiser folk, believed that Hitler could lead and deliver first Germany and then mankind. To us this seems so ridiculous that many Englishmen cannot take it seriously.

"They see that there is a tyranny to be destroyed, but they cannot see that there is an idolatry to be torn out of men's minds; and it is vital that we all should see this.

"This idolatry is very old. Mussolini used to talk of reviving the Roman Empire. Hitler aimed at achieving in real fact what the Holy Roman Empire aspired to be."

The causes that produced the Nazi idolatry were in the souls and circumstances of men. It was not enough to destroy the tyranny of darkness. We must become carriers of that light which was ready to guide our feet into the way of peace.

'Tribunals Set Up to Try Airmen'

GENEVA, Dec. 25

Special tribunals are being set up in Germany for trying British and American airmen as a reprisal for the Soviet hanging of German war criminals, claims the Vienna correspondent of La Suisse, to-day.

Although news of the formation of the tribunals has not appeared in the German Press, it has spread throughout Germany.

"People are wondering why these reprisals are being taken against British and Americans but not against Russians," said the Vienna correspondent, who added:—

"Opinion here is that the German rulers do not wish to provoke the Russians, as they still hope for a change of Russian foreign policy."—Reuter.

raiders.

Impossible Task

Bomber Command will continue to win the tactical battle against the German defences, because the very size of Germany and occupied Europe enables Sir Arthur Harris to switch his forces from one target to another as he pleases.

From Denmark to Paris and from France to Eastern Germany the German fighter squadrons have to be at readiness for twenty-four hours a day, and under the new method of Allied bombing the precise target is rarely clear to the enemy until a few minutes before the pathfinders drop their "markers."

The target for the night may appear to be Berlin. But the bombers may suddenly turn aside and attack any one of half a dozen towns within a radius of 100 miles of the capital. The fighter packs will be told to go to one assembly point after another until the target is discovered. They may then be many miles from the bombing, and in the past few weeks the main strength of fighters has frequently arrived over the target area when most of the bombs have been dropped.

A city has to rely on its ground defences if a diversion is mistaken for the real attack, and the difficulty of giving the correct orders to the fighter packs must be driving many German ground controllers to despair.

More Ground Defences

Incidentally, it has been reported that there has recently been a considerable strengthening of German ground defences. Many 88mm. guns, which would be useful in Russia or Italy as anti-tank weapons, are now defending the Reich against air attack; only a quarter of Germany's anti-aircraft personnel is now on the Russian and Italian fronts.

It is estimated that Berlin is now defended by 400 heavy anti-aircraft guns; 400 light guns, and 250 searchlights, yet the preliminary reports of Bomber Command's photographic interpretation unit indicate that a considerable part of Berlin has been damaged by fire and high-explosive.

The full reports of the damage will soon be available, and they may reveal that what appeared at first to be wild rumours from neutral countries were in fact true.

for the whole human race than any that we have known, or even dared to hope for, in these tragic times through which we pass.

Tribute to Churchill

"Of course, as all of you know, Mr. Churchill and I have happily met many times before, and we know and understand each other very well. Indeed, Mr. Churchill has become known and beloved by many millions of Americans, and the heartfelt prayers of all of us have been with this great citizen of the world in his recent serious illness.

"The Cairo and Teheran Conferences, however, gave me my first opportunity to meet the Generalissimo Chiang Kai-shek and Marshal Stalin, and to sit down at the table with these unconquerable men and talk with them face to face. We had planned to talk to each other across the table at Cairo and Teheran, but we soon found that we were all on the same side of the table.

"We were able not only to settle upon definite military strategy, but also to discuss certain long range principles which we believe can assure peace in the Far East for many generations to come.

"Those principles are as simple as they are fundamental. They involve the restoration of stolen property to its rightful owners and the recognition of the rights of millions of people in the Far East to build up their own forms of self-government without molestation.

"Gigantic Attack"

"Within three days of intense and consistently amicable discussions, we agreed on every point concerned with the launching of a gigantic attack upon Germany.

"The Russian Army will continue its stern offensives on Germany's Eastern front. The Allied Armies in Italy and Africa will bring relentless pressure on Germany from the south, and now the encirclement will be complete as great American and British forces attack from other points of the compass.

"The United Nations have no intention to enslave the German people. We wish them to have a normal chance to develop, in peace, as useful and respectable members of the European family.

"But we most certainly empha-

underground resistance groups and the armies of liberation. They will provide potent forces against our enemies when the day of invasion comes.

The overwhelming majority of all the people in the world want peace. Most of them are fighting for the attainment of peace, not just a truce, not just an armistice, but peace that is as strongly enforced and as durable as mortal man can make it.

'If we are willing to fight for peace now, is it not good logic that we should use force if necessary, in the future, to keep the peace?'

"The war is now reaching the stage where we shall have to look forward to large casualty lists—dead, wounded, and missing. War entails just that. There is no easy road to victory, and the end is not yet in sight.

"Massive offensives which are in the making—both in Europe and the Far East—will require every ounce of energy and fortitude that we and our Allies can summon on the fighting fronts and in all the workshops at home."

Gestapo Arrest 3,000 in Hungary

ISTANBUL, Dec. 25

Reports from Hungary state that 3,000 Left Wing sympathisers have been arrested in Budapest and other Hungarian towns during the last four days.

The arrests appear to be the direct consequence of last week's political reconciliation between the pro-Nazi Count Imredy and Prime Minister Kallay, after the latter had been threatened with a German coup d'état unless he acted against the underground "Peace Party."

Sixty-three land workers' cultural clubs were closed, wireless sets confiscated, and house-to-house searches are being made throughout the country by 15,000 members of the new auxiliary police against internal enemies.—Reuter.

Submarine Overdue

The United States submarine Grayling is overdue and must be presumed lost, it is officially announced in Washington, states Reuter.

ment, we are asked to do the work of camp followers and menials.

"The British Government is pursuing a definite policy. It does not want co-operation from any party.

"Congress, which decided not to co-operate and resorted to mass civil disobedience, has been outlawed.

"We Muslims offered our hand in co-operation for the job of winning the war provided that we were given a share and authority in the Government and that a definite promise was given that we should reap our share in the fruit of victory.

"That has been rejected, and our organisation is being treated like Congress, which undoubtedly represents a solid body of Hindus.

"They would like to outlaw the Muslim League. We are quite ready for it."

Although attacking the Viceroy's appeal for co-operation, Mr. Jinnah said Lord Wavell had spoken like a soldier and, by using plain words which the layman could understand, had made a definite contribution to the political problem of India.—Reuter.

India Needs Strong Hand at Centre

Because of shortage of space deletions had to be made in the interview, published in these columns last Sunday, with Sir Srinivasa Sarma, managing editor of the Calcutta weekly, "The Whip." Sir Srinivasa, it should be made clear, believes that if the detained Congress leaders withdrew their "Quit India" resolution and made amends their action would meet with a favourable response from the authorities.

But the first move should come from the Congress leaders, who, he believes, should denounce their earlier actions and "have the political courage to own their error and make amends."

Mrs. Gandhi Decision

It was officially stated in New Delhi that Mrs. Gandhi will not be released from detention in the Aga Khan's palace because it would mean her separation from her husband during her illness. She is receiving every possible medical care.

The King's Christmas Broadcast to the Empire

Below is the text of the King's Christmas broadcast to the Empire yesterday

ONCE again, from our home in England, the Queen and I send our Christmas greetings and good wishes to each one of you, all the world over.

SOME of you may hear me on board your ships, in your aircraft, or as you wait for battle in the jungles of the Pacific islands, or on the Italian peaks. Some of you may listen to me as you rest from your work, or as you lie sick or wounded in hospital. To many of you, my words will come as you sit in the quiet of your homes. But, wherever you may be, to-day of all days in the year, your thoughts will be in distant places and your hearts with those you love.

I HOPE that my words, spoken to them and to you, may be the bond that joins us all in one company for a few moments on this Christmas Day.

WITH this thought in my mind, I wish to all who are on service good luck and a stout heart; to those who wait for them to return, proud memories and high hopes to keep you strong; to all children, here and in the lands beyond the seas, a day of real happiness.

I SEND these words of Christmas greeting to all of you who dwell within the family of the British Commonwealth and Empire. I know you would wish me also to send a message of hope to our gallant Allies who fight with us, and to all who, in the loneliness of exile or the horror of invasion, look forward to our coming victory.

IN this year almost passed, many things have happened, under God's providence, to make us thankful for His mercies.

THE generous strength of the United States of America, the tremendous deeds of Russia, the endurance of China under her long ordeal, the fighting spirit of France re-born, and the flower of the manhood and womanhood of many lands that share the burdens of our forward march—all these have played their part in the brightening of our fortunes on sea, on land, and in the air.

SINCE I last spoke to you many things have changed. But the spirit of our people has not changed. As we were not downcast by defeat, we are not unduly exalted by victory. While we have bright visions of the future we have no easy dreams of the days that lie close at hand. We know that much hard working and hard fighting and perhaps harder working and harder fighting than ever before are necessary for victory. We shall not rest from our task until it is nobly ended.

MEANWHILE, within these islands, we have tried to be worthy of our fathers; we have tried to carry into the dawn the steadfastness and courage vouchsafed to us when we stood alone in the darkness.

THIS is not the time for a chronicle of our progress. But there is one landmark in the sombre, world-embracing battlefield which I hope and I trust may endure. Wherever their duty has called our men and women, they have gained new friends and come to know old friends better. They have learnt to share the burdens, and to read the hearts, of their neighbours; they have laid the foundations of new friendships between nations, and strengthened old ones formed long ago.

AS a result, there is springing up in every country fresh hope that out of comradeship in sacrifice shall come power to restore, and power to build anew.

I SAW proof of this when I visited North Africa in the summer. I saw many thousands of men of the United Nations, united in action, in heart, and mind and purpose. The only rivalry between them was in the service of a great cause, their only aim was the defeat of a common enemy.

IN the same spirit of unity men of divers races have come together in the council chamber and round the conference table; some to meet the stern, immediate demands of war itself; others to heal the wounds that war deals to all humanity—to feed the hungry, shelter the homeless, mend the broken, and succour the poor.

SO, as we see the clouds breaking on this Christmas Day, we should take comfort from our faith that out of desolation shall rise a new hope, and out of strife be born a new brotherhood.

FROM this ancient and beloved festival that we are keeping today, sacred as it is to home and all that home means to us, we can draw strength to face the future of a world riven by a tempest such as it has never yet endured. In the words of a Scottish writer of our day: "No experience can be too strange and no task too formidable, if a man can link it up with what he knows and loves."

The King's quotation in the last paragraph is from "Memory Hold the Door," the autobiography of Lord Tweedsmuir (John Buchan).

Post Mortem on Christmas of 'Half-a-Turkey'

By ALISON SETTLE

POULTERERS, distracted by the Christmas claims of customers, solved problems of poor supplies by cutting turkeys in half. Housewives approved: family parties were smaller.

Smithfield Market was cleared of birds by Wednesday.

Few birds were sent by rail. Among the mountains of luggage filling Platform No. 1 at Euston only a few rabbits and hares were seen. There were many hundreds of bicycles, and prams, with dolls' beds, toy tricycles, a couple of armchairs, children's horses and animals, and thousands of brown paper parcels.

Shops in the West End say that never has there been so good natured a crowd. There was money in plenty to spend but few assistants to serve. In one big Oxford-street store the chairman and his junior executives directed traffic on the ground floor, while secretaries became saleswomen.

In the book department 5,000 persons passed through each day. "But only a proportion could buy," added the store manager, "because of staff shortage."

Grapes at 20s. a pound sold out quickly. So did 12s. 6d. peaches. A pineapple at £5 15s. 6d. was sold as soon as it was put on show. There were queues for flowers at 5s. a bloom.

Trees Left Over

Christmas trees were not sold out: the impossibility of decorating them deterred purchasers who chose instead holly and mistletoe.

Christmas cards lasted out better than in previous war years. Although their manufacture is generally prohibited, the Minister of Supply made a special allocation of 625 tons of paper this year for greeting cards.

Far fewer children were brought to the shops this season: parents had to face demands for toys at tremendously high figures or risk disappointing the children.

Last allocations of children's oranges will be made in the coming week in Birmingham, South Wales, and some country districts which failed to get earlier allocation. As soon as these are cleared, it is hoped that the adult distribution of four pounds a head of population, staggered over the months between January and April, will begin.

To-day's Services

St. Paul's Cathedral.—10.30, T.D. and Bened.; 11.10, Rev. H. J. R. Osborne, M.A., Prebendary; 11.30, Int.; 3.15, Rev. F. A. Cockin, M.A., Canon-in-Residence.

Westminster Abbey.—8, H.C.; 10.30, Rev. Adam Fox, M.A., Canon-in-Residence; 11.30, H.C.

Tories Take a Leaf from the Fabian Book

Progressive Changes at Westminster

By OUR PARLIAMENTARY CORRESPONDENT

MORE significant than anything else at Westminster during the past year has been the way in which the Conservative Party has taken leaves from the Fabian book. Political research has become the hobby of the politician who formerly guided himself by "ordinary common sense," or, more simply, by the Party Whip. The effect has been nothing but good.

The process began two or three years ago, when Mr. R. A. Butler and Sir David Maxwell Fyfe, with others, set up an organisation in the Conservative Party to study problems of reconstruction. Younger people were mainly chosen to serve on the sub-committees formed to deal with particular problems: ten are at work, four have already produced reports, and have seen them impress current political thought—that on demobilisation in particular.

In the Liberal Party there has been similar work. A stimulating series of reports flows from its high and young thinkers. In the Labour Party authentic Fabian study and utterance continue in their orthodox way with a new liveliness.

More lively still, Mr. Herbert Morrison, though a member of the War Cabinet, has stumped the country with a New Economic Policy, aimed at Full Employment and against Monopoly. He offers a new brand of Socialist doctrine which mixes private enterprise and public control with a minimum of nationalisation; but the offer has not yet been taken up by the Labour Party.

M.P.s from the Forces

The end of 1942 and the beginning of 1943 saw several young men brought back from the Forces to give their whole time to the work of the House of Commons. They had official encouragement to come back: they were needed if Parliament was to do its work of preparing for the peace. But many, when they came, found their work ineffective and dull, and not yet greatly taken up with the practical business of preparing reconstruction. Parliament and its procedure are not yet cleared for action, and a sense of frustration has resulted. Meanwhile, too many M.P.s are still away from Westminster; if Parliament is at last permitted and organised to do the work that is required, they will all be needed.

The main issue is the desirability of reintroducing the committee system by which more Bills could be handled simultaneously and more Acts passed. The Standing Committees, which in normal times develop Parliamentary habits and give plenty of effective work, have not sat since the war. Now, after steady pressure, they may be revived in the New Year.

Among the unofficial committees formed early in the year to study this subject or that, one began to go into problems of social reform, with special reference to the Beveridge Report.

The Committee was then inspired by the Prime Minister's March broadcast. At length it made itself into a small army with the banner of the Tory Reform Group. Its achievements in less than a year of life have gratified its members and impressed the Party's leaders.

ena-Parliamentary body whose membership is not drawn from Conservatives alone. Its aim, too, is to foster research, to put ideas into circulation, to get facts for those willing to use them when policies are being framed; it has fostered a good deal of the recent Conservative activity over war pensions.

Conservative reputations, reading from left to right, have changed. Mr. Quintin Hogg is making a brilliant mark as the prime aplogist of the Tory Reformers, back from the wars and working hard and well; there are his earnest colleagues, Viscount Hinchingbroke, leader of the group, Mr. Hugh Molson, and, ablest of all the Young Tories, Captain Peter Thorneycroft. Members have been much impressed by Sir Edward Grigg's book, "The British Commonwealth," a product in fact, of one of the Conservative Party's reconstruction committees. Mr. Ralph Assheton has increased a sound Conservative reputation, and annoyed some Socialists, by his well-argued week-end speeches. Firther to the Right, Sir Herbert Williams and his friends have agitatet themselves about controls; and they have shared with the whole House a jealous regard for its own rights and privileges, which has expressed itself, among other ways, in a keen watch on delegated legislation.

Mr. Eden's Future

After ill-natured reports of Sir James Grigg's likely removal from the War Office, M.P.s are becoming almost as tolerant of his terseness as of Sir John Anderson's prolixity; both have gained more of the affection of the House. And Mr. Anthony Eden has led it with increasing success, though how long he may be able to continue to be Leader and to run the Foreign Office is a question that sometimes bothers his friends.

And so the wind of progress has been blowing at Westminster much harder than the Government yet seems to realise. The year brought little actual legislation on the problems of reconstruction, to which all this new thought could be applied. Work has been deliberative, not legislative.

The Government has been preoccupied by the war, but nevertheless much too sober, cautious, and timid, and, indeed, more-than-Fabian in its approach to reconstruction. It has been served with information and expert advice; and it has produced some measures with a post-war bearing: the Catering Wages Act; another to establish a Nurses' Charter; some temporising work on pensions and workmen's compensation; the beginnings of the reform of the income tax system, and, most important, the Tomlinson Bill for rehabilitating and re-employing the disabled; and the great Butler Education Bill.

Real Ideas

The Ministry of Town and Country Planning has been set up; and its solitary legislative achievement has been an Act to bring all the country, potentially, under planning. But the major work of this Department, like that of so many others, remains to be displayed in a whole library of White Papers promised for 1944. The Beveridge Report, subject of so much prodding at question and other times, has been rewritten by the Government. There was a report on post-war

VOICE OF THE ENEMY

Goebbels Has Had a Year of Bad Guesses

THE German propaganda service in 1943 has—from the Nazi view-point—had a year of bad luck. Goebbels has, of course, made many fanciful boasts which could never be fulfilled, but he has had to abandon some promising lines of propaganda which were, at first, based on genuine Allied difficulties.

Goebbels was frequently proved wrong, not so much because he was lying from the beginning but because the Allies, by their tenacity and skill, overcame their problems.

After Alamein and the landing in N.W. Africa, the Axis boasted of their satisfaction at having "swopped the Libyan desert for Tunisia, impregnable guardian of the Mediterranean passage, easy to supply and to defend."

A few months later Africa was clear of the enemy, but, said the Axis propagandists, the defence of Tunisia had gained them so much time that the Fortress of Europe had been made impregnable.

U-Boat Threats

Sicily was successfully invaded and conquered, and the Germans claimed it as an Axis victory because the Allies had not succeeded in imposing a "Dunkirk" on them.

During the year the assertion that the air offensive against Germany was fruitless and that it was even disastrous for the Allies (as it deprived them of the necessary air power in other theatres of war) was soon nullified by the appearance of powerful Allied air forces in many parts of the world and by the increasing weight of the raids.

In the early part of the year the U-boat menace was very real and serious, and it was played up as a lethal antidote to the threat from the air. "With her planes England has us by the wrist," said Goebbels last April, "but with the U-boat we have her by the throat."

Soon the picture was reversed and Allied air-power beat the U-boat. Then Goebbels spoke of a lull necessitated by the fitting out of the U-boats with secret new and deadly devices for the forthcoming onslaught, the Doenitz offensive.

"Secret Weapons"

When it became apparent that the U-boat had failed against the R.A.F., Goebbels began to speak of secret, new and deadly weapons which would put an end to the air war, and it remains to be seen whether these will be more successful than the secret U-boat armament.

The Fortress of Europe, "from Bordeaux to Stalingrad, from Narvik to Tunis," was for a long time a pet theme of Axis propaganda. Since its conception the fortress has been greatly reduced in size, the distance of the fighting fronts from Germany, once "more than 1,000 kilometres," has shrunk to "several hundred kilometres"; its war potential, once proclaimed as superior to that of the United Nations in man-power and material, no longer appears in Goebbels's show after the loss of the man-power of Italy and the rich territories of Russia.

Finally, what a change there has been in Axis propaganda since the Casablanca Conference, when Stalin's absence gave the cue to an energetic campaign directed against unity among the United Nations. Teheran has meant that the tale of Allied disunity has had to be buried, even by Goebbels himself.

Ferment Spreads

The Tory Reform Committee's best achievement, apart from performances in debate, has been the production of a manifesto—"Forward—by the Right"—to explain the progressive policies of the Tory Left. With great boldness and vigour in Parliamentary debate and action, these young Conservatives can be a powerful force.

These beginnings of intellectual ferment in the Conservative Party have spread to its Centre. The Progress Trust has been formed, an forestry; another will shortly deal with the effect of taxation on woodlands. Meanwhile, the Government has refused to be committed on everything. It has barely been brought so far over agriculture as to agree to discuss policies for the transitional and post-war periods.

Over the whole Parliamentary field, the most encouraging fact is that ideas are circulating again—real ideas, not snippets from textbooks; and this fresh thinking is most to be noticed in the Tory Party, next among the Liberals, and least in the Labour Party.

Answers to Many Questions See page 2

GENERAL: OBSERVER

1. "Never in the field of human conflict was so much owed by so many to so few."
2. George Washington: Speech to both Houses of Congress, Jan., 1790.
3. (a) Col. J. J. Llewellin; (b) Dr. W. R. Matthews; (c) Lord Gowrie; (d) Mikhail Ivanovich Kalinin; (e) Mr. R. M. Barrington-Ward.
4. (a) 80, b. Jan. 17, 1863; (b) 87, b. July 26, 1856; (c) 60, b. May, 1883; (d) 61, b. Jan. 30, 1882; (e) 43, b. June 25, 1900; (f) 44, b. Dec. 16, 1899.
5. Six: Antrim, Armagh, Down, Fermanagh, Londonderry, Tyrone.

DRAMA: IVOR BROWN

1. Five. The Merchant of Venice, the usurping Duke of Milan (Tempest), Sea Captain (Twelfth Night), Brother of Leonato (Much Ado), Father of Proteus (Two Gentlemen of Verona).
2. (a) David Garrick, 1769. (b) None. Garrick recited his own verses. (c) Boswell. (d) Foote.
3. (a) "Arms and the Man," 1894; (b) Golding Bright, subsequently play-agent to Barrie and others; (c) "I quite agree with you, my friend, but what are we two against a whole house?"
4. J. M. Barrie. "Jane Annie" (Savoy, 1893).
5. In "S.O.S." by Walter Ellis at St. James's Theatre, with Sir Gerald du Maurier, 1928.

FILMS: C. A. LEJEUNE

1. "The Terror," October, 1928.
2. (a, b, c) William Dieterle; (d) Clarence Brown; (e) Norman Foster.
3. "The Wise Little Hen."
4. Merle Oberon, Wendy Barrie, Elsa Lanchester, Binnie Barnes, Everley Gregg. Catherine of Aragon was a sub-title.
5. Mickey Rooney and Mickey Mouse.

ART: OSBERT LANCASTER

1. (a) Domenico Theotocopuli; (b) Carlo Pellegrini; (c) Jacopo Robusti; (d) Nicholson and Pryde.
2. (a) Rubens; (b) Gauguin; (c) Delacroix; (d) Courbet; (e) Vlaminck.
3. Ruskin of Cuyp.
4. (a) Mons. Ingres; (b) Correge; (c) Hunt; (d) Stewart; (e) Rousseau.
5. (a) Thackeray on the Crystal Palace; (b) T. S. Eliot on St. Magnus Martyr.

THE WAR: LIBERATOR

1. Battle of Lvov, September 17-18, 1939.
2. (a) Marshal Voroshilov—Field Marshal von Leeb; (b) Marshal Timoshenko—Field Marshal von Bock; (c) Marshal Budyenny—Field Marshal von Rundstedt.
3. 850.
4. Paris, Belgrade, Rome.
5. Germany was promised the completion of the greatest victory in her history by the end of 1941 by Hitler in his New Year's message on December 31, 1940.

LITERATURE: J. C. TREWIN

1. (a) "The Young Visiters" (Daisy Ashford); (b) "Delina Delaney" (Amanda M. Ros); (c) "The Diary of a Nobody" (G. and W. Grossmith).
2. (a) Robert Bridges; (b) Edmund Waller; (c) A. E. Housman; (d) A. C. Swinburne.
3. (a) "One World"; (b) "Wonderings"; (c) "None But the Lonely Heart."
4. (a) "To the Shade of a Friend" (William Wordsworth); (b) "The Contention of Ajax and Ulysses" ("The glories of our blood and State"), by James Shirley.
5. (a) Lady Catherine de Bourgh ("Pride and Prejudice"); (b) Daphne du Maurier's "Rebecca"; (c) Mr. Rochester ("Jane Eyre").

RADIO: TOM HARRISSON

1. Three: Sir Allan Powell, Captain Sir Ian Fraser, Lady Violet Bonham-Carter.
2. Often to improve reception.
3. January 4, 1938, in Arabic.
4. Japan. About 10 per cent of programme time.
5. Roughly ten shillings a minute. (But the talk has to be written first!)

OPEN AIR: SIR W. BEACH THOMAS

1. Grass snakes lay eggs. Adders are viviparous.
2. The long leaf-stalk is flattened at right angles to the plane of the leaf.
3. (a) A squirrel's nest, (b) a hare's layer.
4. The outer tail feathers.
5. Hollies bear male and female flowers on different trees.

MUSIC: WILLIAM GLOCK

1. A Mass based not on a given melody but on the composer's own.
2. (a) Sir Walter Parratt; (b) Sir Edward Elgar; (c) Sir Walford Davies; (d) Sir Arnold Bax.
3. Toccare, to beat: from the drums which accompanied brass fanfares of the late Middle Ages.
4. Henri Duparc.
5. (a) Schubert; (b) Milhaud; (c) Handel; (d) Aaron Copland; (e) Mozart; (f) Weber.

AIR: FREDERICK TOMLINSON

1. The flight lasted 12 seconds, covered a distance of 200 yards, and the aircraft reached an "altitude" of 4 feet.
2. The alternate violet and white stripes of the D.F.C. are one-eighth of an inch wide, and those of the D.F.M. one-sixteenth of an inch.
3. A Vice-Admiral is senior to an Air Vice-Marshal, being equivalent in rank to an Air-Marshal.
4. It possessed 3?? operational and training squadrons and more than 22,000 aircraft. Eighteen months later only twenty-five squadrons remained, so ardently was disarmament practised.
5. Germany had a four to one superiority in bombers, as many fighters as Britain and France together, and 1,200 troop carriers to the R.A.F.'s none.

WOMEN: ALISON SETTLE

1. Fourteen. Two: Florence Horsbrugh, Parliamentary Secretary to the Ministry of Health, and Ellen Wilkinson, Parliamentary Secretary to the Ministry of Home Security.
2. About 500,000.
3. In Crete between 1800 and 1200 B.C.
4. She retains British nationality on marrying a Soviet citizen, an American, a Frenchman. She loses it by marrying a Pole, Spaniard, or Swede.
5. Wooden-soled shoes and certain categories of stockings now need fewer coupons.

SPORT: R. C. ROBERTSON-GLASGOW

1. Twelve.
2. John Ball (of Hoylake). Eight wins: 1888, 1890, 1892, 1894, 1899, 1907, 1910, 1912.
3. (a) Dr. W. G. Grace; (b) G. L. Jessop; (c) E. M. Grace; (d) F. R. Spofforth.
4. William Lillywhite of Sussex (5 ft. 4 in. high, and bowled in braces!).
5. G. E. V. Crutchley (in 1912, at Lord's).

COMPANY MEETING

J. BROCKHOUSE & CO.

The forty-sixth annual general meeting of J. Brockhouse and Company, Limited, was held last Wednesday at West Bromwich.

Mr. J. T. Brockhouse, J.P., chairman and managing director, said that the balance-sheet showed the continued success of the company during the past year. It was essential that thought should be given to the methods that would be adopted in re-building the structure of trade after the war was won. Industry would have a large part to play, and it was only through industry that improved standards of life could be made a possibility. It was clear that we had got to be competitive in the world's markets. The whole situation appeared to be in co-operation.

They had a number of new products to bring on to the market. They would be introducing a range of municipal vehicles, and they felt that they had a large field to explore at home, and possibly abroad, with the patent Lewin road-sweeper, the universal sweepers and the Lewin compressor refuse collectors. They had for many years been large producers of cold rolled-steel sections, and the introduction of pre-fabricated building structures, particularly houses, had brought new and varied uses for that product. They were manufacturers of cooking stoves, cooking utensils, household baths and many other domestic products which undoubtedly would be in great demand after the war. For these reasons and others he did not see why the company should not continue to extend in the future as it had done during the past twenty years; in fact, under normal conditions its progress should be even greater.

The amount of profit brought in for the year is shown as £124,791. This corresponds with the figure of £90,469 last year if taken on the same basis after deduction of taxation. Your directors recommend that the available balance of £??,230 be dealt with as follows:—That the dividends already paid, as per the directors' report, be confirmed and that a final dividend of 12½ per cent. less tax be paid on the Ordinary stock, making a total for the year of 20 per cent. less tax.

The report was adopted.

THIS PAGE IS DECLASSIFIED IAW EO 13526

Ferment Spreads

The Tory Reform Committee's best achievement, apart from performances in debate, has been the production of a manifesto—"Forward—by the Right"—to explain the progressive policies of the Tory Left. With great boldness and vigour in Parliamentary debate and action, these young Conservatives can be a powerful force.

These beginnings of intellectual ferment in the Conservative Party have spread to its Centre. The Progress Trust has been formed, an forestry; another will shortly deal with the effect of taxation on woodlands. Meanwhile, the Government has refused to be committed on everything. It has barely been brought so far over agriculture as to agree to discuss policies for the transitional and post-war periods.

Over the whole Parliamentary field, the most encouraging fact is that ideas are circulating again—real ideas, not snippets from text-books; and this fresh thinking is most to be noticed in the Tory Party, next among the Liberals, and least in the Labour Party.

Answers to Many Questions See page 2

GENERAL: OBSERVER

1. "Never in the field of human conflict was so much owed by so many to so few."
2. George Washington: Speech to both Houses of Congress, Jan., 1790.
3. (a) Col. J. J. Llewellin; (b) Dr. W. R. Matthews; (c) Lord Gowrie; (d) Mikhail Ivanovich Kalinin; (e) Mr. R. M. Barrington-Ward.
4. (a) 80, b. Jan. 17, 1863; (b) 87, b. July 26, 1856; (c) 60, b. May, 1883; (d) 61, b. Jan. 30, 1882; (e) 45, b. June 25, 1900; (f) 44, b. Dec. 16, 1899.
5. Six: Antrim, Armagh, Down, Fermanagh, Londonderry, Tyrone.

DRAMA: IVOR BROWN

1. Five: The Merchant of Venice, the usurping Duke of Milan (Tempest), Brother Sea Captain (Twelfth Night), Brother of Leonato (Much Ado), Father of Proteus (Two Gentlemen of Verona).
2. (a) David Garrick, 1769; (b) None. Garrick recited his own verses. (c) Boswell. (d) Foote.
3. (a) "Arms and the Man," 1894; (b) Golding Bright, subsequently play-agent to Barrie and others; (c) "I quite agree with you, my friend, but what are we two against a whole house?"
4. J. M. Barrie: "Jane Annie" (Savoy, 1893).
5. In "S.O.S." by Walter Ellis at St. James's Theatre, with Sir Gerald du Maurier, 1928.

FILMS: C. A. LEJEUNE

1. "The Terror," October, 1928.
2. (a, b, c) William Dieterle; (d) Clarence Brown; (e) Norman Foster.
3. "The Wise Little Hen."
4. Merle Oberon, Wendy Barrie, Elsa Lanchester, Binnie Barnes, Everley Gregg. Catherine of Aragon was a sub-title.
5. Mickey Rooney and Mickey Mouse.

ART: OSBERT LANCASTER

1. (a) Domenico Theotocopuli; (b) Carlo Pellegrini; (c) Jacopo Robusti; (d) Nicholson and Pryde.
2. (a) Rubens; (b) Gauguin; (c) Delacroix; (d) Courbet; (e) Vlaminck.
3. Ruskin of Cuyp.
4. (a) Mons. Ingres; (b) Corrège; (c) Hunt; (d) Stewart; (e) Rousseau.
5. (a) Thackeray on the Crystal Palace; (b) T. S. Eliot on St. Magnus Martyr.

THE WAR: LIBERATOR

1. Battle of Lvov, September 17-18, 1939.
2. (a) Marshal Voroshilov—Field Marshal von Leeb; (b) Marshal Timoshenko—Field Marshal von Bock; (c) Marshal Budyenny—Field Marshal von Rundstedt.
3. 850.
4. Paris, Belgrade, Rome.
5. Germany was promised the completion of the greatest victory in her history by the end of 1941 by Hitler in his New Year's message on December 31, 1940.

LITERATURE: J. C. TREWIN

1. (a) "The Young Visiters" (Daisy Ashford); (b) "Delina Delaney" (Amanda M. Ros); (c) "The Diary of a Nobody" (G. and W. Grossmith).
2. (a) Robert Bridges; (b) Edmund Waller; (c) A. E. Housman; (d) A. C. Swinburne.
3. (a) "One World"; (b) "Wonderings"; (c) "None But the Lonely Heart."
4. (a) "To the Spade of a Friend" (William Wordsworth); (b) "The Contention of Ajax and Ulysses" ("The glories of our blood and State"), by James Shirley.

5. (a) Lady Catherine de Bourgh ("Pride and Prejudice"); (b) Daphne du Maurier's "Rebecca"; (c) Mr. Rochester ("Jane Eyre").

RADIO: TOM HARRISSON

1. Three: Sir Allan Powell, Captain Sir Ian Fraser, Lady Violet Bonham-Carter.
2. Often to improve reception.
3. January 4, 1938, in Arabic.
4. Japan. About 10 per cent. of programme time.
5. Roughly ten shillings a minute. (But the talk has to be written first!)

OPEN AIR: SIR W. BEACH THOMAS

1. Grass snakes lay eggs. Adders are viviparous.
2. The long leaf-stalk is flattened at right angles to the plane of the leaf.
3. (a) A squirrel's nest; (b) a hare-layer.
4. The outer tail feathers.
5. Hollies bear male and female flowers on different trees.

MUSIC: WILLIAM GLOCK

1. A Mass based not on a given melody but on the composer's own.
2. (a) Sir Walter Parratt; (b) Sir Edward Elgar; (c) Sir Walford Davies; (d) Sir Arnold Bax.
3. Toccare, to beat: from the drums which accompanied brass fanfares of the late Middle Ages.
4. Henri Duparc.
5. (a) Schubert; (b) Milhaud; (c) Handel; (d) Aaron Copland; (e) Mozart; (f) Weber.

AIR: FREDERICK TOMLINSON

1. The flight lasted 12 seconds; covered a distance of 200 yards, and the aircraft reached an "altitude" of 4 feet.
2. The alternate violet and white stripes of the D.F.C. are one-eighth of an inch wide, and those of the D.F.M. one-sixteenth of an inch.
3. A Vice-Admiral is senior to an Air-Vice-Marshal, being equivalent in rank to an Air-Marshal.
4. It possessed 373 operational and training squadrons and more than 22,000 aircraft. Eighteen months later only twenty-five squadrons remained, so ardently was disarmament practised.
5. Germany had a four to one superiority in bombers, as many fighters as Britain and France together, and 1,200 troop carriers to the R.A.F.'s none.

WOMEN: ALISON SETTLE

1. Fourteen. Two: Florence Horsbrugh, Parliamentary Secretary to the Ministry of Health, and Ellen Wilkinson, Parliamentary Secretary to the Ministry of Home Security.
2. About 500,000.
3. In Crete between 1800 and 1200 B.C.
4. She retains British nationality on marrying a Soviet citizen, an American, a Frenchman. She loses it by marrying a Pole, Spaniard, or Swede.
5. Wooden-soled shoes and certain categories of stockings now need fewer coupons.

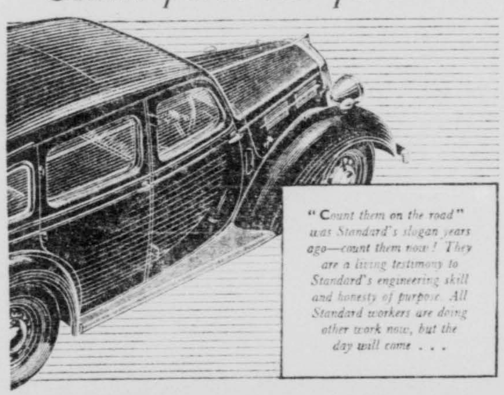
SPORT: R. C. ROBERTSON-GLASGOW

1. Twelve.
2. John Ball (of Hoylake). Eight wins: 1888, 1890, 1892, 1894, 1899, 1907, 1910, 1912.
3. (a) Dr. W. G. Grace; (b) G. L. Jessop; (c) E. M. Grace; (d) F. R. Spofforth.
4. William Lillywhite, of Sussex (5 ft. 4 in. high, and bowled in braces!).
5. G. E. V. Crutchley (in 1912, at Lord's).

COMPANY MEETING

J. BROCKHOUSE & CO.

The forty-sixth annual general meeting of J. Brockhouse and Company, Limited, was held last Wednesday at West Bromwich.



Mr. J. T. Brockhouse, J.P., chairman and managing director, said that the balance-sheet showed the continued success of the company during the past year. It was essential that thought should be given to the methods that would be adopted in rebuilding the structure of trade after the war was won. Industry would have a large part to play, and it was only through industry that improved standards of life could be made a possibility. It was clear that we had got to be competitive in the world's markets. The whole situation appeared to lie in co-operation.

They had a number of new products to bring on to the market. They would be introducing a range of municipal vehicles, and they felt that they had a large field to explore at home, and possibly abroad, with the patent Lewin road-sweeper, the universal sweepers and the Lewin compressor refuse collectors. They had for many years been large producers of cold rolled-steel sections, and the introduction of pre-fabricated building structures, particularly houses, had brought new and varied uses for that product. They were manufacturers of cooking stoves, cooking utensils, household baths and many other domestic products which undoubtedly would be in great demand after the war. For these reasons and others he did not see why the company should not continue to extend in the future as it had done during the past twenty years; in fact, under normal conditions its progress should be even greater.

The amount of profit brought in for the year is shown as £124,791. This corresponds with the figure of £90,469 last year if taken on the same basis after deduction of taxation. Your directors recommend that the available balance of £226,250 be dealt with as follows:—That the dividends already paid, as per the directors' report, be confirmed and that a final dividend of 12½ per cent. less tax be paid on the Ordinary stock, making a total for the year of 20 per cent. less tax.

The report was adopted.

PROFILE—GWILYM LLOYD GEORGE

CHRISTMAS is traditionally and naturally the season of the blazing log. There is one man who will be glad to see you burn it, but will hate to see too drastic a raid upon the Yule coal. He is, of course, the Minister of Fuel and Power.

It is not easy to be the son of a very great man: people expect so much, too much, of the child. From the moment Gwilym Lloyd George entered public life he showed great common sense in not trying to emulate his father, either in style of speaking or in action. He made no attempt to try on his father's breeches, because he knew they would not fit! This lesson, and some others, he may have learnt from his very wise mother. Father and son differ in physique and in temperament. They resemble each other in sympathy for the under-dog and in courage when it is most needed. Gwilyn (as he is affectionately called, or sometimes "G") has his mother's native shrewdness and common sense, abundant humour, and no excessive crusading zeal. Captain Fitzroy thought of him as a possible Speaker. It is no secret that, when Lord Woolton recently became Minister of Reconstruction, the Prime Minister offered the position of Minister of Food to Gwilym Lloyd George. But he is no quitter in times of difficulty and he chose to remain at the Ministry of Fuel and Power, with its intractable problems.

*

Similarly, in 1931, at a time when he was a sincere exponent of Free Trade doctrine in the Liberal ranks and only a few months after he had first set foot on the ministerial ladder as Parliamentary Secretary of the Board of Trade, he resigned the position on a question of high principle because he disagreed with the policy of the Government of the day. Dame Margaret would have done the same had she been in office.

Gwilym Lloyd George was born on December 4, 1894, into a radical home in Criccieth, North Wales. Both his paternal and maternal forbears came from agricultural and Nonconformist stock. His father had been elected to Parliament in 1890, and the boy's home was sometimes in Criccieth and sometimes in London. But as he grew up to speak both Welsh and English his return to his Welsh home and the friends of his boyhood has always been a delight to him. He was educated at Eastbourne College, and went from there to Jesus College, Oxford. His university career was interrupted by the Great War. He volunteered for the Army and saw active service in France as a gunner and major of his battery until the end of the war.

*

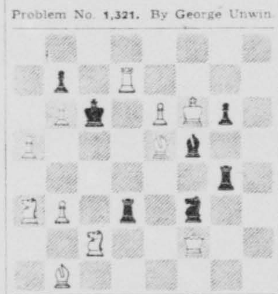
In 1922 he was returned as Liberal Member for Pembrokeshire, which pleased his father, who has ancestral associations with the county. If he has tasted success, he has also experienced set-backs—and can take them. In 1924 he lost Pembroke and was out of Parliament for five years, returning in 1929 and remaining there ever since. In all his ups and downs he has enjoyed the support of an endearing wife, a lady as attractive as her Welsh name, Gwenfron, and her native vale of Clwyd.

He is fond of sport. In more normal times he spent his happiest hours in a small fishing boat off Criccieth or Pembroke with some of his "cronies"; or playing cricket for his old school at Eastbourne, or at Lord's. He has played forward for the London Welsh at Rugby football. He enjoys shooting and golf. Among his family and friends he can be a most amusing mimic of the oddities of the Great, and he could have won distinction on the stage in social comedy. During the last war he met an Australian. "What's your name?" asked the Australian. "Lloyd George," replied he drily. "What's yours?" asked Gwilym Lloyd George. "George the Fifth!" replied the Australian.

DRAWN BY STANLEY PARKER

At the beginning of this war he joined the London Welsh Regiment as a major, and only left when he was appointed Parliamentary Secretary to Lord Woolton at the Ministry of Food—a position he filled with great success. It bristled with parliamentary difficulties, but Gwilym is a good mixer and a fountain of happiness. Hence he is a favourite alike in the Lobby, the smokeroom, and the Chamber. As his big figure stood at the table of the House of Commons, his personality and manner were pleasing, his voice soft and kindly; he plainly wanted to be helpful.

*



Whilst he was never discourteous or aggressive even to his strongest critics, he knew how and when to be firm, though his firmness was wrapped up in the velvet of wit and humour. It is a possible criticism that, in his easy conversational style, he so lowers his voice at times that he becomes inaudible except to a few.

To-day, as the first Minister of Fuel and Power, he has one of the most difficult tasks in the Government—and as the Prime Minister recently said, a thankless one. His appointment to this Ministry met with the unanimous approval of all parties. Everybody to-day knows of the difficulties which exist in raising coal, and the vital need for increased production. Through his personal contact with the miners themselves he has proved his honesty of purpose, and demonstrated his genuine interest in their welfare. He can be relied on to see that fair play is given to both sides. If anyone can produce the coal, it is Gwilym Lloyd George.

White plays and mates in three moves

No. 1,321, the last of the competition, is set under the special rules for Section A: Keys only or claims of no solution for Section B. No. 1,320. By J. Stewart. 3 moves. Key K—K2, 20 marks. If 1. P—K6, 2. R x B+, etc.; 1. P x P, 2. Q x P; 1. R x P, 2. Q x RP+. Neat specimen of a Block with added play, shown in the first variation.

A KING'S KNIGHT GAME

Here is a King's Knight Game played recently at Syracuse (N.Y., not Sicily). White: A. W. Wood. Black: I. A. Horowitz. 1. P—K4 P—K4, 2. Kt—KB3 Kt—QB3, 3. P—B4 (a) B—B4, 4. Kt—B3 Kt—B3, 5. P—Q3 (b) Kt—KKt5, 6. P—Q4 P x P, 7. Kt—Q5 P—Q6, 8. B—K3 Kt x B, 9. P x Kt Kt—Kt5, 10. B x P Kt x Kt, 11. KP x Kt Castles (c), 12. P—K4 P—Q3, 13. Q—Kt3 P—B4, 14. Castles Q—B3, 15. Q—B2 P—QKt4, 16. P x KtP P—QR3, 17. P—QR4 RP x P, 18. B x P P x P, 19. Kt—Q2 (d) Q—R3, 20. Q x P B—B4, 21. Q—K2 Q—B3, 22. P—KKt4 (e), Q—B6+, 23. Resigns (f). Notes: (a) Inferior, blocking the path of his KB, and weakening Q4. (b) Loses a P. (c) Inducing Q side Castling, but B x P is simple and good. (d) Hoping for P—K6, when 20. Kt—K4 would relieve the pressure by exchanges. (e) He should play Q—B4 or Kt—B3, when Black has still to find a win. (f) P x Q B—R6 mate, a brilliant old trap. Horowitz won the National Open Championship at this meeting.

Bridge

By OUR CORRESPONDENT

I MAKE no apology for the following hand, which is of a type about which I have frequently written, and I have no doubt many of you will come across instances during the Festive (sic) Season—and afterwards.

Contract: "Five Clubs," by South. E.-W. having bid up to "Three Hearts." West opened with the 10 of Hearts.

♠ J, 10, 9, 5
♡ A, 4
♢ A, K, 5
♣ 10, 6, 4, 2

N
W E
S

♠ A, 4, 2
♡ 9, 7
♢ Q, 6, 2
♣ A, Q, J, 7, 3

South placed East with the King of Clubs and one of the Spade honours and played accordingly. He cleared trumps, finessing the 10 and J, and caught East's King. He played out K and Q of Diamonds, then went for Spades, lost a trick to West's Queen of Spades and another to East's Jack of Hearts. Then to his dismay he also found the King of Spades with West, and was one down.

North, having, in his best avuncular manner, said that in his opinion the contract was there anyhow, was implored by South to enlighten him.

North: "After drawing trumps and taking two rounds of Diamonds, why not take a third round and eliminate the suit?" (The word "eliminate" began to ring a bell with South.) "Now put East in with a Heart, and he, poor fellow, must almost certainly lead a Spade, which you allow to run. Now, if West leads another Spade you are home and dried; if he leads a Heart or a Diamond you get a ruff in Dummy and get rid of your own losing Spade. So what?"

South, with that charming old-world grace for which Souths in Bridge problems are famous, said:

ACROSS.—1. Dragon-fly; 6.* Parma; 9. White hair (Henry IV., Pt. ii., V.v. 50); 10. Nabob; 11. You next; 12. Earlier; 13. Ear; 14. Dimeter; 17. Steeper; 19. S-urgent; 22. Streets (Ps. 144); 24. Arc; 25. Echelon; 26. Umpteen; 29.* Swa-m-p; 30. Extricate (see next two clues); 31. Liege (Cont. in clue); 32. Twenty-one (3 dn. 3 x 7). **DOWN.**—1. Downy; 2. Adieu; 3. Overeat; 4. Flatter; 5. Yorkers; 6. Panurge (Rabelais); 7. Rabbi-t Pie; 8.* Ambergris; 14.* Dispersal; 15. March Hare; 16. Eon; 18. Tat; 20. El-lip-se; 21. Tangent; 22. Scuttle; 23. Repaint; 27. Erato; 28. Nie-ce.

* Anagram.

"How right you are, my dear North. Please accept my sincere regrets for my failure to make my contract."

DOUBLE ACROSTIC

Soon comes the end of '43:
But '44 will longer be.

1. Stone-fruit—but, you must own, A fruit that has no stone.
2. A most unpleasant sight: (A stye you may think right.)
3. Of me no simian Has a high opinion.
4. A bird (like Aphrodite's dove) That's absolutely full of love.

[Solution next week.]

The Meteor

SUCH is this, and such is that,
To man's too-tidy mind.
He treads the earth, and studies it,
And has it all defined.

Yet sometimes he will see the sky
Seared with a falling fire,
And all his graphs are given the lie
By hunger and desire.

Then science with its dogma flows
Like water into sand,
And all that man has learned, he knows
He'll never understand.

RICHARD CHURCH.

NO ORDINARY DEAF AID can compare with a "Belclere" High Efficiency Valve Amplifier.—Manufactured by John Bell & Croyden, 51, Wigmore-st., London, W.1, and 117, High-st., Oxford.

ARTORAL, the 2 minute cleanser for artificial teeth. Keeps the mouth healthy and the breath sweet. 2s. 1½d. from Boots, Stores and Chemists, or write Artoral, 357, Kennington-lane, S.E.11.

HOSPITAL NURSING affords an opportunity of sharing in the war effort while qualifying for a peace-time career. Educated girls wishing to become student nurses can obtain full information from the Nursing Recruitment Centre, 21, Cavendish-square, W.1. Tel.: Langham 4362.

THERE'S MUCH extra nourishment in Bermaline Bread. It restores energy, invariably remedies digestive troubles, and pleases everyone because it is so delicious. Will help save shipping, too. Ask Baker or write Bermaline, Fairley-street, Glasgow, S.W.1.

AN INECTO treatment will restore your hair to its natural colour. Consultations free. Phyllis Earle, Ltd., 32, Dover-street, W.1. REGent 7541.

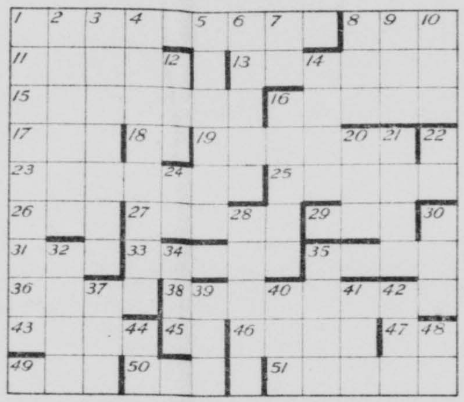
GOLD, DIAMONDS, EMERALDS, Jewellery, Silver, &c., Bought for Cash. Highest Prices Given. Call or send registered post. Spink and Son, Ltd., the all-British firm (Est. 1772), 5-7, King-st., St. James's, London, S.W.1. Tel., Whitehall 5275 (4 lines).

CONVERT your Gold, Silver, Diamonds, Jewellery into cash now while prices are high. Registered parcels receive same attention as personal transactions.—Harrods Ltd., London, S.W.1. Sloane 1234.

CARPETS & RUGS of distinction purchased. Best prices given. Perez, English and Persian Carpet Specialists, 168, Brompton-road, S.W.3 (Ken. 9878) and 97, New Bond-st., W.1 (Mayfair 7008).

HIGH-GRADE SALOON or Limousine Car urgently required. Must be privately owned and in first-class condition.—Write Box 4406, c.o. OBSERVER, London, E.C.4.

BROOKLANDS of BOND-STREET would like particulars of any good car for disposal.—103, New Bond-street, W.1.



A GAME of cards, a restful spell, Tom Long, a smoke, and all is well.

CROSSWORD (TORQUEMADA STYLE)

No. 924.—By "ARGENT"

1 Nine seats for the stupid
8 See 26
11 Spruce
13 Henry King was apt to get his teeth into it
15 Dog debts
16 This girl's heart is easily broken
17 Set was the end of me with 49
18 Same person either way
19 Sounds as if it might be a thriller, but it's only a filler
23 Habitual becomes negligence
25 To-day's metaphysics with 10
26 Feudal oriental lord with 8 ac.
27 Can this be allowed? Yes, so to speak
29 After 22 our islands were both happy and fortunate.
31 —and free from all this
33 rev. Turn out
35 See 38
36 On 14 rev.'s head
38 If you want broken bottles you can get two here with 35
43 Let me go back to it
45 God half goddess
46 Box of a dozen
47 Wants it to be one
49 See 17 and 9
50 After 32 more generally seen even more so
51 Theotocopuli after 24

1 Not very well put together
2 Often caused by half
3 Kind of back-scratcher
4 If light leaves leaves go light
5 Cuts back before company for a coat
6 Singular property so propounded
7 44
8 rev. Keeps compass flat before 30
9 Revolt after 49
10 See 25
12 rev. Occasional behaviour of Phyllis
14 rev. See 36
16 Precedes Pomp and Circumstance
20 rev. Disturbing part of 2
21 Put up first for a writer
22 See 29
24 See 51
28 Here was said "Dr. Livingstone, I presume?"
30 See 8
32 See 50
34 Runs across a continent
35 Long-lived fish?
37 A frightful apparition. (But it isn't)
39 Like Amaryllis?
40 Pull or pole
41 Do you colour?
42 rev. Actor's last words
44 7
48 Quite a small number

LAST WEEK'S SOLUTION AND NOTES

ACROSS.—1, Dragon-fly; 6,* Parma; 9, White hair (Henry IV., Pt. ii., V.v. 50); 10, Nabob; 11, You next; 12, Earlier; 13, Ear; 14, Dimeter; 17, Steeper; 19, S-urgent; 22, Streets (Ps. 144); 24, Arc; 25, Echelon; 26, Umpteen; 29,* Swa-m-p; 30, Extricate (see next two clues); 31, Liege (Cont. in clue); 32, Twenty-one (3 dn. 3 x 7). **DOWN.**—1, Downy; 2, Adieu; 3, Overeat; 4, Flatter; 5, Yorkers; 6, Panurge (Rabelais); 7, Rabbi-t Pie; 8,* Ambergris; 14,* Dispersal; 15, March Hare; 16, Eon; 18, Tat; 20, El-lip-se; 21, Tangent; 22, Scuttle; 23, Repaint; 27, Erato; 28, Nie-ce.

* Anagram.

"How right you are, my dear North. Please accept my sincere regrets for my failure to make my contract."

DOUBLE ACROSTIC

Soon comes the end of '43:
But '44 will longer be.

1. Stone-fruit—but, you must own,
A fruit that has no stone.
2. A most unpleasant sight:
(A stye you may think right.)
3. Of me no simian
Has a high opinion.
4. A bird (like Aphrodite's dove)
That's absolutely full of love.

[*Solution next week.*]

The Meteor

SUCH is this, and such is that,
To man's too-tidy mind.
He treads the earth, and studies it,
And has it all defined.

Yet sometimes he will see the sky
Seared with a falling fire.
And all his graphs are given the lie
By hunger and desire.

Then science with its dogma flows
Like water into sand,
And all that man has learned, he knows
He'll never understand.

LEAGUE GAMES

Blackpool Win Again

Blackpool yesterday consolidated their claim to be the best team in the North, if not in the whole country, by beating Southport 5—0 and carrying off the League North Championship for the third season in succession. Although winning 3—1 at Bolton, Manchester United exerted themselves in vain.

Liverpool and Doncaster each won and take third and fourth positions.

FOOTBALL LEAGUE NORTH.

Aston Villa	3	Leicester C.	1
Barnsley	2	Chesterfield	4
Blackburn R.	5	Oldham	2

RACING— **TURF HISTORY**

Preparing for a Post-War Boom

By OUR SPECIAL CORRESPONDENT

I put forward a plea a short time ago for the impletion of some of the more important of the Reorganisation Committee's recommendations. In particular I laid stress on the necessity for some form of centralisation whereby there could be a limitation of the number of racecourses and the increased use of fewer and better courses.

* * *

The Stewards of the Jockey Club have now taken the first step with that end in view. A private company has been formed with a nominal capital of £10,000, and one of the main objects is to take over some of the principal courses. What in the fullness of time the scheme will amount to is not yet known, but it is to be assumed there is every intention of carrying out the suggestions of the Reorganisation Committee.

* * *

I happen to know that several people who were invited by the Committee to express their views thought the ideal could only be achieved if the Jockey Club took over all the racecourses and ran them on a non-profit-making basis. There are only five such courses in existence at the present time. All the others are run with the main object of providing dividends for the shareholders. There are a few exceptions such as Doncaster, which is run by a Race Committee appointed by the local Town Council. Part of the profits are set aside to help the rates of the town. Goodwood is entirely privately owned.

* * *

Doncaster in St. Leger week, Goodwood's one four-day meeting, and Chester's three-day fixture are by way of being historic landmarks in the sporting lore of the country. It will be interesting to know from what angle negotiations are to be conducted in those cases. Most of the others are owned by private or public companies, and it is not to be anticipated that any serious difficulties will arise. The shareholders will receive a reasonable return on their capital.

* * *

The main alteration will be that there will be no shareholders to consider when the plan is complete, and with the Jockey Club responsible for running the meetings, there will be a considerable reduction in overhead charges. At present there is much overlapping in that direction, and all that can be avoided. It should not be thought the millennium has been reached by the formation of this company. It will be many years before the borrowed money can be repaid, and all that will be attempted in the initial stage is to meet the fixed charges in respect of the borrowed money.

* * *

The Reorganisation Committee was satisfied that such an organisation would fit into the present system of horse racing, and there is not the slightest doubt that this first action opens a new page in British Turf history. The primary objects are to help owners either by reducing their expenses or by increasing the prize-money. Then, as everything gets into working order, the public will have to be considered.

* * *

Many suggestions have been made to provide cheaper and more comfortable accommodation for the public, but it may be a considerable time before the money is forthcoming to accomplish all that the stewards of the Jockey Club have in mind.

* * *

For the present one can congratulate the Jockey Club on taking such a bold step, and if the boom that is anticipated in immediate post-war years is realised it may well be that the rulers of the Turf will feel they are justified in tackling such a tremendous enterprise. At this stage all who have the true interests of the Turf at heart will wish them well.

RACING IN IRELAND

By OUR SPECIAL CORRESPONDENT

Dublin, Saturday

The Turf Club and I.N.H.S. Committee, acting jointly, adopted several of the Irish Racing Commissioners' recommendations, but decided to take no action on the questions of centralisation or the acquisition of racecourses.

The commission which had been presided over by Lord Adare, urged the acquisition of the country's racecourses strongly, and expressed the hope that when more substantial funds were made available, either through the development of mechanical betting or otherwise, such a scheme might become practicable and should be proceeded with. In an appendix to the report even a mode of detailed procedure was suggested.

This acquisition of courses so as to ensure their uniform control by one governing body had been in the minds of several hard-thinking and far-seeing men in the racing and breeding business long before the appointment of a commission was even mooted.

Apparently it has appeared altogether too big a matter for such moments as we are passing through now, but the institution of the Jockey Club Company is not unlikely to bring such an interesting and wholly novel matter to the immediate front again.

Golden Jack does not run in the December Steeplechase at Leopardstown, on Monday, and in his absence Prince Regent should not have difficulty in winning the event for Mr. Rank. Verbatim runs instead of Golden Jack for Miss Paget.

CHRISTMAS DAY SWIMMING

The members of the Serpentine S.C. decided the eightieth Christmas race over the usual 100 yards course in the lake, Hyde Park, yesterday. Result: G. Brewster (35 sec. start) 1, Sergt. A. Goffrey [illegible] Boulton (10 sec.) 3.

SPORTING PRINTS

MELBOURNE INMAN

He was the best of his time.

It would be an empty tribute to suggest that Melbourne Inman was no more than that. In his time Inman beat many of his opponents before the game was begun. That is a better tribute, for he was a character, almost Dickensian, and character won.

Of the many types of ball games billiards, it has been said, is the most difficult of all to play with success. Temperament provides the acid test, not merely playing, or scoring, ability. Inman beat more finished players than himself, first because he made up his mind he would not lose, and, second, because he conveyed in some mysterious way, to the other mind, that he was not to be beaten.

The preliminaries to an important match are exciting and maybe slightly unnerving. Inman never conveyed nerves. They were not part of his make-up. He knew the open game thoroughly and he always seemed to leave his opponent with the impression that he knew much more about it than anyone. He had his day and richly he deserved it. It lasted for some time and until he was found out by others who had developed a faster scoring technique he more than held his own. He won the championship five times [illegible]

[illegible]

... Stevenson in the final of 1919 and then came new ideas and his eclipse. But up to then what a great player he was. As he would say plaintively, It was this Chinese billiards which spoilt the game. He referred to the development of close cannon play. But still, at the age of [illegible], he is doing splendid work in exhibition games for the Red Cross.

ICE HOCKEY

Canadiens Maintain Big Lead

New York, Saturday

Montreal Canadiens still hold a big lead in the National Hockey League. Toronto Maple Leafs, second, and Boston Bruins, third, appear to be drawing away from the rest of the field.

Toronto are seven points behind the Canadiens, one point ahead of Boston, who in turn are a point more than Chicago Black Hawks.

During the week Toronto won two of their three games and Boston broke even. Chicago Hawks and Detroit Red Wings were only once successful in three matches. The Leafs have scored [illegible] goals in [illegible] games, but Boston lead the league with [illegible] goals in 20 games.

Detroit, who before defeating New York Rangers on Thursday, had won only one of seven games, are only a shadow of the club that won the Stanley Cup last season. Their star goalkeeper, Jack Mowers, is greatly missed.—Reuter.

The Highgate Life-Buoys held their forty-first annual Christmas Morning fifty yards handicap for the "Osborne" Trophy in Highgate Bathing Pond. A. Reynolds [illegible]
